- Properties window - a standard Visual Studio Properties window, where the properties of the edited table are displayed. Use the Properties window to set the table properties.

Each of these areas is discussed in more detail in subsequent sections.

To save changes you have made in the Table Designer, use either SAVE or SAVE ALL button of the Visual Studio main toolbar, or just press **Ctrl+S**. If you have not already named the table you will be prompted to do so.

Figure 22.6. Choose Table Name

Once created you can view the table in the Server Explorer.

Figure 22.7. Newly Created Table

The Table Designer main menu enables you to set a Primary Key column, edit Relationships such as Foreign Keys, and create Indexes.

Figure 22.8. Table Designer Main Menu

22.2.3.2.1. Column Editor

You can use the Column Editor to set or change the name, data type, default value, and other properties of a table column. To set

the focus to a needed cell of a grid, use the mouse click. Also you can move through the grid using **Tab** and **Shift+Tab** keys.

To set or change the name, data type, default value and comment of a column, activate the appropriate cell and type the desired value.

To set or unset flag-type column properties (**NOT NULL**, auto incremented, flags), check or uncheck the corresponding check boxes. Note that the set of column flags depends on its data type.

To reorder columns, index columns or foreign key columns in the Column Editor, select the whole column you wish to reorder by clicking the selector column on the left of the column grid. Then move the column by using **Ctrl+Up** (to move the column up) or **Ctrl+Down** (to move the column down) keys.

To delete a column, select it by clicking the selector column on the left of the column grid, then press the **Delete** button on a keyboard.

22.2.3.2.2. Editing Indexes

Indexes management is performed using the **INDEXES/KEYS** dialog.

To add an index, select **TABLE DESIGNER**, **INDEXES/KEYS...** from the main menu, and click **ADD** to add a new index. You can then set the index name, index kind, index type, and a set of index columns.

Figure 22.9. Indexes Dialog

To remove an index, select it in the list box on the left, and click the **DELETE** button.

To change index settings, select the needed index in the list box on the left. The detailed information about the index is displayed in the panel on the right hand side. Change the desired values.

22.2.3.2.3. Editing Foreign Keys

Foreign Keys management is performed using the **FOREIGN KEY RELATIONSHIPS** dialog.

To add a foreign key, select **TABLE DESIGNER, RELATIONSHIPS...** from the main menu. This displays the **FOREIGN KEY RELATIONSHIP** dialog. Click ADD. You can then set the foreign key name, referenced table name, foreign key columns, and actions upon update and delete.

To remove a foreign key, select it in the list box on the left, and click the **DELETE** button.

To change foreign key settings, select the required foreign key in the list box on the left. The detailed information about the foreign key is displayed in the right hand panel. Change the desired values.

Figure 22.10. Foreign Key Relationships Dialog

22.2.3.2.4. Column Properties

The **COLUMN PROPERTIES** tab can be used to set column options. In addition to the general column properties presented in the Column Editor, in the **COLUMN PROPERTIES** tab you can set additional properties such as Character Set, Collation and Precision.

22.2.3.2.5. Table Properties

To bring up Table Properties select the table and right-click to activate the context menu. Select **PROPERTIES**. The **TABLE PROPERTIES** dockable window will be displayed.

Figure 22.11. Table Properties Menu Item

The following table properties can be set:

- Auto Increment
- Average Row Length
- Character Set
- Collation
- Comment
- Data Directory
- Index Directory
- Maximum Rows
- Minimum Rows
- Name
- Row Format
- Schema
- Storage Engine

The property **Schema** is read only.

Figure 22.12. Table Properties

22.2.3.3. Editing Views

To create a new view, right-click the Views node under the connection node in Server Explorer. From the node's context menu, choose the CREATE VIEW command. This command opens the SQL Editor.

Figure 22.13. Editing View SQL

```
mysql://localhost/world/View1 Start Page
CREATE VIEW View1
/*
(column1, column2)
*/
AS /* select statement */
```

You can then enter the SQL for your view.

Figure 22.14. View SQL Added

```
mysql://localhost/world/View1* Start Page
CREATE VIEW CityView AS SELECT ID, Name FROM City;
```

To modify an existing view, double-click a node of the view you wish to modify, or right-click this node and choose the ALTER VIEW command from a context menu. Either of the commands opens the SQL Editor.

All other view properties can be set in the Properties window. These properties are:

- Catalog
- Check Option

- Definer
- Definition
- Definer
- Is Updateable
- Name
- Schema
- Security Type

Some of these properties can have arbitrary text values, others accept values from a predefined set. In the latter case you set the desired value with an embedded combobox.

The properties **Is Updatable** and **Schema** are readonly.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**.

Figure 22.15. View SQL Saved

22.2.3.4. Editing Stored Procedures and Functions

To create a new stored procedure, right-click the **STORED PROCEDURES** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE ROUTINE** command. This command opens the SQL Editor.

Figure 22.16. Edit Stored Procedure SQL

```
mysql://localhost...oredProcedure1 Start Page
CREATE PROCEDURE StoredProcedure1
/*
(
parameter1 INT
OUT parameter2 datatype
)
*/
BEGIN
END|
```

To create a new stored function, right-click the **FUNCTIONS** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE ROUTINE** command.

To modify an existing stored routine (procedure or function), double-click the node of the routine you wish to modify, or right-click this node and choose the **ALTER ROUTINE** command from the context menu. Either of the commands opens the SQL Editor.

To create or alter the routine definition using SQL Editor, type this definition in the SQL Editor using standard SQL. All other routine properties can be set in the Properties window. These properties are:

- Body
- Catalog
- Comment
- Creation Time
- Data Access
- Definer
- Definition
- External Name
- External Language
- Is Deterministic
- Last Modified
- Name
- Parameter Style
- Returns
- Schema
- Security Type
- Specific Name
- SQL Mode
- SQL Path
- Type

Some of these properties can have arbitrary text values, others accept values from a predefined set. In the latter case set the desired value using the embedded combo box.

You can also set all the options directly in the SQL Editor, using the standard **CREATE PROCEDURE** or **CREATE FUNCTION** statement. However, it is recommended to use the Properties window instead.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**.

Figure 22.17. Stored Procedure SQL Saved

22.2.3.5. Editing Triggers

To create a new trigger, right-click the node of the table, for which you wish to add a trigger. From the node's context menu, choose the **CREATE TRIGGER** command. This command opens the SQL Editor.

To modify an existing trigger, double-click the node of the trigger you wish to modify, or right-click this node and choose the **ALTER TRIGGER** command from the context menu. Either of the commands opens the SQL Editor.

To create or alter the trigger definition using SQL Editor, type the trigger statement in the SQL Editor using standard SQL.

Note

You should enter only the trigger statement, that is, the part of the **CREATE TRIGGER** query that is placed after the **FOR EACH ROW** clause.

All other trigger properties are set in the Properties window. These properties are:

- Definer
- Event Manipulation
- Name
- Timing

Some of these properties can have arbitrary text values, others accept values from a predefined set. In the latter case set the desired value using the embedded combo box.

The properties **Event**, **Table**, **Schema**, and **Server** in the Properties window are read only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, you will be asked to confirm the execution of the corresponding SQL query in a confirmation dialog.

22.2.3.6. Editing User Defined Functions (UDF)

To create a new User Defined Function (UDF), right-click the **UDFs** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE UDF** command. This command opens the UDF Editor.

To modify an UDF, double-click the node of the UDF you wish to modify, or right-click this node and choose the **ALTER UDF** command from the context menu. Either of the commands opens the UDF Editor.

The UDF editor enables you to set the following properties:

- Name
- So-name (DLL name)
- Return type

- Is Aggregate

There are text fields for both names, a combo box for the return type, and a check box to indicate if the UDF is aggregate. All these options are also accessible using the Properties window.

The property **Server** in the Properties window is read only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, you will be asked to confirm the execution of the corresponding SQL query in a confirmation dialog.

22.2.3.7. Cloning Database Objects

Tables, views, stored procedures, and functions can be cloned using the appropriate Clone command from the context menu: **CLONE TABLE**, **CLONE VIEW**, **CLONE ROUTINE**. The clone commands open the corresponding editor for a new object: the **TABLE EDITOR** for cloning a table, and the **SQL EDITOR** for cloning a view or a routine.

The editor is filled with values of the original object. You can modify these values in a usual manner.

To save the cloned object, use either Save or Save All buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, you will be asked to confirm the execution of the corresponding SQL query in a confirmation dialog.

22.2.3.8. Dropping Database Objects

Tables, views, stored routines, triggers, and UDFs can be dropped with the appropriate Drop command selected from its context menu: **DROP TABLE**, **DROP VIEW**, **DROP ROUTINE**, **DROP TRIGGER**, **DROP UDF**.

You will be asked to confirm the execution of the corresponding drop query in a confirmation dialog.

Dropping of multiple objects is not supported.

22.2.3.9. Using the ADO.NET Entity Framework

Connector/.NET 6.0 introduced support for the ADO.NET Entity Framework. ADO.NET Entity Framework was included with .NET Framework 3.5 Service Pack 1, and Visual Studio 2008 Service Pack 1. ADO.NET Entity Framework was released on 11th August 2008.

ADO.NET Entity Framework provides an Object Relational Mapping (ORM) service, mapping the relational database schema to objects. The ADO.NET Entity Framework defines several layers, these can be summarized as:

- **Logical** - this layer defines the relational data and is defined by the Store Schema Definition Language (SSDL).
- **Conceptual** - this layer defines the .NET classes and is defined by the Conceptual Schema Definition Language (CSDL)
- **Mapping** - this layer defines the mapping from .NET classes to relational tables and associations, and is defined by Mapping Specification Language (MSL).

Connector/.NET integrates with Visual Studio 2008 to provide a range of helpful tools to assist the developer.

A full treatment of ADO.NET Entity Framework is beyond the scope of this manual. You are encouraged to review the [Microsoft ADO.NET Entity Framework documentation](#).

Tutorials on getting started with ADO.NET Entity Framework are available. See [Section 22.2.4.5, “Tutorial: Using an Entity Framework Entity as a Windows Forms Data Source”](#) and [Section 22.2.4.6, “Tutorial: Databinding in ASP.NET using LINQ on Entities”](#).

22.2.3.10. MySQL Website Configuration Tool

MySQL Connector/.NET 6.1 introduced the MySQL Website Configuration Tool. This is a facility available in Visual Studio that enables you to configure the Membership, Role, Session State and Profile Provider, without having to resort to editing configuration files. You simply run the tool, set your configuration options, and the tool will modify your `web.config` file accordingly.

The MySQL Website Configuration Tool appears as a small icon on the Solution Explorer toolbar in Visual Studio, as shown by the following screenshot:

Figure 22.18. MySQL Website Configuration Tool

Clicking the Website Configuration Tool icon launches the wizard and displays the first screen:

Figure 22.19. MySQL Website Configuration Tool - Membership

This allows you to enable use of the MySQL Membership Provider. Simply click the checkbox to enable this. You can now enter the name of the application that you are creating the configuration for. You can also enter a description for the application.

You can then click the EDIT... button to launch the Connection String Editor:

Figure 22.20. MySQL Website Configuration Tool - Connection String Editor

Note that if you have already defined a connection string for the providers manually in `web.config`, or previously using the tool, this will be automatically loaded and displayed, and can then be modified in this dialog.

You can also ensure that the necessary schema are created automatically for you by selecting the Autogenerate Schema checkbox. These schema are used to store membership information. The database used to storage is the one specified in the connection string.

You can also ensure that exceptions generated by the application will be written to the event log by selecting the **WRITE EXCEPTIONS TO EVENT LOG** checkbox.

Clicking the **ADVANCED...** button launches a dialog that enables you to set Membership Options. These options dictate such variables as password length required when a user signs up, whether the password is encrypted and whether the user can reset their password or not.

Figure 22.21. MySQL Website Configuration Tool - Advanced Options

Once information has been set up as required for configuration of the Membership Provider the NEXT button can be clicked to display the Roles Provider screen:

Figure 22.22. MySQL Website Configuration Tool - Roles

Again the connection string can be edited, a description added and Autogenerate Schema can be enabled before clicking NEXT to go to the Profiles Provider screen:

Figure 22.23. MySQL Website Configuration Tool - Profiles

This screen displays similar options to the previous screens.

Click NEXT to proceed to the Session State configuration page:

Figure 22.24. MySQL Website Configuration Tool - Session State

Once you have set up the Session State Provider as required, click FINISH to exit the wizard.

At this point it is necessary to select the Authentication Type to From Internet. This can be done by launching the ASP.NET Configuration Tool, and selecting the Security tab. Click the Select authentication type link and ensure that the From the internet radio button is selected. You can now examine the database you created to store membership information. All the necessary tables will have been created for you:

Figure 22.25. MySQL Website Configuration Tool - Tables

```

mysql> show tables;
Empty set (0.01 sec)

mysql> show tables;
Empty set (0.00 sec)

mysql> show tables;
+-----+
| Tables_in_testwebconfig |
+-----+

| my_aspnet_membership    |
| my_aspnet_profiles      |
| my_aspnet_roles          |
| my_aspnet_schemaversion |
| my_aspnet_sessioncleanup |
| my_aspnet_sessions       |
| my_aspnet_users          |
| my_aspnet_usersinroles   |
+-----+
9 rows in set (0.01 sec)

mysql>

```

22.2.3.11. MySQL SQL Editor

MySQL Connector/NET 6.3.2 introduced a new MySQL SQL Editor. The easiest way to invoke the editor is by selecting the NEW, FILE menu item from the Visual Studio main menu. This displays the **NEW FILE** dialog:

Figure 22.26. MySQL SQL Editor - New File

From the **NEW FILE** dialog select the MySQL template, and then double-click the **MySQL SQL SCRIPT** document, or click the **OPEN** button.

The MySQL SQL Editor will be displayed. You can now enter SQL code as required, or connect to a MySQL server. Click the **CONNECT TO MySQL** button in the MySQL SQL Editor toolbar. You can enter the connection details into the **CONNECT TO MySQL** dialog that is displayed. You can enter the server name, user id, password and database to connect to, or click the **ADVANCED** button to select other connection string options. Click the **CONNECT** button to connect to the MySQL server. It is now possible to execute your SQL code against the server by clicking the **RUN SQL** button on the toolbar.

Figure 22.27. MySQL SQL Editor - Query

The results from any queries are displayed on the **RESULTS** tab. Any errors are displayed on the **MESSAGES** tab.

22.2.3.12. DDL T4 Template Macro

MySQL Connector/.NET 6.3 introduced the ability to convert an Entity Framework model to MySQL DDL code. Starting with a blank model, an entity model can be developed in Visual Studio's designer. Once the model has been created, the model's properties can be selected, and in the Database Script Generation category of the model's properties, the property **DDL GENERATION** can be found. The value **SSDLToMySQL.tt(VS)** can then be selected from the drop-down listbox.

Figure 22.28. DDL T4 Template Macro - Model Properties

Right-clicking the model design area will display a context-sensitive menu. Selecting **GENERATE DATABASE FROM MODEL** from the menu will display the **GENERATE DATABASE WIZARD**. The wizard can then be used to generate MySQL DDL code.

Figure 22.29. DDL T4 Template Macro - Generate Database Wizard

22.2.4. Connector/NET Tutorials

22.2.4.1. Tutorial: An Introduction to Connector/NET Programming

This section provides a gentle introduction to programming with Connector/NET. The example code is written in C#, and is designed to work on both Microsoft .NET Framework and Mono.

This tutorial is designed to get you up and running with Connector/NET as quickly as possible, it does not go into detail on any particular topic. However, the following sections of this manual describe each of the topics introduced in this tutorial in more detail. In this tutorial you are encouraged to type in and run the code, modifying it as required for your setup.

This tutorial assumes you have MySQL and Connector/NET already installed. It also assumes that you have installed the World example database, which can be downloaded from the [MySQL Documentation page](#). You can also find details on how to install the database on the same page.

Note

Before compiling the example code make sure that you have added References to your project as required. The References required are `System`, `System.Data` and `MySql.Data`.

22.2.4.1.1. The MySqlConnection Object

For your Connector/NET application to connect to a MySQL database it needs to establish a connection. This is achieved through

the use of a `MySqlConnection` object.

The `MySqlConnection` constructor takes a connection string as one of its parameters. The connection string provides necessary information to make the connection to the MySQL database. The connection string is discussed more fully in [Section 22.2.5.1, “Connecting to MySQL Using Connector/NET”](#). A reference containing a list of supported connection string options can also be found in [Section 22.2.6, “Connector/NET Connection String Options Reference”](#).

The following code shows how to create a connection object.

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial1
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();
            // Perform database operations
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }
        conn.Close();
        Console.WriteLine("Done.");
    }
}
```

When the `MySqlConnection` constructor is invoked it returns a connection object, which is used for subsequent database operations. The first operation in this example is to open the connection. This needs to be done before further operations take place. Before the application exits the connection to the database needs to be closed by calling `Close` on the connection object.

Sometimes an attempt to perform an `Open` on a connection object can fail, this will generate an exception that can be handled using standard exception handling code.

In this section you have learned how to create a connection to a MySQL database, and open and close the corresponding connection object.

22.2.4.1.2. The `MySqlCommand` Object

Once a connection has been established with the MySQL database, the next step is to carry out the desired database operations. This can be achieved through the use of the `MySqlCommand` object.

You will see how to create a `MySqlCommand` object. Once it has been created there are three main methods of interest that you can call:

- **ExecuteReader** - used to query the database. Results are usually returned in a `MySqlDataReader` object, created by `ExecuteReader`.
- **ExecuteNonQuery** - used to insert and delete data.
- **ExecuteScalar** - used to return a single value.

Once a `MySqlCommand` object has been created, you will call one of the above methods on it to carry out a database operation, such as perform a query. The results are usually returned into a `MySqlDataReader` object, and then processed, for example the results might be displayed. The following code demonstrates how this could be done.

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial2
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
```

```

Console.WriteLine("Connecting to MySQL...");
conn.Open();

string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent='Oceania'";
MySqlCommand cmd = new MySqlCommand(sql, conn);
MySqlDataReader rdr = cmd.ExecuteReader();

while (rdr.Read())
{
    Console.WriteLine(rdr[0] + " -- " + rdr[1]);
}
rdr.Close();
}
catch (Exception ex)
{
    Console.WriteLine(ex.ToString());
}

conn.Close();
Console.WriteLine("Done.");
}
}

```

When a connection has been created and opened, the code then creates a `MySqlCommand` object. Note that the SQL query to be executed is passed to the `MySqlCommand` constructor. The `ExecuteReader` method is then used to generate a `MySqlReader` object. The `MySqlReader` object contains the results generated by the SQL executed on the command object. Once the results have been obtained in a `MySqlReader` object, the results can be processed. In this case the information is simply printed out as part of a `while` loop. Finally, the `MySqlReader` object is disposed of by running its `Close` method on it.

In the next example you will see how to use the `ExecuteNonQuery` method.

The procedure for performing an `ExecuteNonQuery` method call is simpler, as there is no need to create an object to store results. This is because `ExecuteNonQuery` is only used for inserting, updating and deleting data. The following example illustrates a simple update to the `Country` table:

```

using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial3
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****;";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();

            string sql = "INSERT INTO Country (Name, HeadOfState, Continent) VALUES ('Disneyland','Mickey Mouse', 'North America')";
            MySqlCommand cmd = new MySqlCommand(sql, conn);
            cmd.ExecuteNonQuery();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }

        conn.Close();
        Console.WriteLine("Done.");
    }
}

```

The query is constructed, the command object created and the `ExecuteNonQuery` method called on the command object. You can access your MySQL database with the MySQL Client program and verify that the update was carried out correctly.

Finally, you will see how the `ExecuteScalar` method can be used to return a single value. Again, this is straightforward, as a `MySqlDataReader` object is not required to store results, a simple variable will do. The following code illustrates how to use `ExecuteScalar`:

```

using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial4
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****;";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {

```

```

Console.WriteLine("Connecting to MySQL...");
conn.Open();

string sql = "SELECT COUNT(*) FROM Country";
MySqlCommand cmd = new MySqlCommand(sql, conn);
object result = cmd.ExecuteScalar();
if (result != null)
{
    int r = Convert.ToInt32(result);
    Console.WriteLine("Number of countries in the World database is: " + r);
}

}
catch (Exception ex)
{
    Console.WriteLine(ex.ToString());
}

conn.Close();
Console.WriteLine("Done.");
}
}

```

This example uses a simple query to count the rows in the Country table. The result is obtained by calling `ExecuteScalar` on the command object.

22.2.4.1.3. Working with Decoupled Data

Previously, when using `MySqlDataReader`, the connection to the database was continually maintained, unless explicitly closed. It is also possible to work in a manner where a connection is only established when needed. For example, in this mode, a connection could be established to read a chunk of data, the data could then be modified by the application as required. A connection could then be reestablished only if and when the application needs to write data back to the database. This decouples the working data set from the database.

This decouple mode of working with data is supported by Connector/.NET. There are several parts involved in allowing this method to work:

- **Data Set** - The Data Set is the area in which data is loaded to read or modify it. A `DataSet` object is instantiated, which can store multiple tables of data.
- **Data Adapter** - The Data Adapter is the interface between the Data Set and the database itself. The Data Adapter is responsible for efficiently managing connections to the database, opening and closing them as required. The Data Adapter is created by instantiating an object of the `MySqlDataAdapter` class. The `MySqlDataAdapter` object has two main methods: `Fill` which reads data into the Data Set, and `Update`, which writes data from the Data Set to the database.
- **Command Builder** - The Command Builder is a support object. The Command Builder works in conjunction with the Data Adapter. When a `MySqlDataAdapter` object is created it is typically given an initial SELECT statement. From this SELECT statement the Command Builder can work out the corresponding INSERT, UPDATE and DELETE statements that would be required should the database need to be updated. To create the Command Builder an object of the class `MySqlCommandBuilder` is created.

Each of these classes will now be discussed in more detail.

Instantiating a DataSet object

A `DataSet` object can be created simply, as shown in the following example code snippet:

```

DataSet dsCountry;
...
dsCountry = new DataSet();

```

Although this creates the `DataSet` object it has not yet filled it with data. For that a Data Adapter is required.

Instantiating a MySqlDataAdapter object

The `MySqlDataAdapter` can be created as illustrated by the following example:

```

MySqlDataAdapter daCountry;
...
string sql = "SELECT Code, Name, HeadOfState FROM Country WHERE Continent='North America'";
daCountry = new MySqlDataAdapter (sql, conn);

```

Note, the `MySqlDataAdapter` is given the SQL specifying the data you wish to work with.

Instantiating a MySqlCommandBuilder object

Once the `MySqlDataAdapter` has been created, it is necessary to generate the additional statements required for inserting, updating and deleting data. There are several ways to do this, but in this tutorial you will see how this can most easily be done with `MySqlCommandBuilder`. The following code snippet illustrates how this is done:

```
MySqlCommandBuilder cb = new MySqlCommandBuilder(daCountry);
```

Note that the `MySqlDataAdapter` object is passed as a parameter to the command builder.

Filling the Data Set

To do anything useful with the data from your database, you need to load it into a Data Set. This is one of the jobs of the `MySqlDataAdapter` object, and is carried out with its `Fill` method. The following example code illustrates this:

```
DataSet dsCountry;
...
dsCountry = new DataSet();
...
daCountry.Fill(dsCountry, "Country");
```

Note the `Fill` method is a `MySqlDataAdapter` method, the Data Adapter knows how to establish a connection with the database and retrieve the required data, and then populates the Data Set when the `Fill` method is called. The second parameter “Country” is the table in the Data Set to update.

Updating the Data Set

The data in the Data Set can now be manipulated by the application as required. At some point, changes to data will need to be written back to the database. This is achieved through a `MySqlDataAdapter` method, the `Update` method.

```
daCountry.Update(dsCountry, "Country");
```

Again, the Data Set and the table within the Data Set to update are specified.

Working Example

The interactions between the `DataSet`, `MySqlDataAdapter` and `MySqlCommandBuilder` classes can be a little confusing, so their operation can perhaps be best illustrated by working code.

In this example, data from the World database is read into a Data Grid View control. Here, the data can be viewed and changed before clicking an update button. The update button then activates code to write changes back to the database. The code uses the principles explained above. The application was built using the Microsoft Visual Studio to place and create the user interface controls, but the main code that uses the key classes described above is shown below, and is portable.

```
using System;
using System.Collections.Generic;
using System.ComponentModel;
using System.Data;
using System.Drawing;
using System.Linq;
using System.Text;
using System.Windows.Forms;

using MySql.Data;
using MySql.Data.MySqlClient;

namespace WindowsFormsApplication5
{
    public partial class Form1 : Form
    {
        MySqlCommandAdapter daCountry;
        DataSet dsCountry;

        public Form1()
        {
            InitializeComponent();
        }

        private void Form1_Load(object sender, EventArgs e)
        {
            string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
            MySqlConnection conn = new MySqlConnection(connStr);
            try
            {
                label2.Text = "Connecting to MySQL...";

                string sql = "SELECT Code, Name, HeadOfState FROM Country WHERE Continent='North America'";
                daCountry = new MySqlDataAdapter(sql, conn);
                MySqlCommandBuilder cb = new MySqlCommandBuilder(daCountry);
```

```

        dsCountry = new DataSet();
        daCountry.Fill(dsCountry, "Country");
        dataGridView1.DataSource = dsCountry;
        dataGridView1.DataMember = "Country";
    }
    catch (Exception ex)
    {
        label2.Text = ex.ToString();
    }
}

private void button1_Click(object sender, EventArgs e)
{
    daCountry.Update(dsCountry, "Country");
    label2.Text = "MySQL Database Updated!";
}
}
}

```

The application running is shown below:

Figure 22.30. World Database Application

22.2.4.1.4. Working with Parameters

This part of the tutorial shows you how to use parameters in your Connector/.NET application.

Although it is possible to build SQL query strings directly from user input, this is not advisable as it does not prevent erroneous or

malicious information being entered. It is safer to use parameters as they will be processed as field data only. For example, imagine the following query was contructed from user input:

```
string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent = "+user_continent;
```

If the string `user_continent` came from a Text Box control, there would potentially be no control over the string entered by the user. The user could enter a string that generates a run time error, or in the worst case actually harms the system. When using parameters it is not possible to do this because a parameter is only ever treated as a field parameter, rather than an arbitrary piece of SQL code.

The same query written user a parameter for user input would be:

```
string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent = @Continent";
```

Note that the parameter is preceded by an '@' symbol to indicate it is to be treated as a parameter.

As well as marking the position of the parameter in the query string, it is necessary to add a parameter to the Command object. This is illustrated by the following code snippet:

```
cmd.Parameters.AddWithValue("@Continent", "North America");
```

In this example the string "North America" is supplied as the parameter value statically, but in a more practical example it would come from a user input control.

A further example illustrates the complete process:

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorials5
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****;";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();

            string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent=@Continent";
            MySqlCommand cmd = new MySqlCommand(sql, conn);

            Console.WriteLine("Enter a continent e.g. 'North America', 'Europe': ");
            string user_input = Console.ReadLine();

            cmd.Parameters.AddWithValue("@Continent", user_input);

            MySqlDataReader rdr = cmd.ExecuteReader();

            while (rdr.Read())
            {
                Console.WriteLine(rdr["Name"] + " --- " + rdr["HeadOfState"]);
            }
            rdr.Close();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }

        conn.Close();
        Console.WriteLine("Done.");
    }
}
```

In this part of the tutorial you have see how to use parameters to make your code more secure.

22.2.4.1.5. Working with Stored Procedures

In this section you will see how to work with Stored Procedures. This section assumes you have a basic understanding of what a Stored Procedure is, and how to create one.

For the purposes of this tutorial, you will create a simple Stored Procedure to see how it can be called from Connector/.NET. In the MySQL Client program, connect to the World database and enter the following Stored Procedure:

```
DELIMITER //
CREATE PROCEDURE country_hos
```

```
(IN con CHAR(20))
BEGIN
    SELECT Name, HeadOfState FROM Country
    WHERE Continent = con;
END //
DELIMITER ;
```

Test the Stored Procedure works as expected by typing the following into the MySQL Client program:

```
CALL country_hos('Europe');
```

Note that The Stored Routine takes a single parameter, which is the continent you wish to restrict your search to.

Having confirmed that the Stored Procedure is present and correct you can now move on to seeing how it can be accessed from Connector/.NET.

Calling a Stored Procedure from your Connector/.NET application is similar to techniques you have seen earlier in this tutorial. A `MySqlCommand` object is created, but rather than taking a SQL query as a parameter it takes the name of the Stored Procedure to call. The `MySqlCommand` object also needs to be set to the type of Stored Procedure. This is illustrated by the following code snippet:

```
string rtn = "country_hos";
MySqlCommand cmd = new MySqlCommand(rtn, conn);
cmd.CommandType = CommandType.StoredProcedure;
```

In this case you also need to pass a parameter to the Stored Procedure. This can be achieved using the techniques seen in the previous section on parameters, [Section 22.2.4.1.4, “Working with Parameters”](#). This is shown in the following code snippet:

```
cmd.Parameters.AddWithValue("@con", "Europe");
```

The value of the parameter `@con` could more realistically have come from a user input control, but for simplicity it is set as a static string in this example.

At this point everything is set up and all that now needs to be done is to call the routine. This can be achieved using techniques also learned in earlier sections, but in this case the `ExecuteReader` method of the `MySqlCommand` object is used.

Complete working code for the Stored Procedure example is shown below:

```
using System;
using System.Data;

using MySql.Data;
using MySql.Data.MySqlClient;

public class Tutorial6
{
    public static void Main()
    {
        string connStr = "server=localhost;user=root;database=world;port=3306;password=*****;";
        MySqlConnection conn = new MySqlConnection(connStr);
        try
        {
            Console.WriteLine("Connecting to MySQL...");
            conn.Open();

            string rtn = "country_hos";
            MySqlCommand cmd = new MySqlCommand(rtn, conn);
            cmd.CommandType = CommandType.StoredProcedure;

            cmd.Parameters.AddWithValue("@con", "Europe");

            MySqlDataReader rdr = cmd.ExecuteReader();
            while (rdr.Read())
            {
                Console.WriteLine(rdr[0] + " --- " + rdr[1]);
            }
            rdr.Close();
        }
        catch (Exception ex)
        {
            Console.WriteLine(ex.ToString());
        }

        conn.Close();
        Console.WriteLine("Done.");
    }
}
```

In this section you have seen how to call a Stored Procedure from Connector/.NET. For the moment, this concludes our introductory tutorial on programming with Connector/.NET.

22.2.4.2. Tutorial: MySQL Connector/.NET ASP.NET Membership and Role Provider

Many web sites feature the facility for the user to create a user account. They can then log into the web site and enjoy a personalized experience. This requires that the developer creates database tables to store user information, along with code to gather and process this data. This represents a burden on the developer, and there is the possibility for security issues to creep into the developed code. However, ASP.NET 2.0 introduced the Membership system. This system is designed around the concept of Membership, Profile and Role Providers, which together provide all of the functionality to implement a user system, that previously would have to have been created by the developer from scratch.

Currently, MySQL Connector/.NET provides Membership, Role, Profile and Session State Providers.

This tutorial shows you how to set up your ASP.NET web application to use the MySQL Connector/.NET Membership and Role Providers. It assumes that you have MySQL Server installed, along with MySQL Connector/.NET and Microsoft Visual Studio. This tutorial was tested with MySQL Connector/.NET 6.0.4 and Microsoft Visual Studio 2008 Professional Edition. It is recommended you use 6.0.4 or above for this tutorial.

1. Create a new database in the MySQL Server using the MySQL Command Line Client program ([mysql](#)), or other suitable tool. It does not matter what name is used for the database, but it should be noted down so that it can be specified in the connection string constructed later in this tutorial. This database will contain the tables, automatically created for you later, used to store data about users and roles.
2. Create a new ASP.NET Web Site in Visual Studio. If you are not sure how to do this, refer to the following tutorial: [Section 22.2.4.6, “Tutorial: Databinding in ASP.NET using LINQ on Entities”](#), which demonstrates how to create a simple ASP.NET web site.
3. Add References to [MySql.Data](#) and [MySql.Web](#) to the web site project.
4. Locate the [machine.config](#) file on your system, which is the configuration file for the .NET Framework.
5. Search the [machine.config](#) file to find the membership provider [MySQLMembershipProvider](#).
6. Add the attribute [autogenerateschema="true"](#). The appropriate section should now resemble the following (note: for the sake of brevity some information has been excluded):

```
<membership>
  <providers>
    <add name="AspNetSqlMembershipProvider"
      type="System.Web.Security.SqlMembershipProvider"
      ...
      connectionStringName="LocalSqlServer"
      ... />
    <add name="MySQLMembershipProvider"
      autogenerateschema="true"
      type="MySql.Web.Security.MySQLMembershipProvider, MySql.Web, Version=6.0.4.0, Culture=neutral, PublicKeyToken"
      connectionStringName="LocalMySqlServer"
      ... />
  </providers>
</membership>
```

Note that the name for the connection string to be used to connect to the server that contains the membership database is [LocalMySqlServer](#).

The [autogenerateschema="true"](#) attribute will cause MySQL Connector/.NET to silently create, or upgrade, the schema on the database server, to contain the required tables for storing membership information.

7. It is now necessary to create the connection string referenced in the previous step. Load the web site's [web.config](#) file into Visual Studio.
8. Locate the section marked [<connectionStrings>](#). Add the following connection string information:

```
<connectionStrings>
  <remove name="LocalMySqlServer" />
  <add name="LocalMySqlServer"
    connectionString="Datasource=localhost;Database=users;uid=root;pwd=password;"
    providerName="MySql.Data.MySqlClient" />
</connectionStrings>
```

The database specified is the one created in the first step. You could alternatively have used an existing database.

9. At this point build the solution to ensure no errors are present. This can be done by selecting [BUILD](#), [BUILD SOLUTION](#) from the main menu, or pressing [F6](#).
10. ASP.NET supports the concept of locally and remotely authenticated users. With local authentication the user is validated using their Windows credentials when they attempt to access the web site. This can be useful in an Intranet environment. With

remote authentication a user is prompted for their login details when accessing the web site, and these credentials are checked against the membership information stored in a database server such as MySQL Server. You will now see how to choose this form of authentication.

Start the ASP.NET Web Site Administration Tool. This can be done quickly by clicking the small hammer/Earth icon in the Solution Explorer. You can also launch this tool by selecting WEBSITE, ASP.NET CONFIGURATION from the main menu.

11. In the ASP.NET Web Site Administration Tool click the **SECURITY** tab.
12. Now click the **USER AUTHENTICATION TYPE** link.
13. Select the **FROM THE INTERNET** radio button. The web site will now need to provide a form to allow the user to enter their login details. These will be checked against membership information stored in the MySQL database.

Figure 22.31. Authentication Type

14. You now need to specify the Role and Membership Provider to be used. Click the **PROVIDER** tab.
15. Click the **SELECT A DIFFERENT PROVIDER FOR EACH FEATURE (ADVANCED)** link.
16. Now select the **MySQLMembershipProvider** and the **MySQLRoleProvider** radio buttons.

Figure 22.32. Select Membership and Role Provider

17. In Visual Studio rebuild the solution by selecting BUILD, REBUILD SOLUTION from the main menu.
18. Check that the necessary schema has been created. This can be achieved using the MySQL Command Line Client program.

Figure 22.33. Membership and Role Provider Tables

The screenshot shows the MySQL Command Line Client window. The title bar reads "MySQL Command Line Client". The main area displays two sets of command-line output:

```
| Database      |
+-----+
| information_schema |
| mysql          |
| test           |
| users          |
| world          |
+-----+
5 rows in set <0.01 sec>

mysql> show tables;
+-----+
| Tables_in_users |
+-----+
| my_aspnet_applications |
| my_aspnet_membership   |
| my_aspnet_profiles     |
| my_aspnet_roles         |
| my_aspnet_schemaversion |
| my_aspnet_users         |
| my_aspnet_usersinroles |
+-----+
7 rows in set <0.00 sec>

mysql>
```

19. Assuming all is present and correct you can now create users and roles for your web application. The easiest way to do this is with the ASP.NET Web Site Administration Tool. However, many web applications contain their own modules for creating roles and users. For simplicity the ASP.NET Web Site Administration Tool will be used in this tutorial.
20. In the ASP.NET Web Site Administration Tool, click the **SECURITY** tab. Now that both the Membership and Role Provider are enabled you will see links for creating roles and users. Click the **CREATE OR MANAGE ROLES** link.

Figure 22.34. Security Tab

The screenshot shows the ASP.NET Web Site Administration Tool interface. The title bar reads "ASP.net Microsoft Web Site Administration Tool". Below it is a navigation bar with four tabs: "Home", "Security" (which is selected and highlighted in blue), "Application", and "Provider". The main content area has the following text:

You can use the Web Site Administration Tool to manage all the security settings for your application. You can set up users and passwords (authentication), create roles (groups of users), and create permissions (rules for controlling access to parts of your application).

By default, user information is stored in a Microsoft SQL Server Express database in the Data folder of your Web site. If you want to store user information in a different database, use the Provider tab to select a different provider.

[Use the security Setup Wizard to configure security step by step.](#)

Click the links in the table to manage the settings for your application.

Users	Roles	Access Rules
Existing users: 1 Create user Manage users Select authentication type	Existing roles: 2 Disable Roles Create or Manage roles	Create access rules Manage access rules

21. You can now enter the name of a new Role and click ADD ROLE to create the new Role. Create new Roles as required.
22. Click the BACK button.
23. Click the **CREATE USER** link. You can now fill in information about the user to be created, and also allocate that user to one or more Roles.

Figure 22.35. Create User

Add a user by entering the user's ID, password, and e-mail address on this page.

Create User		Roles
Sign Up for Your New Account User Name: <input type="text" value="johndoe"/> Password: <input type="password" value="password"/> Confirm Password: <input type="password" value="password"/> E-mail: <input type="text" value="johndoe@example.com"/> Security Question: <input type="text" value="Statler and ..."/> Security Answer: <input type="text" value="Waldorf"/>		Select roles for this user: <input type="checkbox"/> Visitors <input checked="" type="checkbox"/> Admins
<input type="button" value="Create User"/>		
<input checked="" type="checkbox"/> Active User		

24. Using the MySQL Command Line Client program you can check that your database has been correctly populated with the Membership and Role data.

Figure 22.36. Membership and Roles Table Contents

```

MySQL Command Line Client
my_aspnet_roles
my_aspnet_schemaversion
my_aspnet_users
my_aspnet_usersinroles
7 rows in set <0.00 sec>

mysql> select * from my_aspnet_users;
+----+-----+-----+-----+-----+
| id | applicationId | name | isAnonymous | lastActivityDate |
+----+-----+-----+-----+-----+
| 1 | 1 | johndoe | 0 | 2009-07-14 17:17:25 |
+----+-----+-----+-----+-----+
1 row in set <0.01 sec>

mysql> select * from my_aspnet_roles;
+----+-----+-----+
| id | applicationId | name |
+----+-----+-----+
| 1 | 1 | Visitors |
| 2 | 1 | Admins |
+----+-----+-----+
2 rows in set <0.00 sec>

mysql> .

```

In this tutorial you have seen how to set up the MySQL Connector/.NET Membership and Role Providers for use in your ASP.NET web application.

22.2.4.3. Tutorial: MySQL Connector/.NET ASP.NET Session State Provider

MySQL Connector/.NET from version 6.1 has included a MySQL Session State Provider. This provider enables you to store session state in a MySQL database. The following tutorial shows you how to prepare to use the MySQL Session State Provider, and then store session data into the MySQL database. This tutorial uses Microsoft Visual Studio 2008 Professional Edition, MySQL Connector/.NET 6.1.1 and MySQL Server 5.1. This tutorial also assumes you have created an empty database, for example `test`, where you will store session data. You could do this using the MySQL Command Line Client tool.

1. In Visual Studio create a new ASP.NET web site. If you are not sure how to do this refer to the tutorial [Section 22.2.4.6, “Tutorial: Databinding in ASP.NET using LINQ on Entities”](#) which demonstrates how to do this.
2. Launch the MySQL MySQL Website Configuration tool. Due to a bug in 6.1.1 this may not appear unless you are connected to a server in the Server Explorer. If you are unfamiliar with the MySQL Website Configuration tool it is suggested that you first work through the following tutorial [Section 22.2.3.10, “MySQL Website Configuration Tool”](#).
3. Navigate through the wizard to the Session State page. Make sure the checkbox **USE MYSQL TO MANAGE MY ASP.NET SESSION DATA** is selected.
4. On the same page configure the connection string to the database that will contain your session data. This database can be empty as MySQL Connector/.NET will create the schema required to store session data.
5. Ensure that the checkbox **AUTOGGENERATE SCHEMA** is selected so that MySQL Connector/.NET will create the schema in your database to store the session data correctly.
6. Enter the name of your application.
7. Click FINISH. The MySQL Website Configuration tool will now update your application's `web.config` file with information about the connection string and default providers to be used. In this case we have selected the MySQL Session State Provider.

At this point you are ready to use the MySQL database to store session data. To test that the set up has worked you can write a simple program that uses session variables.

1. Open `Default.aspx.cs`. In the `Page_Load` method add the following code:

```
Session["SessionVariable1"] = "Test string";
```

2. Build your solution.
3. Run the solution (without debugging). When the application runs, the provider will autogenerate tables required in the database you chose when setting up the application.
4. Check that the schema was in fact created. Using the MySQL Command Line Client use the target database and then type `SHOW TABLES;`. You will see that MySQL Connector/.NET has created the required schema automatically, as we selected this to happen in the MySQL Website Configuration tool.
5. Now view the contents of these tables by typing `SELECT * FROM my_aspnet_sessions;` in the MySQL Command Line Client. This will display the session data our application used. Note that this is stored in binary format so some data may not display as expected.

At this point you have installed the Session State Provider and carried out a preliminary test of the installation. You will now work a bit more with the Session State Provider.

In this part of the tutorial you will set and retrieve a session variable. You can work with your existing project.

1. Select the `Default.aspx` and switch to Design View. Add a text box and three buttons. Change the text property for the buttons to “Store Session Variable”, “Clear Textbox”, and “Show Session Variable”. These will be `Button1`, `Button2` and `Button3` respectively. Build your solution to ensure that no errors have been introduced.
2. Still in the Design View, double-click `Button1`. Now to the `Button1_Click` event handler add code some the handler resembles the following:

```
protected void Button1_Click(object sender, EventArgs e)
{
    Session["SessionString"] = TextBox1.Text;
}
```

You have created a new Session variable accessed using the key “SessionString”. This will be set to the text that was entered into the text box when **Button1** is clicked.

3. In Design View double-click **Button2** to add its click event handler. This button needs to clear text from the text box. The code to do this is as follows:

```
protected void Button2_Click(object sender, EventArgs e)
{
    TextBox1.Text = "";
}
```

The code simply assigns an empty string to the **Text** property of the text box.

4. In the Design View double-click **Button3** and modify the click handler as follows:

```
protected void Button3_Click(object sender, EventArgs e)
{
    TextBox1.Text = (String)Session["SessionString"];
}
```

This will retrieve the session string and display it in the text box.

5. Now modify the **Page_Load** method as follows:

```
protected void Page_Load(object sender, EventArgs e)
{
    if (!IsPostBack)
    {
        TextBox1.Text = "Enter some text";
    }
}
```

This ensures that when the page loads the text box **Text** property is reset.

6. Ensure that the solution is saved and then rebuild the solution.
7. Run the solution without debugging.
8. The form will be displayed. Enter some text into the text box. Now click STORE SESSION VARIABLE. At this point you have stored the string in a session variable.
9. Now click CLEAR TEXT to clear the text box.
10. Now click SHOW SESSION VARIABLE to retrieve and display the session variable.
11. Refresh the page to destroy the form and display a new form.
12. Click SHOW SESSION VARIABLE the text box will display the stored session variable, demonstrating that the refreshing the page does not destroy the session variable.

This illustrates that the session state data is not destroyed when a page is reloaded.

22.2.4.4. Tutorial: MySQL Connector/NET ASP.NET Profile Provider

This tutorial shows you how to use the MySQL Profile Provider to store user profile information in a MySQL database. The tutorial uses MySQL Connector/NET 6.1.1, MySQL Server 5.1 and Microsoft Visual Studio 2008 Professional Edition.

Many modern web sites allow the user to create a personal profile. This requires a significant amount of code, but ASP.NET reduces this considerable by including the functionality in its Profile classes. The Profile Provider provides an abstraction between these classes and a data source. The MySQL Profile Provider enables profile data to be stored in a MySQL database. This enables the profile properties to be written to a persistent store, and be retrieved when required. The Profile Provider also enables profile data to be managed effectively, for example it enables profiles that have not been accessed since a specific date to be deleted.

The following steps show you how you can select the MySQL Profile Provider.

1. Create a new ASP.NET web project.
2. Select the MySQL Website Configuration tool. Due to a bug in 6.1.1 you may have to first connect to a server in Server Explorer before the tool's icon will display in the toolbar of the Solution Explorer.

3. In the MySQL Website Configuration tool navigate through the tool to the Profiles page.
4. Select the **USE MYSQL TO MANAGE MY PROFILES** checkbox.
5. Select the **AUTOGENERATE SCHEMA** checkbox.
6. Click the **EDIT...** button and configure a connection string for the database that will be used to store user profile information.
7. Navigate to the last page of the tool and click **FINISH** to save your changes and exit the tool.

At this point you are now ready to start using the MySQL Profile Provider. With the following steps you can carry out a preliminary test of your installation.

1. Open your **web.config** file.
2. Add a simple profile such as the following:

```
<system.web>
  <anonymousIdentification enabled="true"/>
  <profile defaultProvider="MySQLProfileProvider">
    ...
    <properties>
      <add name="Name" allowAnonymous="true"/>
      <add name="Age" allowAnonymous="true" type="System.UInt16"/>
      <group name="UI">
        <add name="Color" allowAnonymous="true" defaultValue="Blue"/>
        <add name="Style" allowAnonymous="true" defaultValue="Plain"/>
      </group>
    </properties>
  </profile>
  ...

```

Note that **anonymousIdentification** has been set to true. This enables users who have not been authenticated to use profiles. They are identified by a GUID in a cookie rather than by user name.

Now that the simple profile has been defined in **web.config**, the next step is to write some code to test the profile.

1. In Design View design a simple page with the following controls:

Figure 22.37. Simple Profile Application

These will allow the user to enter some profile information. The user can also use the buttons to save their profile, clear the page, and restore their profile data.

2. In the Code View add code as follows:

```
...
protected void Page_Load(object sender, EventArgs e)
{
    if (!IsPostBack)
    {
        TextBox1.Text = Profile.Name;
        TextBox2.Text = Profile.Age.ToString();
        Label1.Text = Profile.UI.Color;
    }
}

// Store Profile
protected void Button1_Click(object sender, EventArgs e)
{
    Profile.Name = TextBox1.Text;
    Profile.Age = UInt16.Parse(TextBox2.Text);
}

// Clear Form
protected void Button2_Click(object sender, EventArgs e)
{
    TextBox1.Text = "";
    TextBox2.Text = "";
    Label1.Text = "";
}

// Retrieve Profile
protected void Button3_Click(object sender, EventArgs e)
{
    TextBox1.Text = Profile.Name;
    TextBox2.Text = Profile.Age.ToString();
    Label1.Text = Profile.UI.Color;
}

protected void DropDownList1_SelectedIndexChanged(object sender, EventArgs e)
{
    Profile.UI.Color = DropDownList1.SelectedValue;
}
...
```

3. Save all files and build the solution to check that no errors have been introduced.
4. Run the application.
5. Enter your name, age and select a color from the listbox. Now store this information in your profile by clicking STORE PROFILE. Note that if you do not select a color from the listbox your profile will use the default color **Blue** that was specified in the **web.config** file.
6. Click CLEAR FORM to clear text from the textboxes and the label that displays your chosen color.
7. Now click RETRIEVE PROFILE to restore your profile data from the MySQL database.
8. Now exit the browser to terminate the application.
9. Run the application again. Note that when the page loads your profile information is restored from the MySQL database.

In this tutorial you have seen how to using the MySQL Profile Provider with MySQL Connector/.NET.

22.2.4.5. Tutorial: Using an Entity Framework Entity as a Windows Forms Data Source

In this tutorial you will learn how to create a Windows Forms Data Source from an Entity in an Entity Data Model. This tutorial assumes that you have installed the World example database, which can be downloaded from the [MySQL Documentation page](#). You can also find details on how to install the database on the same page. It will also be convenient for you to create a connection to the World database after it is installed. For instructions on how to do this see [Section 22.2.3.1, “Making a connection”](#).

Creating a new Windows Forms application

The first step is to create a new Windows Forms application.

1. In Visual Studio, select **FILE**, **NEW**, **PROJECT** from the main menu.
2. Choose the **WINDOWS FORMS APPLICATION** installed template. Click **OK**. The solution is created.

Adding an Entity Data Model

You will now add an Entity Data Model to your solution.

1. In the Solution Explorer, right-click your application and select **ADD, NEW ITEM...**. From **VISUAL STUDIO INSTALLED TEMPLATES** select **ADO.NET ENTITY DATA MODEL**. Click ADD.

Figure 22.38. Add Entity Data Model

2. You will now see the Entity Data Model Wizard. You will use the wizard to generate the Entity Data Model from the world example database. Select the icon **GENERATE FROM DATABASE**. Click **NEXT**.

Figure 22.39. Entity Data Model Wizard Screen 1

3. You can now select the connection you made earlier to the World database. If you have not already done so, you can create the new connection at this time by clicking NEW CONNECTION.... For further instructions on creating a connection to a database see [Section 22.2.3.1, "Making a connection"](#).

Figure 22.40. Entity Data Model Wizard Screen 2

4. Make a note of the entity connection settings to be used in App.Config, as these will be used later to write the necessary control code.
5. Click NEXT.
6. The Entity Data Model Wizard connects to the database. You are then presented with a tree structure of the database. From this you can select the object you would like to include in your model. If you had created Views and Stored Routines these will be displayed along with any tables. In this example you just need to select the tables. Click FINISH to create the model and exit the wizard.

Figure 22.41. Entity Data Model Wizard Screen 3

- Visual Studio will generate the model and then display it.

Figure 22.42. Entity Data Model Diagram

8. From the Visual Studio main menu select BUILD, BUILD SOLUTION, to ensure that everything compiles correctly so far.

Adding a new Data Source

You will now add a new Data Source to your project and see how it can be used to read and write to the database.

1. From the Visual Studio main menu select DATA, ADD NEW DATA SOURCE.... You will be presented with the Data Source Configuration Wizard.

Figure 22.43. Entity Data Source Configuration Wizard Screen 1

2. Select the **OBJECT** icon. Click **NEXT**.
3. You will now select the Object you wish to bind to. Expand the tree. In this tutorial you will select the city table. Once the city table has been selected click **NEXT**.

Figure 22.44. Entity Data Source Configuration Wizard Screen 2

4. The wizard will confirm that the city object is to be added. Click FINISH.

Figure 22.45. Entity Data Source Configuration Wizard Screen 3

5. The city object will be display in the Data Sources panel. If the Data Sources panel is not displayed, select DATA, SHOW DATA SOURCES from the Visual Studio main menu. The docked panel will then be displayed.

Figure 22.46. Data Sources

Using the Data Source in a Windows Form

You will now learn how to use the Data Source in a Windows Form.

1. In the Data Sources panel select the Data Source you just created and drag and drop it onto the Form Designer. By default the Data Source object will be added as a Data Grid View control. Note that the Data Grid View control is bound to the `cityBindingSource` and the Navigator control is bound to `cityBindingNavigator`.

Figure 22.47. Data Form Designer

2. Save and rebuild the solution before continuing.

Adding Code to Populate the Data Grid View

You are now ready to add code to ensure that the Data Grid View control will be populated with data from the City database table.

1. Double-click the form to access its code.
2. Add code to instantiate the Entity Data Model's EntityContainer object and retrieve data from the database to populate the control.

Figure 22.48. Adding Code to the Form

3. Save and rebuild the solution.
4. Run the solution. Ensure the grid is populated and you can navigate the database.

Figure 22.49. The Populated Grid Control

Adding Code to Save Changes to the Database

You will now add code to enable you to save changes to the database.

The Binding source component ensures that changes made in the Data Grid View control are also made to the Entity classes bound to it. However, that data needs to be saved back from the entities to the database itself. This can be achieved by the enabling of the Save button in the Navigator control, and the addition of some code.

1. In the Form Designer, click the Save icon in the Form toolbar and ensure that its Enabled property is set to True.

Figure 22.50. Save Button Enabled

2. Double-click the Save icon in the Form toolbar to display its code.
3. You now need to add code to ensure that data is saved to the database when the save button is clicked in the application.

Figure 22.51. Adding Save Code to the Form

```

Form1.cs Model1.edmx Form1.cs [Design] Start Page
WindowsFormsApplication4.Form1 Form1_Load(object sender, EventArgs e)
public Form1()
{
    InitializeComponent();
}

private void Form1_Load(object sender, EventArgs e)
{
    we = new worldEntities();
    cityBindingSource.DataSource = we.city;
}

private void cityBindingNavigatorSaveItem_Click(object sender, EventArgs e)
{
    we.SaveChanges();
}

```

- Once the code has been added, save the solution and rebuild it. Run the application and verify that changes made in the grid are saved.

22.2.4.6. Tutorial: Databinding in ASP.NET using LINQ on Entities

In this tutorial you create an ASP.NET web page that binds LINQ queries to entities using the Entity Framework mapping.

If you have not already done so, you should install the World example database prior to attempting this tutorial. Instructions on where to obtain the database and instructions on how to install it where given in the tutorial [Section 22.2.4.5, “Tutorial: Using an Entity Framework Entity as a Windows Forms Data Source”](#).

Creating an ASP.NET web site

In this part of the tutorial you will create an ASP.NET web site. The web site will use the World database. The main web page will feature a drop down list from which you can select a country, data about that country's cities will then be displayed in a grid view control.

- From the Visual Studio main menu select **FILE, NEW, WEB SITE...**
- From the Visual Studio installed templates select **ASP.NET WEB SITE**. Click OK. You will be presented with the Source view of your web page by default.
- Click the Design view tab situated underneath the Source view panel.

Figure 22.52. The Design Tab

4. In the Design view panel, enter some text to decorate the blank web page.
5. Click Toolbox. From the list of controls select **DROPODOWNLIST**. Drag and drop the control to a location beneath the text on your web page.

Figure 22.53. Drop Down List

6. From the **DROPODOWNLIST** control's context menu, ensure that the **ENABLE AUTOPOSTBACK** check box is enabled. This will ensure the control's event handler is called when an item is selected. The user's choice will in turn be used to populate the **GRIDVIEW** control.

Figure 22.54. Enable AutoPostBack

- From the Toolbox select the **GRIDVIEW** control.

Figure 22.55. Grid View Control

Drag and drop the Grid View control to a location just below the Drop Down List you already placed.

Figure 22.56. Placed Grid View Control

- At this point it is recommended that you save your solution, and build the solution to ensure that there are no errors.
- If you run the solution you will see that the text and drop down list are displayed, but the list is empty. Also, the grid view does not appear at all. Adding this functionality is described in the following sections.

At this stage you have a web site that will build, but further functionality is required. The next step will be to use the Entity Framework to create a mapping from the World database into entities that you can control programmatically.

Creating an ADO.NET Entity Data Model

In this stage of the tutorial you will add an ADO.NET Entity Data Model to your project, using the World database at the storage level. The procedure for doing this is described in the tutorial [Section 22.2.4.5, “Tutorial: Using an Entity Framework Entity as a Windows Forms Data Source”](#), and so will not be repeated here.

Populating a Drop Data List Box with using the results of a entity LINQ query

In this part of the tutorial you will write code to populate the DropDownList control. When the web page loads the data to populate the list will be achieved by using the results of a LINQ query on the model created previously.

1. In the Design view panel, double-click any blank area. This brings up the `Page_Load` method.
2. Modify the relevant section of code according to the following listing:

```
...
public partial class _Default : System.Web.UI.Page
{
    worldModel.worldEntities we;

    protected void Page_Load(object sender, EventArgs e)
    {
        we = new worldModel.worldEntities();

        if (!IsPostBack)
        {
            var countryQuery = from c in we.country
                               orderby c.Name
                               select new { c.Code, c.Name };
            DropDownList1.DataValueField = "Code";
            DropDownList1.DataTextField = "Name";
            DropDownList1.DataSource = countryQuery;
            DataBind();
        }
    }
...
}
```

Note that the list control only needs to be populated when the page first loads. The conditional code ensures that if the page is subsequently reloaded, the list control is not repopulated, which would cause the user selection to be lost.

3. Save the solution, build it and run it. You should see the list control has been populated. You can select an item, but as yet the grid view control does not appear.

At this point you have a working Drop Down List control, populated by a LINQ query on your entity data model.

Populating a Grid View control using an entity LINQ query

In the last part of this tutorial you will populate the Grid View Control using a LINQ query on your entity data model.

1. In the Design view, double-click the **DROPDOWNLIST** control. This causes its `SelectedIndexChanged` code to be displayed. This method is called when a user selects an item in the list control and thus fires an AutoPostBack event.
2. Modify the relevant section of code accordingly to the following listing:

```
...
protected void DropDownList1_SelectedIndexChanged(object sender, EventArgs e)
{
    var cityQuery = from c in we.city
                   where c.CountryCode == DropDownList1.SelectedValue
                   orderby c.Name
                   select new { c.Name, c.Population, c.CountryCode };
    GridView1.DataSource = cityQuery;
    DataBind();
}
...
```

The grid view control is populated from the result of the LINQ query on the entity data model.

3. As a check compare your code to that shown in the following screenshot:

Figure 22.57. Source Code

The screenshot shows the Visual Studio IDE with the code editor open for the file Default.aspx.cs. The tab bar at the top has three tabs: Default.aspx.cs, App_Code/Model.Designer.cs, and Default.aspx*. The Default.aspx.cs tab is active. The code in the editor is as follows:

```
protected void Page_Load(object sender, EventArgs e)
{
    we = new worldModel.worldEntities();

    if (!IsPostBack)
    {
        var countryQuery = from c in we.country
                           orderby c.Name
                           select new { c.Code, c.Name };
        DropDownList1.DataValueField = "Code";
        DropDownList1.DataTextField = "Name";
        DropDownList1.DataSource = countryQuery;
        DataBind();
    }
}

protected void DropDownList1_SelectedIndexChanged(object sender, EventArgs e)
{
    var cityQuery = from c in we.city
                   where c.CountryCode == DropDownList1.SelectedValue
                   orderby c.Name
                   select new { c.Name, c.Population, c.CountryCode };
    GridView1.DataSource = cityQuery;
    DataBind();
}
```

4. Save, build and run the solution. As you select a country you will see its cities are displayed in the grid view control.

Figure 22.58. The Working Web Site

The screenshot shows a Microsoft Internet Explorer browser window. The address bar displays the URL <http://localhost:1174/WebSite3/Default.aspx>. The main content area is titled "World Database Website". Below the title, there is a dropdown menu with the option "Belgium" selected. A table is displayed, showing data for Belgian cities. The table has columns: Name, Population, and CountryCode. The data is as follows:

Name	Population	CountryCode
Antwerpen	446525	BEL
Brugge	116246	BEL
Bruxelles [Brussel]	133859	BEL
Charleroi	200827	BEL
Gent	224180	BEL
Liège	185639	BEL
Mons	90935	BEL
Namur	105419	BEL
Schaerbeek	105692	BEL

In this tutorial you have seen how to create an ASP.NET web site, you have also seen how you can access a MySQL database using LINQ queries on an entity data model.

22.2.4.7. Tutorial: Using SSL with MySQL Connector/.NET

In this tutorial you will learn how you can use MySQL Connector/.NET to connect to a MySQL server configured to use SSL. Support for SSL client certificates was added with MySQL Connector/.NET 6.2.

MySQL Server uses the PEM format for certificates and private keys. This tutorial will use the test certificates from the server test suite by way of example. You can obtain the MySQL Server source code from [MySQL Downloads](#). The certificates can be found in the directory `./mysql-test/std_data`.

To carry out the steps in this tutorial you will also need to have Open SSL installed. This can be downloaded for Microsoft Windows at no charge from [Shining Light Productions](#).

Further details on the connection string options used in this tutorial can be found at [Section 22.2.6, “Connector/.NET Connection String Options Reference”](#).

Configuring the MySQL Server to use SSL

1. In the MySQL Server configuration file, set the SSL parameters as follows:

```
ssl-ca=path/to/repo/mysql-test/std_data/cacert.pem
ssl-cert=path/to/repo/mysql-test/std_data/server-cert.pem
ssl-key=path/to/repo/mysql-test/std_data/server-key.pem
```

Adjust the directories according to the location in which you installed the MySQL source code.

2. In this step you create a test user and set the user to require SSL.

Using the MySQL Command Line Client, connect as root and create the user `sslclient`.

3. To set privileges and requirements, issue the following command:

```
GRANT ALL PRIVILEGES ON *.* TO sslclient@'%' REQUIRE SSL;
```

Creating a certificate file to use with the .NET client

1. The .NET client does not use the PEM file format, as .NET does not support this format natively. You will be using test client certificates from the same server repository, for the purposes of this example. You will need to convert these to PFX format first. This format is also known as PKCS#12. An article describing this procedure can be found at the [Citrix website](#). From the directory `server-repository-root/mysql-test/std_data`, issue the following command:

```
openssl pkcs12 -export -in client-cert.pem -inkey client-key.pem -certfile cacert.pem -out client.pfx
```

2. When asked for an export password, enter the password “pass”. The file `client.pfx` will be generated. This file is used in the remainder of the tutorial.

Connecting to the server using a file-based certificate

1. You will use PFX file, `client.pfx` you created in the previous step to authenticate the client. The following example demonstrates how to connect using the `SSL Mode`, `CertificateFile` and `CertificatePassword` connection string options:

```
using (MySqlConnection connection = new MySqlConnection(  
    "database=test;user=sslclient;" +  
    "CertificateFile=H:\bzxr\mysql-trunk\mysqltest\std_data\client.pfx" +  
    "CertificatePassword=pass;" +  
    "SSL Mode=Required"))  
{  
    connection.Open();  
}
```

The path to the certificate file will need to be changed to reflect your individual installation.

Connecting to the server using a store-based certificate

1. The first step is to import the PFX file, `client.pfx`, into the Personal Store. Double-click the file in Windows explorer. This launches the Certificate Import Wizard.
2. Follow the steps dictated by the wizard, and when prompted for the password for the PFX file, enter “pass”.
3. Click FINISH to close the wizard and import the certificate into the personal store.

Examine certificates in the Personal Store

1. Start the Microsoft Management Console by entering `mmc.exe` at a command prompt.
2. Select FILE, ADD/REMOVE SNAP-IN. Click ADD. Select **CERTIFICATES** from the list of available snap-ins in the dialog.
3. Click ADD button in the dialog, and select the **MY USER ACCOUNT** radio button. This is used for personal certificates.
4. Click the FINISH button.
5. Click OK to close the Add/Remove Snap-in dialog.
6. You will now have **CERTIFICATES – CURRENT USER** displayed in the left panel of the Microsoft Management Console. Expand the Certificates - Current User tree item and select **PERSONAL, CERTIFICATES**. The right-hand panel will display a certificate issued to MySQL. This is the certificate that was previously imported. Double-click the certificate to display its details.

7. After you have imported the certificate to the Personal Store, you can use a more succinct connection string to connect to the database, as illustrated by the following code:

```
using (MySqlConnection connection = new MySqlConnection(
    "database=test;user=sslclient;" +
    "Certificate Store Location=CurrentUser;" +
    "SSL Mode=Required"))
{
    connection.Open();
}
```

Certificate Thumbprint Parameter

If you have a large number of certificates in your store, and many have the same Issuer, this can be a source of confusion and result in the wrong certificate being used. To alleviate this situation, there is an optional Certificate Thumbprint parameter that can additionally be specified as part of the connection string. As mentioned before, you can double-click a certificate in the Microsoft Management Console to display the certificate's details. When the Certificate dialog is displayed click the **DETAILS** tab and scroll down to see the thumbprint. The thumbprint will typically be a number such as `□47 94 36 00 9a 40 f3 01 7a 14 5c f8 47 9e 76 94 d7 aa de f0`. This thumbprint can be used in the connection string, as the following code illustrates:

```
using (MySqlConnection connection = new MySqlConnection(
    "database=test;user=sslclient;" +
    "Certificate Store Location=CurrentUser;" +
    "Certificate Thumbprint=479436009a40f3017a145cf8479e7694d7aadef0;" +
    "SSL Mode=Required"))
{
    connection.Open();
}
```

Spaces in the thumbprint parameter are optional and the value is case-insensitive.

22.2.4.8. Tutorial: Using MySqlScript

In this tutorial you will learn how to use the [MySqlScript](#) class. This class enables you to execute a series of statements. Depending on the circumstances, this can be more convenient than using the [MySqlCommand](#) approach.

Further details of the [MySqlScript](#) class can be found in the reference documentation supplied with MySQL Connector/.NET.

If you wish to run the example programs in this tutorial, you will need to set up a simple test database and table. This can be achieved using the MySQL Command Line Client or MySQL Workbench. Commands for the MySQL Command Line Client are given here:

1. `CREATE DATABASE TestDB;`
2. `USE TestDB;`
3. `CREATE TABLE TestTable (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, name VARCHAR(100));`

The main method of the [MySqlScript](#) class is the [Execute](#) method. This method causes the script (sequence of statements) assigned to the [Query](#) property of the [MySqlScript](#) object to be executed. Note the [Query](#) property can be set through the [MySqlScript](#) constructor or using the [Query](#) property. [Execute](#) returns the number of statements executed.

The [MySqlScript](#) object will execute the specified script on the connection set using the [Connection](#) property. Again, this property can be set directly or through the [MySqlScript](#) constructor. The following code snippets illustrate this:

```
string sql = "SELECT * FROM TestTable";
...
MySqlScript script = new MySqlScript(conn, sql);
...
MySqlScript script = new MySqlScript();
script.Query = sql;
script.Connection = conn;
...
script.Execute();
```

The [MySqlScript](#) class has several events associated with it. There are:

1. Error - generated in an error occurs.
2. ScriptCompleted - generated when the script successfully completes execution.

3. StatementExecuted - generated after each statement is executed.

It is possible to assign event handlers to each of these events. These user-provided routines will be called back should the connected event occur. The following code shows how the event handlers are set up.

```
script.Error += new MySqlScriptErrorHandler(script_Error);
script.ScriptCompleted += new EventHandler(script_ScriptCompleted);
script.StatementExecuted += new MySqlStatementExecutedEventHandler(script_StatementExecuted);
```

In VisualStudio you can use tab completion to fill out stub routines for you, to save typing. To do this start by typing, for example, “script.Error +=”. Then press **TAB**, and then press **TAB** again. The assignment will be completed, and a stub event handler created. A complete working example is shown below:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;

using System.Data;
using MySql.Data;
using MySql.Data.MySqlClient;

namespace MySqlScriptTest
{
    class Program
    {
        static void Main(string[] args)
        {
            string connStr = "server=localhost;user=root;database=TestDB;port=3306;password=*****;";
            MySqlConnection conn = new MySqlConnection(connStr);

            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();

                string sql = "INSERT INTO TestTable(name) VALUES ('Superman');" +
                            "INSERT INTO TestTable(name) VALUES ('Batman');" +
                            "INSERT INTO TestTable(name) VALUES ('Wolverine');" +
                            "INSERT INTO TestTable(name) VALUES ('Storm');";

                MySqlScript script = new MySqlScript(conn, sql);

                script.Error += new MySqlScriptErrorHandler(script_Error);
                script.ScriptCompleted += new EventHandler(script_ScriptCompleted);
                script.StatementExecuted += new MySqlStatementExecutedEventHandler(script_StatementExecuted);

                int count = script.Execute();

                Console.WriteLine("Executed " + count + " statement(s).");
                Console.WriteLine("Delimiter: " + script.Delimiter);
            }
            catch (Exception ex)
            {
                Console.WriteLine(ex.ToString());
            }

            conn.Close();
            Console.WriteLine("Done.");
        }

        static void script_StatementExecuted(object sender, MySqlScriptEventArgs args)
        {
            Console.WriteLine("script_StatementExecuted");
        }

        static void script_ScriptCompleted(object sender, EventArgs e)
        {
            //EventArgs e will be EventArgs.Empty for this method
            Console.WriteLine("script_ScriptCompleted!");
        }

        static void script_Error(Object sender, MySqlScriptEventArgs args)
        {
            Console.WriteLine("script_Error: " + args.Exception.ToString());
        }
    }
}
```

Note that in the `script_ScriptCompleted` event handler, the `EventArgs` parameter `e` will be `EventArgs.Empty`. In the case of the `ScriptCompleted` event there is no additional data to be obtained, which is why the event object is `EventArgs`.

22.2.4.8.1. Using Delimiters with MySqlScript

Depending on the nature of the script, you may need control of the delimiter used to separate the statements that will make up a

script. The most common example of this is where you have a multi-statement stored routine as part of your script. In this case if the default delimiter of “;” is used you will get an error when you attempt to execute the script. For example, consider the following stored routine:

```
CREATE PROCEDURE test_routine()
BEGIN
    SELECT name FROM TestTable ORDER BY name;
    SELECT COUNT(name) FROM TestTable;
END
```

This routine actually needs to be executed on the MySQL Server as a single statement. However, with the default delimiter of “;”, the [MySqlScript](#) class would interpret the above as two statements, the first being:

```
CREATE PROCEDURE test_routine()
BEGIN
    SELECT name FROM TestTable ORDER BY name;
```

Executing this as a statement would generate an error. To solve this problem [MySqlScript](#) supports the ability to set a different delimiter. This is achieved through the Delimiter property. For example, you could set the delimiter to “??”, in which case the above stored routine would no longer generate an error when executed. Multiple statements can be delimited in the script, so for example, you could have a three statement script such as:

```
string sql = "DROP PROCEDURE IF EXISTS test_routine??" +
    "CREATE PROCEDURE test_routine() " +
    "BEGIN " +
    "SELECT name FROM TestTable ORDER BY name;" +
    "SELECT COUNT(name) FROM TestTable;" +
    "END??" +
    "CALL test_routine();"
```

You can change the delimiter back at any point by setting the Delimiter property. The following code shows a complete working example:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;

using MySql.Data;
using MySql.Data.MySqlClient;

namespace ConsoleApplication8
{
    class Program
    {
        static void Main(string[] args)
        {
            string connStr = "server=localhost;user=root;database=TestDB;port=3306;password=*****;";
            MySqlConnection conn = new MySqlConnection(connStr);

            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();

                string sql =      "DROP PROCEDURE IF EXISTS test_routine??" +
                    "CREATE PROCEDURE test_routine() " +
                    "BEGIN " +
                    "SELECT name FROM TestTable ORDER BY name;" +
                    "SELECT COUNT(name) FROM TestTable;" +
                    "END??" +
                    "CALL test_routine();"

                MySqlScript script = new MySqlScript(conn);

                script.Query = sql;
                script.Delimiter = "?";
                int count = script.Execute();
                Console.WriteLine("Executed " + count + " statement(s)");
                script.Delimiter = ";";
                Console.WriteLine("Delimiter: " + script.Delimiter);
                Console.WriteLine("Query: " + script.Query);
            }
            catch (Exception ex)
            {
                Console.WriteLine(ex.ToString());
            }

            conn.Close();
            Console.WriteLine("Done.");
        }
    }
}
```

22.2.4.9. Tutorial: Generating MySQL DDL from an Entity Framework Model

In this tutorial you will learn how to create MySQL DDL from an Entity Framework model. You will need to use Visual Studio 2010 and MySQL Connector/NET 6.3 to carry out this tutorial.

1. Create a new console application in Visual Studio 2010.
2. Using the **SOLUTION EXPLORER** add a reference to [MySql.Data.Entity](#).
3. From the **SOLUTION EXPLORER** select ADD, NEW ITEM. In the **ADD NEW ITEM** dialog select **ONLINE TEMPLATES**. Select **ADO.NET ENTITY DATA MODEL** and click ADD. The **ENTITY DATA MODEL** dialog will be displayed.
4. In the **ENTITY DATA MODEL** dialog select **EMPTY MODEL**. Click FINISH. A blank model will be created.
5. Create a simple model. A single Entity will do for the purposes of this tutorial.
6. In the **PROPERTIES** panel select CONCEPTUALENTITYMODEL from the drop-down listbox.
7. In the **PROPERTIES** panel, locate the **DDL GENERATION TEMPLATE** in the category **DATABASE SCRIPT GENERATION**.
8. For the **DDL GENERATION** property select SSDLToMySQL.tt(VS) from the drop-down listbox.
9. Save the solution.
10. Right-click an empty space in the model design area. The context-sensitive menu will be displayed.
11. From the context-sensitive menu select GENERATE DATABASE FROM MODEL. The **GENERATE DATABASE WIZARD** dialog will be displayed.
12. In the **GENERATE DATABASE WIZARD** dialog select an existing connection, or create a new connection to a server. Select an appropriate radio button to show or hide sensitive data. For the purposes of this tutorial you can select **YES** (although you may not want to do this for commercial applications).
13. Click **NEXT**. MySQL compatible DDL code will be generated. Click **FINISH** to exit the wizard.

You have seen how to create MySQL DDL code from an Entity Framework model.

22.2.5. Connector/NET Programming

Connector/NET comprises several classes that are used to connect to the database, execute queries and statements, and manage query results.

The following are the major classes of Connector/NET:

- [MySqlCommand](#): Represents an SQL statement to execute against a MySQL database.
- [MySqlCommandBuilder](#): Automatically generates single-table commands used to reconcile changes made to a DataSet with the associated MySQL database.
- [MySqlConnection](#): Represents an open connection to a MySQL Server database.
- [MySqlDataAdapter](#): Represents a set of data commands and a database connection that are used to fill a data set and update a MySQL database.
- [MySqlDataReader](#): Provides a means of reading a forward-only stream of rows from a MySQL database.
- [MySqlException](#): The exception that is thrown when MySQL returns an error.
- [MySqlHelper](#): Helper class that makes it easier to work with the provider.
- [MySqlTransaction](#): Represents an SQL transaction to be made in a MySQL database.

In the following sections you will learn about some common use cases for Connector/NET, including BLOB handling, date handling, and using Connector/NET with common tools such as Crystal Reports.

22.2.5.1. Connecting to MySQL Using Connector/NET

Introduction

All interaction between a .NET application and the MySQL server is routed through a `MySqlConnection` object. Before your application can interact with the server, a `MySqlConnection` object must be instanced, configured, and opened.

Even when using the `MySqlHelper` class, a `MySqlConnection` object is created by the helper class.

In this section, we will describe how to connect to MySQL using the `MySqlConnection` object.

22.2.5.2. Creating a Connection String

The `MySqlConnection` object is configured using a connection string. A connection string contains sever key/value pairs, separated by semicolons. Each key/value pair is joined with an equal sign.

The following is a sample connection string:

```
Server=127.0.0.1;Uid=root;Pwd=12345;Database=test;
```

In this example, the `MySqlConnection` object is configured to connect to a MySQL server at `127.0.0.1`, with a user name of `root` and a password of `12345`. The default database for all statements will be the `test` database.

The following options are available:

Note

Using the '@' symbol for parameters is now the preferred approach although the old pattern of using '?' is still supported.

Please be aware however that using '@' can cause conflicts when user variables are also used. To help with this situation please see the documentation on the `Allow User Variables` connection string option, which can be found here: [Section 22.2.5.2, “Creating a Connection String”](#). The `Old Syntax` connection string option has now been deprecated.

22.2.5.2.1. Opening a Connection

Once you have created a connection string it can be used to open a connection to the MySQL server.

The following code is used to create a `MySqlConnection` object, assign the connection string, and open the connection.

Visual Basic Example

```
Dim conn As New MySql.Data.MySqlClient.MySqlConnection
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    conn.ConnectionString = myConnectionString
    conn.Open()

Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection();
    conn.ConnectionString = myConnectionString;
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

You can also pass the connection string to the constructor of the `MySqlConnection` class:

Visual Basic Example

```
Dim myConnectionString as String
myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

Once the connection is open it can be used by the other Connector/.NET classes to communicate with the MySQL server.

22.2.5.2.2. Handling Connection Errors

Because connecting to an external server is unpredictable, it is important to add error handling to your .NET application. When there is an error connecting, the `MySqlConnection` class will return a `MySqlException` object. This object has two properties that are of interest when handling errors:

- `Message`: A message that describes the current exception.
- `Number`: The MySQL error number.

When handling errors, you can your application's response based on the error number. The two most common error numbers when connecting are as follows:

- `0`: Cannot connect to server.
- `1045`: Invalid user name and/or password.

The following code shows how to adapt the application's response based on the actual error:

Visual Basic Example

```
Dim myConnectionString as String
myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    Select Case ex.Number
        Case 0
            MessageBox.Show("Cannot connect to server. Contact administrator")
        Case 1045
            MessageBox.Show("Invalid username/password, please try again")
    End Select
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    switch (ex.Number)
    {
        case 0:
            MessageBox.Show("Cannot connect to server. Contact administrator");
        case 1045:
            MessageBox.Show("Invalid username/password, please try again");
    }
}
```

Important

Note that if you are using multilanguage databases you must specify the character set in the connection string. If you do not specify the character set, the connection defaults to the `latin1` charset. You can specify the character set as part of the connection string, for example:

```
MySqlConnection myConnection = new MySqlConnection("server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;Charset=latin1;");
```

22.2.5.2.3. Using GetSchema on a Connection

The `GetSchema()` method of the connection object can be used to retrieve schema information about the database currently connected to. The schema information is returned in the form of a `DataTable`. The schema information is organised into a number of collections. Different forms of the `GetSchema()` method can be used depending on the information required. There are three forms of the `GetSchema()` method:

- `GetSchema()` - This call will return a list of available collections.
- `GetSchema(String)` - This call returns information about the collection named in the string parameter. If the string “`MetaDataCollections`” is used then a list of all available collections is returned. This is the same as calling `GetSchema()` without any parameters.
- `GetSchema(String, String[])` - In this call the first string parameter represents the collection name, and the second parameter represents a string array of restriction values. Restriction values limit the amount of data that will be returned. Restriction values are explained in more detail in the [Microsoft .NET documentation](#).

22.2.5.2.3.1. Collections

The collections can be broadly grouped into two types: collections that are common to all data providers, and collections specific to a particular provider.

Common

The following collections are common to all data providers:

- `MetaDataCollections`
- `DataSourceInformation`
- `DataTypes`
- `Restrictions`
- `ReservedWords`

Provider-specific

The following are the collections currently provided by MySQL Connector/NET, in addition to the common collections above:

- Databases
- Tables
- Columns
- Users
- Foreign Keys
- IndexColumns
- Indexes
- Foreign Key Columns
- UDF
- Views
- ViewColumns
- Procedure Parameters
- Procedures
- Triggers

Example Code

A list of available collections can be obtained using the following code:

```
using System;
using System.Data;
using System.Text;
using MySql.Data;
using MySql.Data.MySqlClient;

namespace ConsoleApplication2
{
    class Program
    {

        private static void DisplayData(System.Data.DataTable table)
        {
            foreach (System.Data DataRow row in table.Rows)
            {
                foreach (System.Data DataColumn col in table.Columns)
                {
                    Console.WriteLine("{0} = {1}", col.ColumnName, row[col]);
                }
                Console.WriteLine("=====");
            }
        }

        static void Main(string[] args)
        {

            string connStr = "server=localhost;user=root;database=world;port=3306;password=*****";
            MySqlConnection conn = new MySqlConnection(connStr);

            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();

                DataTable table = conn.GetSchema("MetaDataCollections");
                //DataTable table = conn.GetSchema("UDF");
                DisplayData(table);

                conn.Close();
            }
            catch (Exception ex)
            {
                Console.WriteLine(ex.ToString());
            }
            Console.WriteLine("Done.");
        }
    }
}
```

Further information on the `GetSchema()` method and schema collections can be found in the [Microsoft .NET documentation](#).

22.2.5.3. Using MySqlCommand

A MySqlCommand has the `CommandText` and `CommandType` properties associated with it. The `CommandText` will be handled differently depending on the setting of `CommandType`. `CommandType` can be one of:

1. Text - A SQL text command (default)
2. StoredProcedure - The name of a Stored Procedure
3. TableDirect - The name of a table (new in Connector/NET 6.2)

The default `CommandType`, `Text`, is used for executing queries and other SQL commands. Some example of this can be found in the following section [Section 22.2.4.1.2, “The MySqlCommand Object”](#).

If `CommandType` is set to `StoredProcedure`, `CommandText` should be set to the name of the Stored Procedure to access.

If `CommandType` is set to `TableDirect`, all rows and columns of the named table will be returned when you call one of the `Execute` methods. In effect, this command performs a `SELECT *` on the table specified. The `CommandText` property is set to the name of the table you wish to query. This is illustrated by the following code snippet:

```
...
MySqlCommand cmd = new MySqlCommand();
cmd.CommandText = "mytable";
cmd.Connection = someConnection;
cmd.CommandType = CommandType.TableDirect;
SqlDataReader reader = cmd.ExecuteReader();
while (reader.Read())
{
    Console.WriteLine(reader[0], reader[1]...);
}
...
```

Examples of using the `CommandType` of `StoredProcedure` can be found in the section [Section 22.2.5.6, “Accessing Stored Procedures with Connector/NET”](#).

Commands can have a timeout associated with them. This is useful as you may not want a situation were a command takes up an excessive amount of time. A timeout can be set using the `CommandTimeout` property. The following code snippet sets a timeout of one minute:

```
MySqlCommand cmd = new MySqlCommand();
cmd.CommandTimeout = 60;
```

The default value is 30 secs. A value of 0 indicates an indefinite wait and should be avoided. Note the default command timeout can be changed using the connection string option `Default Command Timeout`.

Prior to MySQL Connector/NET 6.2, `MySqlCommand.CommandTimeout` included user processing time, that is processing time not related to direct use of the connector. Timeout was implemented through a .NET Timer, that triggered after `CommandTimeout` seconds. This timer consumed a thread.

MySQL Connector/NET 6.2 introduced timeouts that are aligned with how Microsoft handles `SqlCommand.CommandTimeout`. This property is the cumulative timeout for all network reads and writes during command execution or processing of the results. A timeout can still occur in the `MySqlReader.Read` method after the first row is returned, and does not include user processing time, only IO operations. The 6.2 implementation uses the underlying stream timeout facility, so is more efficient in that it does not require the additional timer thread as was the case with the previous implementation.

Further details on this can be found in the relevant [Microsoft documentation](#).

22.2.5.4. Using Connector/NET with Connection Pooling

The Connector/NET supports connection pooling. This is enabled by default, but can be turned off using connection string options. See [Section 22.2.5.2, “Creating a Connection String”](#) for further information.

Connection pooling works by keeping the native connection to the server live when the client disposes of a `MySqlConnection`. Subsequently, if a new `MySqlConnection` object is opened, it will be created from the connection pool, rather than creating a new native connection. This improves performance.

To work as designed, it is best to let the connection pooling system manage all connections. You should not create a globally accessible instance of `MySqlConnection` and then manually open and close it. This interferes with the way the pooling works and

can lead to unpredictable results or even exceptions.

One approach that simplifies things is to avoid manually creating a `MySqlConnection` object. Instead use the overloaded methods that take a connection string as an argument. Using this approach, Connector/NET will automatically create, open, close and destroy connections, using the connection pooling system for best performance.

Typed Datasets and the `MembershipProvider` and `RoleProvider` classes use this approach. Most classes that have methods that take a `MySqlConnection` as an argument, also have methods that take a connection string as an argument. This includes `MySqlDataAdapter`.

Instead of manually creating `MySqlCommand` objects, you can use the static methods of the `MySqlHelper` class. These take a connection string as an argument, and they fully support connection pooling.

Starting with MySQL Connector/NET 6.2, there is a background job that runs every three minutes and removes connections from pool that have been idle (unused) for more than three minutes. The pool cleanup frees resources on both client and server side. This is because on the client side every connection uses a socket, and on the server side every connection uses a socket and a thread.

Prior to this change, connections were never removed from the pool, and the pool always contained the peak number of open connections. For example, a web application that peaked at 1000 concurrent database connections would consume 1000 threads and 1000 open sockets at the server, without ever freeing up those resources from the connection pool. Note, connections, no matter how old, will not be closed if the number of connections in the pool is less than or equal to the value set by the `Min Pool Size` connection string parameter.

22.2.5.5. Using the Connector/NET with Prepared Statements

Introduction

As of MySQL 4.1, it is possible to use prepared statements with Connector/NET. Use of prepared statements can provide significant performance improvements on queries that are executed more than once.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

22.2.5.5.1. Preparing Statements in Connector/NET

To prepare a statement, create a command object and set the `.CommandText` property to your query.

After entering your statement, call the `.Prepare` method of the `MySqlCommand` object. After the statement is prepared, add parameters for each of the dynamic elements in the query.

After you enter your query and enter parameters, execute the statement using the `.ExecuteNonQuery()`, `.ExecuteScalar()`, or `.ExecuteReader` methods.

For subsequent executions, you need only modify the values of the parameters and call the execute method again, there is no need to set the `.CommandText` property or redefine the parameters.

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = strConnection

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, @number, @text)"
    cmd.Prepare()

    cmd.Parameters.AddWithValue("@number", 1)
    cmd.Parameters.AddWithValue("@text", "One")

    For i = 1 To 1000
        cmd.Parameters("@number").Value = i
        cmd.Parameters("@text").Value = "A string value"

        cmd.ExecuteNonQuery()
    Next
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = strConnection;

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, @number, @text)";
    cmd.Prepare();

    cmd.Parameters.AddWithValue("@number", 1);
    cmd.Parameters.AddWithValue("@text", "One");

    for (int i=1; i <= 1000; i++)
    {
        cmd.Parameters["@number"].Value = i;
        cmd.Parameters["@text"].Value = "A string value";

        cmd.ExecuteNonQuery();
    }
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
                    "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

22.2.5.6. Accessing Stored Procedures with Connector/.NET

Introduction

With the release of MySQL version 5 the MySQL server now supports stored procedures with the SQL 2003 stored procedure syntax.

A stored procedure is a set of SQL statements that can be stored in the server. Once this has been done, clients do not need to keep reissuing the individual statements but can refer to the stored procedure instead.

Stored procedures can be particularly useful in situations such as the following:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures for all common operations. This provides a consistent and secure environment, and procedures can ensure that each operation is properly logged. In such a setup, applications and users would not get any access to the database tables directly, but can only execute specific stored procedures.

Connector/.NET supports the calling of stored procedures through the `MySqlCommand` object. Data can be passed in and out of a MySQL stored procedure through use of the `MySqlCommand.Parameters` collection.

Note

When you call a stored procedure, the command object makes an additional `SELECT` call to determine the parameters of the stored procedure. You must ensure that the user calling the procedure has the `SELECT` privilege on the `mysql.proc` table to enable them to verify the parameters. Failure to do this will result in an error when calling the procedure.

This section will not provide in-depth information on creating Stored Procedures. For such information, please refer to <http://dev.mysql.com/doc/mysql/en/stored-routines.html>.

A sample application demonstrating how to use stored procedures with Connector/.NET can be found in the `Samples` directory of your Connector/.NET installation.

22.2.5.6.1. Using Stored Routines from Connector/.NET

Stored procedures in MySQL can be created using a variety of tools. First, stored procedures can be created using the `mysql` command-line client. Second, stored procedures can be created using MySQL Workbench. Finally, stored procedures can be created using the `.ExecuteNonQuery` method of the `MySqlCommand` object.

It should be noted that, unlike the command-line and GUI clients, you are not required to specify a special delimiter when creating stored procedures in Connector/NET.

To call a stored procedure using Connector/NET, you create a `MySqlCommand` object and pass the stored procedure name as the `.CommandText` property. You then set the `. CommandType` property to `CommandType.StoredProcedure`.

After the stored procedure is named, you create one `MySqlCommand` parameter for every parameter in the stored procedure. `IN` parameters are defined with the parameter name and the object containing the value, `OUT` parameters are defined with the parameter name and the data type that is expected to be returned. All parameters need the parameter direction defined.

After defining the parameters, you call the stored procedure by using the `MySqlCommand.ExecuteNonQuery()` method.

Once the stored procedure is called, the values of the output parameters can be retrieved by using the `.Value` property of the `MySqlConnector.Parameters` collection.

Note

When a stored procedure is called using `MySqlCommand.ExecuteReader`, and the stored procedure has output parameters, the output parameters are only set after the `MySqlDataReader` returned by `ExecuteReader` is closed.

The following C# example code demonstrates the use of stored procedures. It assumes the database 'employees' has already been created:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;

using System.Data;
using MySql.Data;
using MySql.Data.MySqlClient;

namespace UsingStoredRoutines
{
    class Program
    {
        static void Main(string[] args)
        {
            MySqlConnection conn = new MySqlConnection();
            conn.ConnectionString = "server=localhost;user=root;database=employees;port=3306;password=*****";
            MySqlCommand cmd = new MySqlCommand();

            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();
                cmd.Connection = conn;
                cmd.CommandText = "DROP PROCEDURE IF EXISTS add_emp";
                cmd.ExecuteNonQuery();
                cmd.CommandText = "DROP TABLE IF EXISTS emp";
                cmd.ExecuteNonQuery();
                cmd.CommandText = "CREATE TABLE emp (empno INT UNSIGNED NOT NULL AUTO_INCREMENT PRIMARY KEY, first_name VARCHAR(20), last_name VARCHAR(20), bday DATETIME)";
                cmd.ExecuteNonQuery();

                cmd.CommandText = "CREATE PROCEDURE add_emp(" +
                    "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT)" +
                    "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " +
                    "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END";

                cmd.ExecuteNonQuery();
            }
            catch (MySqlException ex)
            {
                Console.WriteLine("Error " + ex.Number + " has occurred: " + ex.Message);
            }
            conn.Close();
            Console.WriteLine("Connection closed.");
            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();
                cmd.Connection = conn;

                cmd.CommandText = "add_emp";
                cmd.CommandType = CommandType.StoredProcedure;

                cmd.Parameters.AddWithValue("@lname", "Jones");
                cmd.Parameters["@lname"].Direction = ParameterDirection.Input;

                cmd.Parameters.AddWithValue("@fname", "Tom");
                cmd.Parameters["@fname"].Direction = ParameterDirection.Input;

                cmd.Parameters.AddWithValue("@bday", "1940-06-07");
                cmd.Parameters["@bday"].Direction = ParameterDirection.Input;

                cmd.Parameters.AddWithValue("@empno", MySqlDbType.Int32);
                cmd.Parameters["@empno"].Direction = ParameterDirection.Output;
            }
        }
    }
}
```

```
        cmd.ExecuteNonQuery();

        Console.WriteLine("Employee number: " + cmd.Parameters["@empno"].Value);
        Console.WriteLine("Birthday: " + cmd.Parameters["@bdy"].Value);
    }
    catch (MySql.Data.MySqlClient.MySqlException ex)
    {
        Console.WriteLine("Error " + ex.Number + " has occurred: " + ex.Message);
    }
    conn.Close();
    Console.WriteLine("Done.");
}
}
```

The following code shows the same application in Visual Basic:

```

Imports System
Imports System.Collections.Generic
Imports System.Linq
Imports System.Text

Imports System.Data
Imports MySql.Data
Imports MySql.Data.MySqlClient

Module Module1

Sub Main()
    Dim conn As New MySqlConnection()
    conn.ConnectionString = "server=localhost;user=root;database=world;port=3306;password=*****;"
    Dim cmd As New MySqlCommand()

    Try
        Console.WriteLine("Connecting to MySQL...")
        conn.Open()
        cmd.Connection = conn
        cmd.CommandText = "DROP PROCEDURE IF EXISTS add_emp"
        cmd.ExecuteNonQuery()
        cmd.CommandText = "DROP TABLE IF EXISTS emp"
        cmd.ExecuteNonQuery()
        cmd.CommandText = "CREATE TABLE emp (empno INT UNSIGNED NOT NULL AUTO_INCREMENT PRIMARY KEY, first_name VARCHAR(20), last_name VARCHAR(20), bday DATE, salary DECIMAL(10,2), hire_date DATE)"
        cmd.ExecuteNonQuery()

        cmd.CommandText = "CREATE PROCEDURE add_emp(" & "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATE, IN salary DECIMAL(10,2), IN hire_date DATE)"
        cmd.ExecuteNonQuery()
    Catch ex As MySqlException
        Console.WriteLine(("Error " & ex.Number & " has occurred: ") + ex.Message)
    End Try
    conn.Close()
    Console.WriteLine("Connection closed.")

    Try
        Console.WriteLine("Connecting to MySQL...")
        conn.Open()
        cmd.Connection = conn

        cmd.CommandText = "add_emp"
        cmd.CommandType = CommandType.StoredProcedure

        cmd.Parameters.AddWithValue("@lname", "Jones")
        cmd.Parameters("@lname").Direction = ParameterDirection.Input

        cmd.Parameters.AddWithValue("@fname", "Tom")
        cmd.Parameters("@fname").Direction = ParameterDirection.Input

        cmd.Parameters.AddWithValue("@bday", "1940-06-07")
        cmd.Parameters("@bday").Direction = ParameterDirection.Input

        cmd.Parameters.AddWithValue("@empno", MySqlDbType.Int32)
        cmd.Parameters("@empno").Direction = ParameterDirection.Output

        cmd.ExecuteNonQuery()

        Console.WriteLine("Employee number: " & cmd.Parameters("@empno").Value)
        Console.WriteLine("Birthday: " & cmd.Parameters("@bday").Value)
    Catch ex As MySql.Data.MySqlClient.MySqlException
        Console.WriteLine(("Error " & ex.Number & " has occurred: ") + ex.Message)
    End Try
    conn.Close()
    Console.WriteLine("Done.")

End Sub

End Module

```

22.2.5.7. Handling BLOB Data With Connector/NET

Introduction

One common use for MySQL is the storage of binary data in `BLOB` columns. MySQL supports four different `BLOB` data types: `TINYBLOB`, `BLOB`, `MEDIUMBLOB`, and `LONGBLOB`.

Data stored in a `BLOB` column can be accessed using Connector/NET and manipulated using client-side code. There are no special requirements for using Connector/NET with `BLOB` data.

Simple code examples will be presented within this section, and a full sample application can be found in the `Samples` directory of the Connector/NET installation.

22.2.5.7.1. Preparing the MySQL Server

The first step is using MySQL with `BLOB` data is to configure the server. Let's start by creating a table to be accessed. In my file tables, I usually have four columns: an `AUTO_INCREMENT` column of appropriate size (`UNSIGNED SMALLINT`) to serve as a primary key to identify the file, a `VARCHAR` column that stores the file name, an `UNSIGNED MEDIUMINT` column that stores the size of the file, and a `MEDIUMBLOB` column that stores the file itself. For this example, I will use the following table definition:

```
CREATE TABLE file(
  file_id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
  file_name VARCHAR(64) NOT NULL,
  file_size MEDIUMINT UNSIGNED NOT NULL,
  file MEDIUMBLOB NOT NULL);
```

After creating a table, you may need to modify the `max_allowed_packet` system variable. This variable determines how large of a packet (that is, a single row) can be sent to the MySQL server. By default, the server will only accept a maximum size of 1MB from our client application. If you do not intend to exceed 1MB, this should be fine. If you do intend to exceed 1MB in your file transfers, this number has to be increased.

The `max_allowed_packet` option can be modified using MySQL Administrator's Startup Variables screen. Adjust the Maximum permitted option in the Memory section of the Networking tab to an appropriate setting. After adjusting the value, click the `APPLY CHANGES` button and restart the server using the `Service Control` screen of MySQL Administrator. You can also adjust this value directly in the `my.cnf` file (add a line that reads `max_allowed_packet=xxM`), or use the `SET max_allowed_packet=xxM;` syntax from within MySQL.

Try to be conservative when setting `max_allowed_packet`, as transfers of `BLOB` data can take some time to complete. Try to set a value that will be adequate for your intended use and increase the value if necessary.

22.2.5.7.2. Writing a File to the Database

To write a file to a database we need to convert the file to a byte array, then use the byte array as a parameter to an `INSERT` query.

The following code opens a file using a `FileStream` object, reads it into a byte array, and inserts it into the `file` table:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

Dim SQL As String

Dim FileSize As UInt32
Dim rawData() As Byte
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    fs = New FileStream("c:\image.png", FileMode.Open, FileAccess.Read)
    FileSize = fs.Length

    rawData = New Byte(FileSize) {}
    fs.Read(rawData, 0, FileSize)
    fs.Close()

    conn.Open()

    SQL = "INSERT INTO file VALUES(NULL, @FileName, @FileSize, @File)"

    cmd.Connection = conn
    cmd.CommandText = SQL
    cmd.Parameters.AddWithValue("@FileName", strFileName)
    cmd.Parameters.AddWithValue("@FileSize", FileSize)
    cmd.Parameters.AddWithValue("@File", rawData)

    cmd.ExecuteNonQuery()

    MessageBox.Show("File Inserted into database successfully!", _
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)
```

```

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", _
    MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    fs = new FileStream(@"c:\image.png", FileMode.Open, FileAccess.Read);
    FileSize = fs.Length;

    rawData = new byte[FileSize];
    fs.Read(rawData, 0, FileSize);
    fs.Close();

    conn.Open();

    SQL = "INSERT INTO file VALUES(NULL, @FileName, @FileSize, @File)";

    cmd.Connection = conn;
    cmd.CommandText = SQL;
    cmd.Parameters.AddWithValue("@FileName", strFileName);
    cmd.Parameters.AddWithValue("@FileSize", FileSize);
    cmd.Parameters.AddWithValue("@File", rawData);

    cmd.ExecuteNonQuery();

    MessageBox.Show("File Inserted into database successfully!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The `Read` method of the `FileStream` object is used to load the file into a byte array which is sized according to the `Length` property of the `FileStream` object.

After assigning the byte array as a parameter of the `MySqlCommand` object, the `ExecuteNonQuery` method is called and the BLOB is inserted into the `file` table.

22.2.5.7.3. Reading a BLOB from the Database to a File on Disk

Once a file is loaded into the `file` table, we can use the `MySqlDataReader` class to retrieve it.

The following code retrieves a row from the `file` table, then loads the data into a `FileStream` object to be written to disk:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myData As MySqlDataReader
Dim SQL As String
Dim rawData() As Byte
Dim FileSize As UInt32
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

SQL = "SELECT file_name, file_size, file FROM file"

Try
    conn.Open()

```

```

cmd.Connection = conn
cmd.CommandText = SQL

myData = cmd.ExecuteReader

If Not myData.HasRows Then Throw New Exception("There are no BLOBs to save")

myData.Read()

FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"))
rawData = New Byte[FileSize] {}

myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize)

fs = New FileStream("C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write)
fs.Write(rawData, 0, FileSize)
fs.Close()

MessageBox.Show("File successfully written to disk!", "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

myData.Close()
conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataReader myData;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test";

SQL = "SELECT file_name, file_size, file FROM file";

try
{
    conn.Open();

    cmd.Connection = conn;
    cmd.CommandText = SQL;

    myData = cmd.ExecuteReader();

    if (! myData.HasRows)
        throw new Exception("There are no BLOBs to save");

    myData.Read();

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"));
    rawData = new byte[FileSize];

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize);

    fs = new FileStream(@"C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write);
    fs.Write(rawData, 0, FileSize);
    fs.Close();

    MessageBox.Show("File successfully written to disk!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    myData.Close();
    conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

After connecting, the contents of the `file` table are loaded into a `MySqlDataReader` object. The `GetBytes` method of the `MySqlDataReader` is used to load the BLOB into a byte array, which is then written to disk using a `FileStream` object.

The `GetOrdinal` method of the `MySqlDataReader` can be used to determine the integer index of a named column. Use of the `GetOrdinal` method prevents errors if the column order of the `SELECT` query is changed.

22.2.5.8. Using Connector/.NET with Crystal Reports

Introduction

Crystal Reports is a common tool used by Windows application developers to perform reporting and document generation. In this section we will show how to use Crystal Reports XI with MySQL and Connector/NET.

22.2.5.8.1. Creating a Data Source

When creating a report in Crystal Reports there are two options for accessing the MySQL data while designing your report.

The first option is to use Connector/ODBC as an ADO data source when designing your report. You will be able to browse your database and choose tables and fields using drag and drop to build your report. The disadvantage of this approach is that additional work must be performed within your application to produce a data set that matches the one expected by your report.

The second option is to create a data set in VB.NET and save it as XML. This XML file can then be used to design a report. This works quite well when displaying the report in your application, but is less versatile at design time because you must choose all relevant columns when creating the data set. If you forget a column you must re-create the data set before the column can be added to the report.

The following code can be used to create a data set from a query and write it to disk:

Visual Basic Example

```
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" +
    & "uid=root;" +
    & "pwd=12345;" +
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        & "country.name, country.population, country.continent " +
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myData.WriteXml("C:\dataset.xml", XmlWriteMode.WriteSchema)
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myData.WriteXml(@"C:\dataset.xml", XmlWriteMode.WriteSchema);
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

The resulting XML file can be used as an ADO.NET XML datasource when designing your report.

If you choose to design your reports using Connector/ODBC, it can be downloaded from dev.mysql.com.

22.2.5.8.2. Creating the Report

For most purposes the Standard Report wizard should help with the initial creation of a report. To start the wizard, open Crystal Reports and choose the New > Standard Report option from the File menu.

The wizard will first prompt you for a data source. If you are using Connector/ODBC as your data source, use the OLEDB provider for ODBC option from the OLE DB (ADO) tree instead of the ODBC (RDO) tree when choosing a data source. If using a saved data set, choose the ADO.NET (XML) option and browse to your saved data set.

The remainder of the report creation process is done automatically by the wizard.

After the report is created, choose the Report Options... entry of the File menu. Un-check the Save Data With Report option. This prevents saved data from interfering with the loading of data within our application.

22.2.5.8.3. Displaying the Report

To display a report we first populate a data set with the data needed for the report, then load the report and bind it to the data set. Finally we pass the report to the crViewer control for display to the user.

The following references are needed in a project that displays a report:

- CrystalDecisions.CrystalReports.Engine
- CrystalDecisions.ReportSource
- CrystalDecisions.Shared
- CrystalDecisions.Windows.Forms

The following code assumes that you created your report using a data set saved using the code shown in [Section 22.2.5.8.1, "Creating a Data Source"](#), and have a crViewer control on your form named `myViewer`.

Visual Basic Example

```
Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = _
    "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()

    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.SetDataSource(myData)
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;
```

```

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.SetDataSource(myData);
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

A new data set is generated using the same query used to generate the previously saved data set. Once the data set is filled, a ReportDocument is used to load the report file and bind it to the data set. The ReportDocument is passed as the ReportSource of the crViewer.

This same approach is taken when a report is created from a single table using Connector/ODBC. The data set replaces the table used in the report and the report is displayed properly.

When a report is created from multiple tables using Connector/ODBC, a data set with multiple tables must be created in our application. This enables each table in the report data source to be replaced with a report in the data set.

We populate a data set with multiple tables by providing multiple **SELECT** statements in our MySqlCommand object. These **SELECT** statements are based on the SQL query shown in Crystal Reports in the Database menu's Show SQL Query option. Assume the following query:

```

SELECT `country`.'Name', `country`.'Continent', `country`.'Population', `city`.'Name', `city`.'Population'
FROM `world`.`country` LEFT OUTER JOIN `world`.`city` ON `country`.'Code' = `city`.'CountryCode'
ORDER BY `country`.'Continent', `country`.'Name', `city`.'Name'

```

This query is converted to two **SELECT** queries and displayed with the following code:

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER BY countrycode, name;" _
        & "SELECT name, population, code, continent FROM country ORDER BY continent, name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0))
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1))
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

```

```

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER " +
        "BY countrycode, name; SELECT name, population, code, continent FROM " +
        "country ORDER BY continent, name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@"..\world_report.rpt");
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0));
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1));
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

It is important to order the `SELECT` queries in alphabetic order, as this is the order the report will expect its source tables to be in. One `SetDataSource` statement is needed for each table in the report.

This approach can cause performance problems because Crystal Reports must bind the tables together on the client-side, which will be slower than using a pre-saved data set.

22.2.5.9. Handling Date and Time Information in Connector/.NET

Introduction

MySQL and the .NET languages handle date and time information differently, with MySQL allowing dates that cannot be represented by a .NET data type, such as `'0000-00-00 00:00:00'`. These differences can cause problems if not properly handled.

In this section we will demonstrate how to properly handle date and time information when using Connector/.NET.

22.2.5.9.1. Problems when Using Invalid Dates

The differences in date handling can cause problems for developers who use invalid dates. Invalid MySQL dates cannot be loaded into native .NET `DateTime` objects, including `NULL` dates.

Because of this issue, .NET `DataSet` objects cannot be populated by the `Fill` method of the `MySqlDataAdapter` class as invalid dates will cause a `System.ArgumentOutOfRangeException` exception to occur.

22.2.5.9.2. Restricting Invalid Dates

The best solution to the date problem is to restrict users from entering invalid dates. This can be done on either the client or the server side.

Restricting invalid dates on the client side is as simple as always using the .NET `DateTime` class to handle dates. The `DateTime` class will only allow valid dates, ensuring that the values in your database are also valid. The disadvantage of this is that it is not useful in a mixed environment where .NET and non .NET code are used to manipulate the database, as each application must perform its own date validation.

Users of MySQL 5.0.2 and higher can use the new `traditional` SQL mode to restrict invalid date values. For information on using the `traditional` SQL mode, see [Section 5.1.7, “Server SQL Modes”](#).

22.2.5.9.3. Handling Invalid Dates

Although it is strongly recommended that you avoid the use of invalid dates within your .NET application, it is possible to use invalid dates by means of the `MySqlDateTime` data type.

The `MySqlDateTime` data type supports the same date values that are supported by the MySQL server. The default behavior of

Connector/NET is to return a .NET DateTime object for valid date values, and return an error for invalid dates. This default can be modified to cause Connector/NET to return `MySqlDateTime` objects for invalid dates.

To instruct Connector/NET to return a `MySqlDateTime` object for invalid dates, add the following line to your connection string:

```
Allow Zero Datetime=True
```

Please note that the use of the `MySqlDateTime` class can still be problematic. The following are some known issues:

1. Data binding for invalid dates can still cause errors (zero dates like 0000-00-00 do not seem to have this problem).
2. The `ToString` method returns a date formatted in the standard MySQL format (for example, `2005-02-23 08:50:25`). This differs from the `ToString` behavior of the .NET DateTime class.
3. The `MySqlDateTime` class supports NULL dates, while the .NET DateTime class does not. This can cause errors when trying to convert a MySQLDate to a DateTime if you do not check for NULL first.

Because of the known issues, the best recommendation is still to use only valid dates in your application.

22.2.5.9.4. Handling NULL Dates

The .NET `DateTime` data type cannot handle `NULL` values. As such, when assigning values from a query to a `DateTime` variable, you must first check whether the value is in fact `NULL`.

When using a `MySqlDataReader`, use the `.IsDBNull` method to check whether a value is `NULL` before making the assignment:

Visual Basic Example

```
If Not myReader.IsDBNull(myReader.GetOrdinal("mytime")) Then
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"))
Else
    myTime = DateTime.MinValue
End If
```

C# Example

```
if (! myReader.IsDBNull(myReader.GetOrdinal("mytime")))
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"));
else
    myTime = DateTime.MinValue;
```

`NULL` values will work in a data set and can be bound to form controls without special handling.

22.2.5.10. ASP.NET Provider Model

MySQL Connector/NET provides support for the ASP.NET 2.0 provider model. This model enables application developers to focus on the business logic of their application instead of having to recreate such boilerplate items as membership and roles support.

MySQL Connector/NET supplies the following providers:

- Membership Provider
- Role Provider
- Profile Provider
- Session State Provider (MySQL Connector/NET 6.1 and later)

The following tables show the supported providers, their default provider and the corresponding MySQL provider.

Membership Provider

Default Provider	MySQL Provider
System.Web.Security.SqlMembershipProvider	MySql.Web.Security.MySQLMembershipProvider

Role Provider

Default Provider	MySQL Provider
System.Web.Security.SqlRoleProvider	MySQL.Web.Security.MySQLRoleProvider

Profile Provider

Default Provider	MySQL Provider
System.Web.Profile.SqlProfileProvider	MySQL.Web.Profile.MySQLProfileProvider

SessionState Provider

Default Provider	MySQL Provider
System.Web.SessionState.InProcSessionStateStore	MySQL.Web.SessionState.MySqlSessionStateStore

Note

The MySQL Session State provider uses slightly different capitalization on the class name compared to the other MySQL providers.

Installing The Providers

The installation of Connector/Net 5.1 or later will install the providers and register them in your machine's .NET configuration file, `machine.config`. The additional entries created will result in the `system.web` section appearing similar to the following code:

```
<system.web>
  <processModel autoConfig="true" />
  <httpHandlers />
  <membership>
    <providers>
      <add name="AspNetSqlMembershipProvider" type="System.Web.Security.SqlMembershipProvider, System.Web, Version=2.0.0.0, Culture=neutral, PublicKeyToken=b03f5f7f1434493e" />
      <add name="MySQLMembershipProvider" type="MySQL.Web.Security.MySQLMembershipProvider, MySql.Web, Version=6.1.1.0, Culture=neutral, PublicKeyToken=c5687fc4b0d60ed1" />
    </providers>
  </membership>
  <profile>
    <providers>
      <add name="AspNetSqlProfileProvider" connectionStringName="LocalSqlServer" applicationName="/" type="System.Web.Profile.SqlProfileProvider, System.Web, Version=2.0.0.0, Culture=neutral, PublicKeyToken=b03f5f7f1434493e" />
      <add name="MySQLProfileProvider" type="MySQL.Web.Profile.MySQLProfileProvider, MySql.Web, Version=6.1.1.0, Culture=neutral, PublicKeyToken=c5687fc4b0d60ed1" />
    </providers>
  </profile>
  <roleManager>
    <providers>
      <add name="AspNetSqlRoleProvider" connectionStringName="LocalSqlServer" applicationName="/" type="System.Web.Security.SqlRoleProvider, System.Web, Version=2.0.0.0, Culture=neutral, PublicKeyToken=b03f5f7f1434493e" />
      <add name="AspNetWindowsTokenRoleProvider" applicationName="/" type="System.Web.Security.WindowsTokenRoleProvider, System.Web, Version=2.0.0.0, Culture=neutral, PublicKeyToken=b03f5f7f1434493e" />
      <add name="MySQLRoleProvider" type="MySQL.Web.Security.MySQLRoleProvider, MySql.Web, Version=6.1.1.0, Culture=neutral, PublicKeyToken=c5687fc4b0d60ed1" />
    </providers>
  </roleManager>
</system.web>
```

Each provider type can have multiple provider implementations. The default provider can also be set here using the `defaultProvider` attribute, but usually this is set in the `web.config` file either manually or by using the ASP.NET configuration tool.

At time of writing the `MySqlSessionStateStore` is not added to `machine.config` at install time, and so you would need to add the following:

```
<sessionState>
  <providers>
    <add name="MySqlSessionStateStore" type="MySQL.Web.SessionState.MySqlSessionStateStore, MySql.Web, Version=6.1.1.0, Culture=neutral, PublicKeyToken=c5687fc4b0d60ed1" />
  </providers>
</sessionState>
```

It should be pointed out that the SessionState Provider uses the `customProvider` attribute, rather than `defaultProvider`, to set the provider as the default. A typical `web.config` file might contain:

```
<system.web>
  <membership defaultProvider="MySQLMembershipProvider" />
  <roleManager defaultProvider="MySQLRoleProvider" />
  <profile defaultProvider="MySQLProfileProvider" />
  <sessionState customProvider="MySqlSessionStateStore" />
  <compilation debug="false">
    ...
  </compilation>
</system.web>
```

This sets the MySQL Providers as the defaults to be used in this web application.

The providers are implemented in the file `mysql.web.dll` and this file can be found in your MySQL Connector/NET installation folder. There is no need to run any type of SQL script to set up the database schema as the providers create and maintain the proper schema automatically.

Using The Providers

The easiest way to start using the providers is to use the ASP.NET configuration tool that is available on the Solution Explorer toolbar when you have a website project loaded.

In the web pages that open you will be able to select the MySQL membership and roles providers by indicating that you want to pick a custom provider for each area.

When the provider is installed, it creates a dummy connection string named `LocalMySqlServer`. This has to be done so that the provider will work in the ASP.NET configuration tool. However, you will want to override this connection string in your `web.config` file. You do this by first removing the dummy connection string and then adding in the proper one, as shown in the following example:

```
<connectionStrings>
  <remove name="LocalMySqlServer"/>
  <add name="LocalMySqlServer" connectionString="server=xxx;uid=xxx;pwd=xxx;database=xxx;" />
</connectionStrings>
```

Note the database you want to connect to must be specified.

Rather than manually editing configuration files it is recommended that you use the MySQL Website Configuration tool to config your desired provider setup. From MySQL Connector/NET 6.1.1 onwards all providers can be selected and configured from this wizard. The tool will modify your `website.config` file to the desired configuration. A tutorial on doing this is available in the following section [Section 22.2.3.10, “MySQL Website Configuration Tool”](#).

A tutorial demonstrating how to use the Membership and Role Providers can be found in the following section [Section 22.2.4.2, “Tutorial: MySQL Connector/NET ASP.NET Membership and Role Provider”](#).

Deployment

To use the providers on a production server you will need to distribute the `MySql.Data` and the `MySql.Web` assemblies and either register them in the remote systems Global Assembly Cache or keep them in your application's `bin/` directory.

22.2.5.11. Binary/Nonbinary Issues

There are certain situations where MySQL will return incorrect metadata about one or more columns. More specifically, the server will sometimes report that a column is binary when it is not and vice versa. In these situations, it becomes practically impossible for the connector to be able to correctly identify the correct metadat.

Some examples of situations that may return incorrect metadata are:

- Execution of `SHOW PROCESSLIST`. Some of the columns will be returned as binary even though they only hold string data.
- When a temp table is used to process a resultset, some columns may be returned with incorrect binary flags.
- Some server functions such `DATE_FORMAT` will incorrectly return the column as binary.

With the availability of `BINARY` and `VARBINARY` data types it is important that we respect the metadata returned by the sever. However, we are aware that some existing applications may break with this change so we are creating a connection string option to enable or disable it. By default, Connector/Net 5.1 will respect the binary flags returned by the server. This will mean that you may need to make small changes to your application to accomodate this change.

In the event that the changes required to your application would be too large, you can add 'respect binary flags=false' to your connection string. This will cause the connector to use the prior behavior. In a nutshell, that behavior was that any column that is marked as string, regardless of binary flags, will be returned as string. Only columns that are specifically marked as a `BLOB` will be returned as `BLOB`.

22.2.5.12. Character Sets

Treating Binary Blobs As UTF8

MySQL doesn't currently support 4 byte UTF8 sequences. This makes it difficult to represent some multi-byte languages such as Japanese. To try and alleviate this, Connector/Net now supports a mode where binary blobs can be treated as strings.

To do this, you set the 'Treat Blobs As UTF8' connection string keyword to yes. This is all that needs to be done to enable conversion of all binary blobs to UTF8 strings. If you wish to convert only some of your blob columns, then you can make use of the 'BlobAsUTF8IncludePattern' and 'BlobAsUTF8ExcludePattern' keywords. These should be set to the regular expression pattern that matches the column names you wish to include or exclude respectively.

One thing to note is that the regular expression patterns can both match a single column. When this happens, the include pattern is applied before the exclude pattern. The result, in this case, would be that the column would be excluded. You should also be aware that this mode does not apply to columns of type `BINARY` or `VARBINARY` and also do not apply to nonbinary `BLOB` columns.

Currently this mode only applies to reading strings out of MySQL. To insert 4-byte UTF8 strings into blob columns you will need to use the .NET `Encoding.GetBytes` function to convert your string to a series of bytes. You can then set this byte array as a parameter for a `BLOB` column.

22.2.5.13. Working with medium trust

.NET applications operate under a given trust level. Normal desktop applications operate under full trust while web applications that are hosted in shared environments are normally run under the medium trust level. Some hosting providers host shared applications in their own app pools and allow the application to run under full trust, but this seems to be the exception rather than the rule.

Connector/Net versions prior to 5.0.8 and 5.1.3 were not compatible with medium trust hosting. Starting with these versions, Connector/Net can be used under medium trust hosting that has been modified to allow the use of sockets for communication. By default, medium trust does not include `SocketPermission`. Connector/Net uses sockets to talk with the MySQL server so it is required that a new trust level be created that is an exact clone of medium trust but that has `SocketPermission` added.

22.2.5.14. Using the MySQL Connector/.NET Trace Source Object

MySQL Connector/.NET 6.2 introduced support for .NET 2.0 compatible tracing, using `TraceSource` objects.

The .NET 2.0 tracing architecture consists of four main parts:

- *Source* - This is the originator of the trace information. The source is used to send trace messages. The name of the source provided by MySQL Connector/.NET is `mysql`.
- *Switch* - This defines the level of trace information to emit. Typically, this is specified in the `app.config` file, so that it is not necessary to recompile an application to change the trace level.
- *Listener* - Trace listeners define where the trace information will be written to. Supported listeners include, for example, the Visual Studio Output window, the Windows Event Log, and the console.
- *Filter* - Filters can be attached to listeners. Filters determine the level of trace information that will be written. While a switch defines the level of information that will be written to all listeners, a filter can be applied on a per-listener basis, giving finer grained control of trace information.

To use tracing a `TraceSource` object first needs to be created. To create a `TraceSource` object in MySQL Connector/.NET you would use code similar to the following:

```
TraceSource ts = new TraceSource("mysql");
```

To enable trace messages you also need to configure a trace switch. There are three main switch classes, `BooleanSwitch`, `SourceSwitch`, and `TraceSwitch`. Trace switches also have associated with them a trace level enumeration, these are `Off`, `Error`, `Warning`, `Info`, and `Verbose`. The following code snippet illustrates creating a switch:

```
ts.Switch = new SourceSwitch("MySwitch", "Verbose");
```

This creates a `SourceSwitch`, called `MySwitch`, and sets the trace level to `Verbose`, meaning that all trace messages will be written.

It is convenient to be able to change the trace level without having to recompile the code. This is achieved by specifying the trace level in application configuration file, `app.config`. You then simply need to specify the desired trace level in the configuration file and restart the application. The trace source is configured within the `system.diagnostics` section of the file. The following XML snippet illustrates this:

```
<configuration>
  ...
  <system.diagnostics>
    <sources>
      <source name="mysql" switchName="MySwitch"
             switchType="System.Diagnostics.SourceSwitch" />
    ...
  </system.diagnostics>
</configuration>
```

```

</sources>
<switches>
  <add name="MySwitch" value="Verbose" />
  ...
</switches>
</system.diagnostics>
...
</configuration>

```

By default trace information is written to the Output window of Microsoft Visual Studio. However, there are a wide range of listeners than can be attached to the trace source, so that trace messages can be written out to various destinations. It is also possible to create custom listeners to allow trace messages to be written to other destinations as mobile devices and web services. A commonly used example of a listener is [ConsoleTraceListener](#), which writes trace messages to the console.

To add a listener at run time you can use code such as the following:

```
ts.Listeners.Add(new ConsoleTraceListener());
```

You can then call methods on trace source object to generate trace information. For example, the [TraceInformation\(\)](#), [TraceEvent\(\)](#), or [TraceData\(\)](#) methods can be used.

The [TraceInformation\(\)](#) method simply prints a string passed as a parameter. The [TraceEvent\(\)](#) method, as well as the optional informational string, requires a [TraceEventType](#) value to be passed to indicate the trace message type, and also an application specific ID. The [TraceEventType](#) can have a value of [Verbose](#), [Information](#), [Warning](#), [Error](#), and [Critical](#). Using the [TraceData\(\)](#) method you can pass any object, for example an exception object, instead of a message.

To ensure than these generated trace messages gets flushed from the trace source buffers to listeners, you need to invoke the [Flush\(\)](#) method. When you are finished using a trace source, you should call the [Close\(\)](#) method. The [Close\(\)](#) method first calls [Flush\(\)](#), to ensure any remaining data is written out. It then frees up resources, and closes the listeners associated with the trace source.

```

ts.TraceInformation("Informational message");
ts.TraceEvent(TraceEventType.Error, 3, "Optional error message");
ts.TraceData(TraceEventType.Error, 3, ex); // pass exception object
ts.Flush();
...
ts.Close();

```

22.2.5.14.1. Viewing MySQL Trace Information

This section describes how to set up your application to view MySQL trace information.

The first thing you need to do is create a suitable [app.config](#) file for your application. An example is shown in the following code:

```

<?xml version="1.0" encoding="utf-8" ?>
<configuration>
  <system.diagnostics>
    <sources>
      <source name="mysql" switchName="SourceSwitch"
        switchType="System.Diagnostics.SourceSwitch" >
        <listeners>
          <add name="console" />
          <remove name ="Default" />
        </listeners>
      </source>
    </sources>
    <switches>
      <!-- You can set the level at which tracing is to occur -->
      <add name="SourceSwitch" value="Verbose" />
      <!-- You can turn tracing off -->
      <!--add name="SourceSwitch" value="Off" -->
    </switches>
    <sharedListeners>
      <add name="console"
        type="System.Diagnostics.ConsoleTraceListener"
        initializeData="false"/>
    </sharedListeners>
  </system.diagnostics>
</configuration>

```

This ensures a suitable trace source is created, along with a switch. The switch level in this case is set to [Verbose](#) to display the maximum amount of information.

In the application the only other step required is to add [logging=true](#) to the connection string. An example application could be:

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Diagnostics;
using MySql.Data;
using MySql.Data.MySqlClient;
using MySql.Web;

namespace ConsoleApplication1
{
    class Program
    {
        static void Main(string[] args)
        {

            string connStr = "server=localhost;user=root;database=world;port=3306;password=*****;logging=true";
            MySqlConnection conn = new MySqlConnection(connStr);
            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();

                string sql = "SELECT Name, HeadOfState FROM Country WHERE Continent='Oceania'";
                MySqlCommand cmd = new MySqlCommand(sql, conn);
                MySqlDataReader rdr = cmd.ExecuteReader();

                while (rdr.Read())
                {
                    Console.WriteLine(rdr[0] + " -- " + rdr[1]);
                }

                rdr.Close();
                conn.Close();
            }
            catch (Exception ex)
            {
                Console.WriteLine(ex.ToString());
            }
            Console.WriteLine("Done.");
        }
    }
}

```

This simple application will then generate the following output:

```

Connecting to MySQL...
mysql Information: 1 : 1: Connection Opened: connection string = 'server=localhost;User Id=root;database=world;port=3306;password=*****;logging=True'
mysql Information: 3 : 1: Query Opened: SHOW VARIABLES
mysql Information: 4 : 1: Resultset Opened: field(s) = 2, affected rows = -1, inserted id = -1
mysql Information: 5 : 1: Resultset Closed. Total rows=272, skipped rows=0, size (bytes)=7058
mysql Information: 6 : 1: Query Closed
mysql Information: 3 : 1: Query Opened: SHOW COLLATION
mysql Information: 4 : 1: Resultset Opened: field(s) = 6, affected rows = -1, inserted id = -1
mysql Information: 5 : 1: Resultset Closed. Total rows=127, skipped rows=0, size (bytes)=4102
mysql Information: 6 : 1: Query Closed
mysql Information: 3 : 1: Query Opened: SET character_set_results=NULL
mysql Information: 4 : 1: Resultset Opened: field(s) = 0, affected rows = 0, inserted id = 0
mysql Information: 5 : 1: Resultset Closed. Total rows=0, skipped rows=0, size (bytes)=0
mysql Information: 6 : 1: Query Closed
mysql Information: 10 : 1: Set Database: world
mysql Information: 3 : 1: Query Opened: SELECT Name, HeadOfState FROM Country WHERE Continent='Oceania'
mysql Information: 4 : 1: Resultset Opened: field(s) = 2, affected rows = -1, inserted id = -1
American Samoa -- George W. Bush
Australia -- Elisabeth II
...
Wallis and Futuna -- Jacques Chirac
Vanuatu -- John Bani
United States Minor Outlying Islands -- George W. Bush
mysql Information: 5 : 1: Resultset Closed. Total rows=28, skipped rows=0, size (bytes)=788
mysql Information: 6 : 1: Query Closed
Done.
mysql Information: 2 : 1: Connection Closed

```

The first number displayed in the trace message corresponds to the MySQL event type:

Event	Description
1	ConnectionOpened: connection string
2	ConnectionClosed:
3	QueryOpened: mysql server thread id, query text
4	ResultOpened: field count, affected rows (-1 if select), inserted id (-1 if select)
5	ResultClosed: total rows read, rows skipped, size of resultset in bytes
6	QueryClosed:

Event	Description
7	StatementPrepared: prepared sql, statement id
8	StatementExecuted: statement id, mysql server thread id
9	StatementClosed: statement id
10	NonQuery: [varies]
11	UsageAdvisorWarning: usage advisor flag. NoIndex = 1, BadIndex = 2, SkippedRows = 3, SkippedColumns = 4, FieldConversion = 5.
12	Warning: level, code, message
13	Error: error number, error message

The second number displayed in the trace message is the connection count.

Although this example uses the `ConsoleTraceListener`, any of the other standard listeners could have been used. Another possibility is to create a custom listener that uses the information passed using the `TraceEvent` method. For example, a custom trace listener could be created to perform active monitoring of the MySQL event messages, rather than simply writing these to an output device.

It is also possible to add listeners to the MySQL Trace Source at run time. This can be done with the following code:

```
MySQLTrace.Listeners.Add(new ConsoleTraceListener());
```

MySQL Connector/.NET 6.3.2 introduced the ability to switch tracing on and off at run time. This can be achieved using the calls `MySQLTrace.EnableQueryAnalyzer(string host, int postInterval)` and `MySQLTrace.DisableQueryAnalyzer()`. The parameter `host` is the URL of the MySQL Enterprise Monitor server to monitor. The parameter `postInterval` is how often the data should be periodically posted to MySQL Enterprise Monitor, in seconds.

22.2.5.14.2. Building Custom Listeners

To build custom listeners that work with the MySQL Connector/.NET Trace Source, it is necessary to understand the key methods used, and the event data formats used.

The main method involved in passing trace messages is the `TraceSource.TraceEvent` method. This has the prototype:

```
public void TraceEvent(
    TraceEventType eventType,
    int id,
    string format,
    params Object[] args
)
```

This trace source method will process the list of attached listeners and call the listener's `TraceListener.TraceEvent` method. The prototype for the `TraceListener.TraceEvent` method is as follows:

```
public virtual void TraceEvent(
    TraceEventCache eventCache,
    string source,
    TraceEventType eventType,
    int id,
    string format,
    params Object[] args
)
```

The first three parameters are used in the standard as defined by Microsoft. The last three parameters contain MySQL-specific trace information. Each of these parameters is now discussed in more detail.

int id

This is a MySQL-specific identifier. It identifies the MySQL event type that has occurred, resulting in a trace message being generated. This value is defined by the `MySQLTraceEventType` public enum contained in the MySQL Connector/.NET code:

```
public enum MySQLTraceEventType : int
{
    ConnectionOpened = 1,
    ConnectionClosed,
    QueryOpened,
    ResultOpened,
    ResultClosed,
    QueryClosed,
    StatementPrepared,
    StatementExecuted,
    StatementClosed,
```

```

    NonQuery,
    UsageAdvisorWarning,
    Warning,
    Error
}

```

The MySQL event type also determines the contents passed using the parameter `params Object[] args`. The nature of the `args` parameters are described in further detail in the following material.

`string format`

This is the format string that contains zero or more format items, which correspond to objects in the `args` array. This would be used by a listener such as `ConsoleTraceListener` to write a message to the output device.

`params Object[] args`

This is a list of objects that depends on the MySQL event type, `id`. However, the first parameter passed using this list is always the driver id. The driver id is a unique number that is incremented each time the connector is opened. This enables groups of queries on the same connection to be identified. The parameters that follow driver id depend of the MySQL event id, and are as follows:

MySQL-specific event type	Arguments (params Object[] args)
ConnectionOpened	Connection string
ConnectionClosed	No additional parameters
QueryOpened	mysql server thread id, query text
ResultOpened	field count, affected rows (-1 if select), inserted id (-1 if select)
ResultClosed	total rows read, rows skipped, size of resultset in bytes
QueryClosed	No additional parameters
StatementPrepared	prepared sql, statement id
StatementExecuted	statement id, mysql server thread id
StatementClosed	statement id
NonQuery	Varies
UsageAdvisorWarning	usage advisor flag. NoIndex = 1, BadIndex = 2, SkippedRows = 3, SkippedColumns = 4, FieldConversion = 5.
Warning	level, code, message
Error	error number, error message

This information will allow you to create custom trace listeners that can actively monitor the MySQL-specific events.

22.2.5.15. Using the Bulk Loader

MySQL Connector/.NET features a bulk loader class that wraps the MySQL statement `LOAD DATA INFILE`. This gives MySQL Connector/.NET the ability to load a data file from a local or remote host to the server. The class concerned is `MySqlBulkLoader`. This class has various methods, the main one being `load` to cause the specified file to be loaded to the server. Various parameters can be set to control how the data file is processed. This is achieved through setting various properties of the class. For example, the field separator used, such as comma or tab, can be specified, along with the record terminator, such as newline.

The following code shows a simple example of using the `MySqlBulkLoader` class. First an empty table needs to be created, in this case in the `test` database:

```

CREATE TABLE Career (
    Name VARCHAR(100) NOT NULL,
    Age INTEGER,
    Profession VARCHAR(200)
);

```

A simple tab-delimited data file is also created (it could use any other field delimiter such as comma):

```

Table Career in Test Database
Name Age Profession
Tony 47 Technical Writer
Ana 43 Nurse
Fred 21 IT Specialist
Simon 45 Hairy Biker

```

Note that with this test file the first three lines will need to be ignored, as they do not contain table data. This can be achieved using the `NumberOfLinesToSkip` property. This file can then be loaded and used to populate the `Career` table in the `test` database:

```
using System;
using System.Text;
using MySql.Data;
using MySql.Data.MySqlClient;

namespace ConsoleApplication1
{
    class Program
    {
        static void Main(string[] args)
        {

            string connStr = "server=localhost;user=root;database=test;port=3306;password=*****";
            MySqlConnection conn = new MySqlConnection(connStr);

            MySqlBulkLoader bl = new MySqlBulkLoader(conn);
            bl.TableName = "Career";
            bl.FieldTerminator = "\t";
            bl.LineTerminator = "\n";
            bl.FileName = "c:/career_data.txt";
            bl.NumberOfLinesToSkip = 3;

            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();

                // Upload data from file
                int count = bl.Load();
                Console.WriteLine(count + " lines uploaded.");

                string sql = "SELECT Name, Age, Profession FROM Career";
                MySqlCommand cmd = new MySqlCommand(sql, conn);
                MySqlDataReader rdr = cmd.ExecuteReader();

                while (rdr.Read())
                {
                    Console.WriteLine(rdr[0] + " -- " + rdr[1] + " -- " + rdr[2]);
                }

                rdr.Close();
                conn.Close();
            }
            catch (Exception ex)
            {
                Console.WriteLine(ex.ToString());
            }
            Console.WriteLine("Done.");
        }
    }
}
```

Further information on `LOAD DATA INFILE` can be found in [Section 12.2.6, “`LOAD DATA INFILE` Syntax”](#). Further information on `MySqlBulkLoader` can be found in the reference documentation that was included with your connector.

22.2.6. Connector/NET Connection String Options Reference

Name	Default	Description
<code>Allow Batch</code>	true	When true, multiple SQL statements can be sent with one command execution. -Note- Starting with MySQL 4.1.1, batch statements should be separated by the server-defined separator character. Commands sent to earlier versions of MySQL should be separated with ';
<code>Allow User Variables</code>	false	Setting this to <code>true</code> indicates that the provider expects user variables in the SQL. This option was added in Connector/NET version 5.2.2.
<code>Allow ZeroDatetime</code>	false	If set to <code>True</code> , <code>MySqlDataReader.GetValue()</code> will return a <code>MySqlDateTime</code> object for date or datetime columns that have illegal values, such as zero datetime values, and a <code>System.DateTime</code> object for legal values. If set to <code>False</code> (the default setting) it will cause a <code>System.DateTime</code> object to be returned for all legal values and an exception to be thrown for illegal values, such as zero datetime values.
<code>AutoEnlist</code>	true	If <code>AutoEnlist</code> is set to <code>true</code> , which is the default, a connection opened using <code>TransactionScope</code> participates in this scope, it commits when the scope commits and rolls back if <code>TransactionScope</code> does not commit. However, this feature is considered security sensitive and therefore cannot be used in a medium trust environment.

Name	Default	Description
<code>BlobAsUTF8ExcludePattern</code>	null	
<code>BlobAsUTF8IncludePattern</code>	null	
<code>CertificateFile</code>	null	This option specifies the path to a certificate file in PFX format. For an example of usage see Section 22.2.4.7, “Tutorial: Using SSL with MySQL Connector/.NET” . Was introduced with 6.2.1.
<code>CertificatePassword</code>	null	This option enables you to specify a password which is used in conjunction with a certificate specified using the option <code>CertificateFile</code> . For an example of usage see Section 22.2.4.7, “Tutorial: Using SSL with MySQL Connector/.NET” . Was introduced with 6.2.1.
<code>Certificate Store Location</code>	null	This option enables you to access a certificate held in a personal store, rather than use a certificate file and password combination. For an example of usage see Section 22.2.4.7, “Tutorial: Using SSL with MySQL Connector/.NET” . Was introduced with 6.2.1.
<code>Certificate Thumbprint</code>	null	This option enables you to specify a certificate thumbprint to ensure correct identification of a certificate contained within a personal store. For an example of usage see Section 22.2.4.7, “Tutorial: Using SSL with MySQL Connector/.NET” . Was introduced with 6.2.1.
<code>CharSet, Character Set</code>		Specifies the character set that should be used to encode all queries sent to the server. Resultsets are still returned in the character set of the data returned.
<code>Connect Timeout, Connection Timeout</code>	15	The length of time (in seconds) to wait for a connection to the server before terminating the attempt and generating an error.
<code>Connection Reset</code>	false	If true, the connection state will be reset when it is retrieved from the pool. If set to false this avoids making an additional server round trip when obtaining a connection, but the connection state is not reset.
<code>Convert ZeroDatetime</code>	false	True to have <code>MySqlDataReader.GetValue()</code> and <code>MySqlDataReader.GetDateTime()</code> return <code>DateTime.MinValue</code> for date or datetime columns that have illegal values.
<code>Default Command Timeout</code>	30	Sets the default value of the command timeout to be used. This does not supercede the individual command timeout property on an individual command object. If you set the command timeout property, that will be used. This option was added in Connector/.NET 5.1.4
<code>Encrypt, UseSSL</code>	false	For Connector/.NET 5.0.3 and later, when <code>true</code> , SSL encryption is used for all data sent between the client and server if the server has a certificate installed. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> . In versions before 5.0.3, this option had no effect. From version 6.2.1 this option is deprecated and is replaced by <code>SSL Mode</code> . However, the option is still supported if used. If this option is set to <code>true</code> it is equivalent to <code>SSL Mode = Preferred</code> .
<code>FunctionsReturnString</code>	false	This will cause the connector to return binary/varbinary values as strings, if they do not have a tablename in the metadata.
<code>Host, Server, Data Source, Data-Source, Address, Addr, Network Address</code>	localhost	The name or network address of the instance of MySQL to which to connect. Multiple hosts can be specified separated by &. This can be useful where multiple MySQL servers are configured for replication and you are not concerned about the precise server you are connecting to. No attempt is made by the provider to synchronize writes to the database so care should be taken when using this option. In Unix environment with Mono, this can be a fully qualified path to MySQL socket file name. With this configuration, the Unix socket will be used instead of TCP/IP socket. Currently only a single socket name can be given so accessing MySQL in a replicated environment using Unix sockets is not currently supported.
<code>Ignore Prepare</code>	true	When true, instructs the provider to ignore any calls to <code>MySqlCommand.Prepare()</code> . This option is provided to prevent issues with corruption of the statements when use with server side prepared statements. If you want to use server-side prepare statements, set this option to false. This option was added in Connector/.NET 5.0.3 and Connector/.NET 1.0.9.
<code>Initial Catalog, Database</code>	mysql	The name of the database to use intially
<code>Interactive, InteractiveSession</code>	false	If set to true the client is interactive. An interactive client is one where the server variable <code>CLIENT_INTERACTIVE</code> is set. If an interactive

Name	Default	Description
		client is set, the <code>wait_timeout</code> variable is set to the value of <code>interactive_timeout</code> . The client will then timeout after this period of inactivity. More details can be found in the server manual Section 5.1.4, “Server System Variables” .
<code>Logging</code>	false	When true, various pieces of information is output to any configured TraceListeners. See Section 22.2.5.14, “Using the MySQL Connector/NET Trace Source Object” for further details.
<code>Old_Guids</code>	false	This option was introduced in Connector/NET 6.1.1. The backend representation of a GUID type was changed from <code>BINARY(16)</code> to <code>CHAR(36)</code> . This was done to allow developers to use the server function <code>UUID()</code> to populate a GUID table - <code>UUID()</code> generates a 36-character string. Developers of older applications can add 'Old_Guids=true' to the connection string to use a GUID of data type <code>BINARY(16)</code> .
<code>Old_Syntax, OldSyntax</code>	false	This option was deprecated in Connector/NET 5.2.2. All code should now be written using the '@' symbol as the parameter marker.
<code>Password, pwd</code>		The password for the MySQL account being used.
<code>Persist_Security_Info</code>	false	When set to <code>false</code> or <code>no</code> (strongly recommended), security-sensitive information, such as the password, is not returned as part of the connection if the connection is open or has ever been in an open state. Resetting the connection string resets all connection string values including the password. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> .
<code>Pipe_Name, Pipe</code>	mysql	When set to the name of a named pipe, the <code>MySqlConnection</code> will attempt to connect to MySQL on that named pipe. This settings only applies to the Windows platform.
<code>Port</code>	3306	The port MySQL is using to listen for connections. This value is ignored if Unix socket is used.
<code>Procedure_Cache_Size</code>	25	Sets the size of the stored procedure cache. By default, Connector/NET will store the metadata (input/output data types) about the last 25 stored procedures used. To disable the stored procedure cache, set the value to zero (0). This option was added in Connector/NET 5.0.2 and Connector/NET 1.0.9.
<code>Protocol</code>	socket	Specifies the type of connection to make to the server. Values can be: <code>socket</code> or <code>tcp</code> for a socket connection, <code>pipe</code> for a named pipe connection, <code>unix</code> for a Unix socket connection, <code>memory</code> to use MySQL shared memory.
<code>Respect_Binary_Flags</code>	true	Setting this option to <code>false</code> means that Connector/NET will ignore a column's binary flags as set by the server. This option was added in Connector/NET version 5.1.3.
<code>Shared_Memory_Name</code>	MYSQL	The name of the shared memory object to use for communication if the connection protocol is set to <code>memory</code> .
<code>Sql_Server_Mode</code>	false	Allow SQL Server syntax. When set to <code>true</code> enables Connector/NET to support square brackets around symbols instead of backticks. This enables Visual Studio wizards that bracket symbols with [] to work with Connector/NET. This option incurs a performance hit, so should only be used if necessary. This option was added in version 6.3.1.
<code>SSL_Mode</code>	None	<p>This option has the following values:</p> <ul style="list-style-type: none"> • None - do not use SSL. • Preferred - use SSL if the server supports it, but allow connection in all cases. • Required - Always use SSL. Deny connection if server does not support SSL. • VerifyCA - Always use SSL. Validate the CA but tolerate name mismatch. • VerifyFull - Always use SSL. Fail if the host name is not correct.

Name	Default	Description
		This option was introduced in MySQL Connector.NET 6.2.1.
TreatBlobsAsUTF8	false	
Treat Tiny As Boolean	true	Setting this value to <code>false</code> indicates that <code>TINYINT(1)</code> will be treated as an <code>INT</code> . See also Section 10.1.1, “Overview of Numeric Types” for a further explanation of the <code>TINYINT</code> and <code>BOOL</code> data types.
Use Affected Rows	false	When <code>true</code> the connection will report changed rows instead of found rows. This option was added in Connector.NET version 5.2.6.
Use Procedure Bodies	true	When set to <code>true</code> , the default value, MySQL Connector.NET expects the body of the procedure to be viewable. This enables it to determine the parameter types and order. The option should be set to <code>false</code> when the user connecting to the database does not have the <code>SELECT</code> privileges for the <code>mysql.proc</code> (stored procedures) table, or cannot view <code>I_S.ROUTINES</code> . In this case, MySQL Connector.NET will not be able to determine the types and order of the parameters, and must be alerted to this fact by setting this option to <code>false</code> . When set to <code>false</code> , MySQL Connector.NET will not rely on this information being available when the procedure is called. Because MySQL Connector.NET will not be able to determine this information, you should explicitly set the types of all the parameters before the call and the parameters should be added to the command in the same order as they appear in the procedure definition. This option was added in MySQL Connector.NET 5.0.4 and MySQL Connector.NET 1.0.10.
User Id, Username, Uid, User name		The MySQL login account being used.
Use Compression	false	<p>Setting this option to <code>true</code> enables compression of packets exchanged between the client and the server. This exchange is defined by the MySQL client/server protocol.</p> <p>Compression is used if both client and server support ZLIB compression, and the client has requested compression using this option.</p> <p>A compressed packet header is: packet length (3 bytes), packet number (1 byte), and Uncompressed Packet Length (3 bytes). The Uncompressed Packet Length is the number of bytes in the original, uncompressed packet. If this is zero then the data in this packet has not been compressed. When the compression protocol is in use, either the client or the server may compress packets. However, compression will not occur if the compressed length is greater than the original length. Thus, some packets will contain compressed data while other packets will not.</p>
Use Usage Advisor	false	
Use Performance Monitor	false	

The following table lists the valid names for connection pooling values within the `ConnectionString`. For more information about connection pooling, see Connection Pooling for the MySQL Data Provider.

Name	Default	Description
Cache Server Configuration, CacheServerConfiguration, CacheServerConfig	false	Specifies whether server variables should be updated when a pooled connection is returned. Turning this on will yield faster opens but will also not catch any server changes made by other connections.
Connection Lifetime	0	When a connection is returned to the pool, its creation time is compared with the current time, and the connection is destroyed if that time span (in seconds) exceeds the value specified by <code>Connection Lifetime</code> . This is useful in clustered configurations to force load balancing between a running server and a server just brought online. A value of zero (0) causes pooled connections to have the maximum connection timeout.
Max Pool Size	100	The maximum number of connections allowed in the pool.
Min Pool Size	0	The minimum number of connections allowed in the pool.

Name	Default	Description
Pooling	true	When <code>true</code> , the <code>MySqlConnection</code> object is drawn from the appropriate pool, or if necessary, is created and added to the appropriate pool. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> .

22.2.7. Connector/NET API Reference

This section of the manual contains a complete reference to the Connector/NET ADO.NET component, automatically generated from the embedded documentation.

22.2.7.1. `MySql.Data.MySqlClient`

[Namespace hierarchy](#)

Classes

Class	Description
<code>MySqlCommand</code>	
<code>MySqlCommandBuilder</code>	
<code>MySqlConnection</code>	
<code>MySqlDataAdapter</code>	
<code>MySqlDataReader</code>	Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.
<code>MySqlError</code>	Collection of error codes that can be returned by the server
<code>MySqlException</code>	The exception that is thrown when MySQL returns an error. This class cannot be inherited.
<code> MySqlHelper</code>	Helper class that makes it easier to work with the provider.
<code> MySqlInfoMessageEventArgs</code>	Provides data for the InfoMessage event. This class cannot be inherited.
<code> MySqlParameter</code>	Represents a parameter to a <code>MySqlCommand</code> , and optionally, its mapping to DataSetcolumns. This class cannot be inherited.
<code> MySqlParameterCollection</code>	Represents a collection of parameters relevant to a <code>MySqlCommand</code> as well as their respective mappings to columns in a DataSet. This class cannot be inherited.
<code> MySqlRowUpdatedEventArgs</code>	Provides data for the RowUpdated event. This class cannot be inherited.
<code> MySqlRowUpdatingEventArgs</code>	Provides data for the RowUpdating event. This class cannot be inherited.
<code> MySqlTransaction</code>	

Delegates

Delegate	Description
<code> MySqlInfoMessageEventHandler</code>	Represents the method that will handle the <code>InfoMessage</code> event of a <code>MySqlConnection</code> .
<code> MySqlRowUpdatedEventHandler</code>	Represents the method that will handle the RowUpdatedevent of a <code>MySqlDataAdapter</code> .
<code> MySqlRowUpdatingEventHandler</code>	Represents the method that will handle the RowUpdatingevent of a <code>MySqlDataAdapter</code> .

Enumerations

Enumeration	Description
<code> MySqlDbType</code>	Specifies MySQL specific data type of a field, property, for use in a <code> MySqlParameter</code> .
<code> MySqlErrorCode</code>

22.2.7.1.2.1. MySqlCommand Members

MySqlCommand overview

Public Instance Constructors

MySqlCommand	Overloaded. Initializes a new instance of the MySqlCommand class.
------------------------------	---

Public Instance Properties

CommandText	
CommandTimeout	
 CommandType	
Connection	
Container (inherited from Component)	Gets the IContainer that contains the Component.
IsPrepared	
Parameters	
Site (inherited from Component)	Gets or sets the ISite of the Component.
Transaction	
UpdatedRowSource	

Public Instance Methods

Cancel	Attempts to cancel the execution of a MySqlCommand. This operation is not supported.
CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote

	object.
CreateParameter	Creates a new instance of a MySqlParameter object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
ExecuteNonQuery	
ExecuteReader	Overloaded.
ExecuteScalar	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Prepare	
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
------------------------------------	---

[MySQLConnection overview](#)**Public Instance Constructors**

MySQLConnection	Overloaded. Initializes a new instance of the MySQLConnection class.
---------------------------------	--

Public Instance Properties

ConnectionString	
ConnectionTimeout	
Container (inherited from Component)	Gets the IContainer that contains the Component.
Database	
DataSource	Gets the name of the MySQL server to which to connect.
ServerThread	Returns the id of the server thread this connection is executing on
ServerVersion	
Site (inherited from Component)	Gets or sets the ISite of the Component.
State	
UseCompression	Indicates if this connection should use compression when communicating with the server.

Public Instance Methods

BeginTransaction	Overloaded.
ChangeDatabase	
Close	
CreateCommand	
CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Dispose (inherited from Component)	Releases all resources used by the Component.
Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType (inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService (inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Open	
Ping	Ping
ToString (inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed (inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
InfoMessage	
StateChange

[MySqlTransaction Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.1.3.1.1.10.1.1.1.1. Connection Property

Gets the [MySqlConnection](#) object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.

Syntax: Visual Basic

```
Public ReadOnly Property Connection As MySqlConnection
```

Syntax: C#

```
public MySqlConnection Connection {get;}
```

Property Value

The [MySqlConnection](#) object associated with this transaction.

Remarks

A single application may have multiple database connections, each with zero or more transactions. This property enables you to determine the connection object associated with a particular transaction created by [BeginTransaction](#) .

See Also

[MySqlTransaction Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.1.3.1.1.10.1.1.1.2. IsolationLevel Property

Specifies the IsolationLevelfor this transaction.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsolationLevel As IsolationLevel _
    Implements IDbTransaction.IsolationLevel
```

Syntax: C#

```
public System.Data.IsolationLevel IsolationLevel {get;}
```

Property Value

The IsolationLevel for this transaction. The default is ReadCommitted.

Implements

[IDbTransaction.IsolationLevel](#)

Remarks

Parallel transactions are not supported. Therefore, the IsolationLevel applies to the entire transaction.

Public Instance Constructors

 MySqlInfoMessageEventArgs Constructor	Initializes a new instance of the MySqlInfoMessageEventArgs class.
--	---

Public Instance Fields

 errors	
-------------------------	--

Public Instance Methods

 Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
 GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
 GetType(inherited from Object)	Gets the Type of the current instance.
 ToString(inherited from Object)	Returns a String that represents the current Object.

Protected Instance Methods

 Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
 MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

[MySqlParameterCollection](#) overview

Public Instance Constructors

MySqlParameterCollection Constructor	Initializes a new instance of the MySqlParameterCollection class.
--	---

Public Instance Properties

Count	Gets the number of MySqlParameter objects in the collection.
Item	Overloaded. Gets the MySqlParameter with a specified attribute. In C#, this property is the indexer for the MySqlParameterCollection class.

Public Instance Methods

Add	Overloaded. Adds the specified MySqlParameter object to the MySqlParameterCollection .
Clear	Removes all items from the collection.
Contains	Overloaded. Gets a value indicating whether a MySqlParameter exists in the collection.

CopyTo	Copies MySqlParameter objects from the MySqlParameterCollection to the specified array.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
IndexOf	Overloaded. Gets the location of a MySqlParameter in the collection.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Insert	Inserts a MySqlParameter into the collection at the specified index.
Remove	Removes the specified MySqlParameter from the collection.
RemoveAt	Overloaded. Removes the specified MySqlParameter from the collection.
ToString(inherited from Object)	Returns a String that represents the current Object.

See Also[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#)**22.2.7.1.2.1.7.1.1.1. MySqlParameterCollection Constructor**Initializes a new instance of the [MySqlParameterCollection](#) class.**Syntax: Visual Basic**

```

22.2.7.1.2.1.7.1.1.3. Item Property

Gets the [MySqlParameter](#) with a specified attribute. In C#, this property is the indexer for the [MySqlParameterCollection](#) class.

Overload List

Gets the [MySqlParameter](#) at the specified index.

- `public MySqlParameter this[int] {get; set;}`

Gets the [MySqlParameter](#) with the specified name.

- `public MySqlParameter this[string] {get; set;}`

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1. [MySqlParameter](#) Class

Represents a parameter to a [MySqlCommand](#), and optionally, its mapping to [DataSet](#) columns. This class cannot be inherited.

For a list of all members of this type, see [MySqlParameter Members](#).

Syntax: Visual Basic

```
NotInheritable Public Class MySqlParameter_
    Inherits MarshalByRefObject_
    Implements IDataParameter, IDbDataParameter, ICloneable
```

Syntax: C#

```
public sealed class MySqlParameter : MarshalByRefObject, IDataParameter, IDbDataParameter, ICloneable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: [MySql.Data](#) (in [MySql.Data.dll](#))

22.2.7.1.2.1.7.1.1.3.1.1. [MySqlParameter](#) Members

[MySqlParameter](#) overview

Public Instance Constructors

MySqlParameter	Overloaded. Initializes a new instance of the MySqlParameter class.
--------------------------------	---

Public Instance Properties

DbType	Gets or sets the DbType of the parameter.
Direction	Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return

	value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.
IsNullable	Gets or sets a value indicating whether the parameter accepts null values.
IsUnsigned	
MySqlDbType	Gets or sets the MySqlDbType of the parameter.
ParameterName	Gets or sets the name of the MySqlParameter.
Precision	Gets or sets the maximum number of digits used to represent the Value property.
Scale	Gets or sets the number of decimal places to which Value is resolved.
Size	Gets or sets the maximum size, in bytes, of the data within the column.
SourceColumn	Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the Value .
SourceVersion	Gets or sets the DataRowVersion to use when loading Value .
Value	Gets or sets the value of the parameter.

Public Instance Methods

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ToString	Overridden. Gets a string containing the ParameterName .

22.2.7.1.2.1.7.1.1.3.1.1.1. [MySqlParameter](#) Constructor

Initializes a new instance of the MySqlParameter class.

Overload List

Initializes a new instance of the MySqlParameter class.

- [public MySqlParameter\(\);](#)

Initializes a new instance of the [MySqlParameter](#) class with the parameter name and the data type.

- [public MySqlParameter\(string, MySqlDbType\);](#)

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the [MySqlDbType](#), and the size.

- [public MySqlParameter\(string, MySqlDbType, int\);](#)

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a ParameterDirection, the precision of the parameter, the scale of the parameter, the source column, a DataRowVersion to use, and the value of the parameter.

- `public MySqlParameter(string, MySqlDbType, int, ParameterDirection, bool, byte, byte, string, DataRowVersion, object);`

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the [MySqlDbType](#), the size, and the source column name.

- `public MySqlParameter(string, MySqlDbType, int, string);`

Initializes a new instance of the [MySqlParameter](#) class with the parameter name and a value of the new [MySqlParameter](#).

- `public MySqlParameter(string, object);`

22.2.7.1.2.1.7.1.1.3.1.1.1.2.1. [MySqlDbType](#) Enumeration

Specifies MySQL specific data type of a field, property, for use in a [MySqlParameter](#).

Syntax: Visual Basic

```
Public Enum MySqlDbType
```

Syntax: C#

```
public enum MySqlDbType
```

Members

Member Name	Description
Newdate	Obsolete. Use Datetime or Date type.
Timestamp	A timestamp. The range is '1970-01-01 00:00:01' to sometime in the year 2038.
Time	The range is '-838:59:59' to '838:59:59'
Date	Date The supported range is '1000-01-01' to '9999-12-31'
Datetime	The supported range is '1000-01-01 00:00:00' to '9999-12-31 23:59:59'
Year	A year in 2- or 4-digit format (default is 4-digit). The allowable values are 1901 to 2155, 0000 in the 4-digit year format, and 1970-2069 if you use the 2-digit format (70-69).
TinyBlob	A BLOB column with a maximum length of 255 ($2^8 - 1$) characters
Blob	A BLOB column with a maximum length of 65535 ($2^{16} - 1$) characters
MediumBlob	A BLOB column with a maximum length of 16777215 ($2^{24} - 1$) characters
LongBlob	A BLOB column with a maximum length of 4294967295 or 4G ($2^{32} - 1$) characters
Int16	A 16-bit signed integer. The signed range is -32768 to 32767. The unsigned range is 0 to 65535
Int24	Specifies a 24 (3 byte) signed or unsigned value
Int32	A 32-bit signed integer
Int64	A 64-bit signed integer
Byte	The signed range is -128 to 127. The unsigned range is 0 to 255.
Float	A small (single-precision) floating-point number. Allowable values are -3.402823466E+38 to -1.175494351E-38, 0, and 1.175494351E-38 to 3.402823466E+38.
Double	A normal-size (double-precision) floating-point number. Allowable values are -1.7976931348623157E+308 to -2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308.
UByte	An 8-bit unsigned value
UInt16	A 16-bit unsigned value
UInt24	A 24-bit unsigned value
UInt32	A 32-bit unsigned value
UInt64	A 64-bit unsigned value
Decimal	A fixed precision and scale numeric value between -1038 -1 and 10 38 -1

NewDecimal	New Decimal
Set	A set. A string object that can have zero or more values, each of which must be chosen from the list of values 'value1', 'value2', ... A SET can have a maximum of 64 members.
String	Obsolete Use VarChar type
VarChar	A variable-length string containing 0 to 255 characters
VarString	A variable-length string containing 0 to 65535 characters
Enum	An enumeration. A string object that can have only one value, chosen from the list of values 'value1', 'value2', ..., NULL or the special "" error value. An ENUM can have a maximum of 65535 distinct values.
Geometry	
Bit	Bit-field data type
TinyText	A nonbinary string column supporting a maximum length of 255 ($2^8 - 1$) characters
Text	A nonbinary string column supporting a maximum length of 65535 ($2^{16} - 1$) characters
MediumText	A nonbinary string column supporting a maximum length of 16777215 ($2^{24} - 1$) characters
LongText	A nonbinary string column supporting a maximum length of 4294967295 ($2^{32} - 1$) characters

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.1.3. [MySqlParameter](#) Constructor (String, MySqlDbType, Int32)

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the [MySqlDbType](#) , and the size.

Syntax: Visual Basic

```
Overloads Public Sub New(  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer _  
)
```

Syntax: C#

```
public MySqlParameter(  
    stringparameterName,  
    MySqlDbTypedbType,  
    intsize  
>;
```

Parameters

- [parameterName](#) : The name of the parameter to map.
- [dbType](#) : One of the [MySqlDbType](#) values.
- [size](#) : The length of the parameter.

[MySqlParameter Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameter Constructor Overload List](#)

22.2.7.1.2.1.7.1.1.3.1.1.1.4. MySqlParameter Constructor

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a ParameterDirection, the precision of the parameter, the scale of the parameter, the source column, a DataRowVersion to use, and the value of the parameter.

Syntax: Visual Basic

```
Overloads Public Sub New(
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer, _
    ByVal direction As ParameterDirection, _
    ByVal isNullable As Boolean, _
    ByVal precision As Byte, _
    ByVal scale As Byte, _
    ByVal sourceColumn As String, _
    ByVal sourceVersion As DataRowVersion, _
    ByVal value As Object _
)
```

Syntax: C#

```
public MySqlParameter(
    string parameterName,
    MySqlDbType dbType,
    int size,
    ParameterDirection direction,
    bool isNullable,
    byte precision,
    byte scale,
    string sourceColumn,
    DataRowVersion sourceVersion,
    object value
);
```

Parameters

- **parameterName**: The name of the parameter to map.
- **dbType**: One of the [MySqlDbType](#) values.
- **size**: The length of the parameter.
- **direction**: One of the [ParameterDirection](#) values.
- **isNullable**: true if the value of the field can be null, otherwise false.
- **precision**: The total number of digits to the left and right of the decimal point to which **Value** is resolved.
- **scale**: The total number of decimal places to which **Value** is resolved.
- **sourceColumn**: The name of the source column.
- **sourceVersion**: One of the [DataRowVersion](#) values.
- **value**: An [Object](#) that is the value of the [MySqlParameter](#).

Exceptions

Exception Type	Condition
ArgumentException

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameter Constructor Overload List](#)

22.2.7.1.2.1.7.1.1.3.1.1.1.4.1. Value Property

Gets or sets the value of the parameter.

Syntax: Visual Basic

```
NotOverridable Public Property Value As Object _
    Implements IDataParameter.Value
```

Syntax: C#

```
public object Value {get; set;}
```

Implements

IDataParameter.Value

See Also[MySqlParameter Class, MySql.Data.MySqlClient Namespace](#)**22.2.7.1.2.1.7.1.1.3.1.1.1.5. MySqlParameter Constructor**

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the [MySqlDbType](#), the size, and the source column name.

Syntax: Visual Basic

```
Overloads Public Sub New(
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer, _
    ByVal sourceColumn As String _
)
```

Syntax: C#

```
public MySqlParameter(
    stringparameterName,
    MySqlDbTypedbType,
    intsize,
    stringsourceColumn
);
```

Parameters

- parameterName:** The name of the parameter to map.
- dbType:** One of the [MySqlDbType](#) values.
- size:** The length of the parameter.
- sourceColumn:** The name of the source column.

See Also[MySqlParameter Class, MySql.Data.MySqlClient Namespace, MySqlParameter Constructor Overload List](#)**22.2.7.1.2.1.7.1.1.3.1.1.1.6. MySqlParameter Constructor**

Initializes a new instance of the [MySqlParameter](#) class with the parameter name and a value of the new [MySqlParameter](#).

Syntax: Visual Basic

```
Overloads Public Sub New(
    ByVal parameterName As String, _
    ByVal value As Object _
)
```

Syntax: C#

```
public MySqlParameter(
    stringparameterName,
    objectvalue
);
```

Parameters

- **parameterName**: The name of the parameter to map.
- **value**: An Objectthat is the value of the [MySqlParameter](#) .

22.2.7.1.2.1.7.1.1.3.1.1.2. DbType Property

Gets or sets the DbTypeof the parameter.

Syntax: Visual Basic

```
NotOverridable Public Property DbType As DbType  
  Implements IDataParameter.DbType
```

Syntax: C#

```
public System.Data.DbType DbType {get; set;}
```

Implements

IDataParameter.DbType

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.3. Direction Property

Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.

Syntax: Visual Basic

```
NotOverridable Public Property Direction As ParameterDirection  
  Implements IDataParameter.Direction
```

Syntax: C#

```
public System.Data.ParameterDirection Direction {get; set;}
```

Implements

IDataParameter.Direction

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.4. IsNullable Property

Gets or sets a value indicating whether the parameter accepts null values.

Syntax: Visual Basic

```
NotOverridable Public Property IsNullable As Boolean  
  Implements IDataParameter.IsNullable
```

Syntax: C#

```
public bool IsNullable {get; set;}
```

Implements

IDataParameter.IsDBNull

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.5. IsUnsigned Property

Syntax: Visual Basic

```
Public Property IsUnsigned As Boolean
```

Syntax: C#

```
public bool IsUnsigned {get; set;}
```

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.6. MySqlDbType Property

Gets or sets the MySqlDbType of the parameter.

Syntax: Visual Basic

```
Public Property MySqlDbType As MySqlDbType
```

Syntax: C#

```
public MySqlDbType MySqlDbType {get; set;}
```

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.7. ParameterName Property

Gets or sets the name of the MySqlParameter.

Syntax: Visual Basic

```
NotOverridable Public Property ParameterName As String  
  Implements IDataParameter.ParameterName
```

Syntax: C#

```
public string ParameterName {get; set;}
```

Implements

IDataParameter.ParameterName

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.8. Precision Property

Gets or sets the maximum number of digits used to represent the [Value](#) property.

Syntax: Visual Basic

```
NotOverridable Public Property Precision As Byte  
  Implements IDbDataParameter.Precision
```

Syntax: C#

```
public byte Precision {get; set;}
```

Implements

IDbDataParameter.Precision

See Also[MySqlParameter Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.9. Scale Property

Gets or sets the number of decimal places to which [Value](#) is resolved.

Syntax: Visual Basic

```
NotOverridable Public Property Scale As Byte _  
    Implements IDbDataParameter.Scale
```

Syntax: C#

```
public byte Scale {get; set;}
```

Implements

IDbDataParameter.Scale

See Also[MySqlParameter Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.10. Size Property

Gets or sets the maximum size, in bytes, of the data within the column.

Syntax: Visual Basic

```
NotOverridable Public Property Size As Integer _  
    Implements IDbDataParameter.Size
```

Syntax: C#

```
public int Size {get; set;}
```

Implements

IDbDataParameter.Size

See Also[MySqlParameter Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.11. SourceColumn Property

Gets or sets the name of the source column that is mapped to the DataSet used for loading or returning the [Value](#).

Syntax: Visual Basic

```
NotOverridable Public Property SourceColumn As String _  
    Implements IDataParameter.SourceColumn
```

Syntax: C#

```
public string SourceColumn {get; set;}
```

Implements

IDataParameter.SourceColumn

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.12. SourceVersion Property

Gets or sets the DataRowVersion to use when loading [Value](#).

Syntax: Visual Basic

```
NotOverridable Public Property SourceVersion As DataRowVersion _  
    Implements IDataParameter.SourceVersion
```

Syntax: C#

```
public System.Data.DataRowVersion SourceVersion {get; set;}
```

Implements

IDataParameter.SourceVersion

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.1.1.13. [MySqlParameter.ToString](#) Method

Overridden. Gets a string containing the [ParameterName](#).

Syntax: Visual Basic

```
Overrides Public Function ToString() As String
```

Syntax: C#

```
public override string ToString();
```

Return Value

See Also

[MySqlParameter Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.3.2. Item Property (Int32)

Gets the [MySqlParameter](#) at the specified index.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _  
    ByVal index As Integer _  
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter this[  
    int index  
] {get; set;}
```

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Item Overload List](#)

22.2.7.1.2.1.7.1.1.3.3. Item Property (String)

Gets the [MySqlParameter](#) with the specified name.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _
    ByVal name As String _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter this[  
    stringname  
] {get; set;}
```

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace, MySqlParameterCollection.Item Overload List](#)

22.2.7.1.2.1.7.1.1.4. Add Method

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#).

Overload List

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#).

- [public MySqlParameter Add\(MySqlParameter\);](#)

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#).

- [public int Add\(object\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the parameter name and the data type.

- [public MySqlParameter Add\(string,MySqlDbType\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, and the column length.

- [public MySqlParameter Add\(string,MySqlDbType,int\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

- [public MySqlParameter Add\(string,MySqlDbType,int,string\);](#)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the specified parameter name and value.

- [public MySqlParameter Add\(string,objeCt\);](#)

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.4.1. [MySqlParameterCollection.Add](#) Method

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#).

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal value As MySqlParameter _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(
    MySqlParameter value
);
```

Parameters

- **value**: The [MySqlParameter](#) to add to the collection.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Add Overload List](#)

22.2.7.1.2.1.7.1.1.4.2. [MySqlParameterCollection.Add](#) Method

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#).

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Add( _
    ByVal value As Object _
) As Integer _
    Implements IList.Add
```

Syntax: C#

```
public int Add(
    object value
);
```

Parameters

- **value**: The [MySqlParameter](#) to add to the collection.

Return Value

The index of the new [MySqlParameter](#) object.

Implements

IList.Add

See Also

[MySqlParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Add Overload List](#)

22.2.7.1.2.1.7.1.1.4.3. [MySqlParameterCollection.Add](#) Method

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the parameter name and the data type.

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(
    string parameterName,
    MySqlDbType dbType
);
```

Parameters

- `parameterName`: The name of the parameter.
- `dbType`: One of the [MySqlDbType](#) values.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Add Overload List](#)

22.2.7.1.2.1.7.1.1.4.4. [MySqlParameterCollection.Add](#) Method

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, and the column length.

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(
    string parameterName,
    MySqlDbType dbType,
    int size
);
```

Parameters

- `parameterName`: The name of the parameter.
- `dbType`: One of the [MySqlDbType](#) values.
- `size`: The length of the column.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Add Overload List](#)

22.2.7.1.2.1.7.1.1.4.5. [MySqlParameterCollection.Add](#) Method

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer, _
    ByVal sourceColumn As String _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(
    string parameterName,
    MySqlDbType dbType,
    int size,
    string sourceColumn
);
```

Parameters

- `parameterName`: The name of the parameter.
- `dbType`: One of the [MySqlDbType](#) values.
- `size`: The length of the column.
- `sourceColumn`: The name of the source column.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Add Overload List](#)

22.2.7.1.2.1.7.1.1.4.6. [MySqlParameterCollection.Add](#) Method

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the specified parameter name and value.

Syntax: Visual Basic

```
Overloads Public Function Add( _
    ByVal parameterName As String, _
    ByVal value As Object _
) As MySqlParameter
```

Syntax: C#

```
public MySqlParameter Add(
    string parameterName,
    object value
);
```

Parameters

- `parameterName`: The name of the parameter.
- `value`: The [Value](#) of the [MySqlParameter](#) to add to the collection.

Return Value

The newly added [MySqlParameter](#) object.

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Add Overload List](#)

22.2.7.1.2.1.7.1.1.5. [MySqlParameterCollection.Clear](#) Method

Removes all items from the collection.

Syntax: Visual Basic

```
NotOverridable Public Sub Clear() _
    Implements IList.Clear
```

Syntax: C#

```
public void Clear();
```

Implements

[IList.Clear](#)

See Also

[MySqlParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.6. Contains Method

Gets a value indicating whether a [MySqlParameter](#) exists in the collection.

Overload List

Gets a value indicating whether a MySqlParameter exists in the collection.

- [public bool Contains\(object\);](#)

Gets a value indicating whether a [MySqlParameter](#) with the specified parameter name exists in the collection.

- [public bool Contains\(string\);](#)

See Also

[MySqlParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.6.1. [MySqlParameterCollection.Contains](#) Method

Gets a value indicating whether a MySqlParameter exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _
    ByVal value As Object _
) As Boolean _
    Implements IList.Contains
```

Syntax: C#

```
public bool Contains(
    object value
);
```

Parameters

- [value](#): The value of the [MySqlParameter](#) object to find.

Return Value

true if the collection contains the [MySqlParameter](#) object; otherwise, false.

Implements

IList.Contains

See Also

[MySqlParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Contains Overload List](#)

22.2.7.1.2.1.7.1.1.6.2. [MySqlParameterCollection.Contains](#) Method

Gets a value indicating whether a [MySqlParameter](#) with the specified parameter name exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _
    ByVal name As String _
) As Boolean _
    Implements IDataParameterCollection.Contains
```

Syntax: C#

```
public bool Contains(  
    stringname  
) ;
```

Parameters

- **name:** The name of the [MySqlParameter](#) object to find.

Return Value

true if the collection contains the parameter; otherwise, false.

Implements

[IDataParameterCollection](#).Contains

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameterCollection.Contains Overload List](#)

22.2.7.1.2.1.7.1.1.7. [MySqlParameterCollection.CopyTo](#) Method

Copies [MySqlParameter](#) objects from the [MySqlParameterCollection](#) to the specified array.

Syntax: Visual Basic

```
NotOverridable Public Sub CopyTo( _  
    ByVal array As Array, _  
    ByVal index As Integer _  
) _  
- Implements ICollection.CopyTo
```

Syntax: C#

```
public void CopyTo(  
    Arrayarray,  
    intindex  
) ;
```

Parameters

- **array:**
- **index:**

Implements

[ICollection](#).CopyTo

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.8. [IndexOf](#) Method

Gets the location of a [MySqlParameter](#) in the collection.

Overload List

Gets the location of a [MySqlParameter](#) in the collection.

- **public int IndexOf(object);**

Gets the location of the [MySqlParameter](#) in the collection with a specific parameter name.

- `public int IndexOf(string);`

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.8.1. `MySqlParameterCollection.IndexOf` Method

Gets the location of a [MySqlParameter](#) in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _
    ByVal value As Object _
) As Integer _
- Implements IList.IndexOf
```

Syntax: C#

```
public int IndexOf(
    objectvalue
);
```

Parameters

- `value`: The [MySqlParameter](#) object to locate.

Return Value

The zero-based location of the [MySqlParameter](#) in the collection.

Implements

IList.IndexOf

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace, MySqlParameterCollection.IndexOf Overload List](#)

22.2.7.1.2.1.7.1.1.8.2. `MySqlParameterCollection.IndexOf` Method

Gets the location of the [MySqlParameter](#) in the collection with a specific parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _
    ByVal parameterName As String _
) As Integer _
- Implements IDataParameterCollection.IndexOf
```

Syntax: C#

```
public int IndexOf(
    stringparameterName
);
```

Parameters

- `parameterName`: The name of the [MySqlParameter](#) object to retrieve.

Return Value

The zero-based location of the [MySqlParameter](#) in the collection.

Implements

[IDataParameterCollection.IndexOf](#)

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace, MySqlParameterCollection.IndexOf Overload List](#)

22.2.7.1.2.1.7.1.1.9. `MySqlParameterCollection.Insert` Method

Inserts a MySqlParameter into the collection at the specified index.

Syntax: Visual Basic

```
NotOverridable Public Sub Insert( _
    ByVal index As Integer, _
    ByVal value As Object _
) _
- Implements IList.Insert
```

Syntax: C#

```
public void Insert(
    int index,
    object value
);
```

Parameters

- `index`:
- `value`:

Implements

IList.Insert

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.10. `MySqlParameterCollection.Remove` Method

Removes the specified MySqlParameter from the collection.

Syntax: Visual Basic

```
NotOverridable Public Sub Remove( _
    ByVal value As Object _
) _
- Implements IList.Remove
```

Syntax: C#

```
public void Remove(
    object value
);
```

Parameters

- `value`:

Implements

IList.Remove

See Also

[MySqlParameterCollection Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.11. RemoveAt Method

Removes the specified [MySqlParameter](#) from the collection.

Overload List

Removes the specified [MySqlParameter](#) from the collection using a specific index.

- [public void RemoveAt\(int\);](#)

Removes the specified [MySqlParameter](#) from the collection using the parameter name.

- [public void RemoveAt\(string\);](#)

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.7.1.1.11.1. [MySqlParameterCollection.RemoveAt](#) Method

Removes the specified [MySqlParameter](#) from the collection using a specific index.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _
    ByVal index As Integer _
) _
- Implements IList.RemoveAt
```

Syntax: C#

```
public void RemoveAt(
    int index
);
```

Parameters

- **index:** The zero-based index of the parameter.

Implements

IList.RemoveAt

See Also

[MySqlParameterCollection Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlParameterCollection.RemoveAt Overload List](#)

22.2.7.1.2.1.7.1.1.11.2. [MySqlParameterCollection.RemoveAt](#) Method

Removes the specified [MySqlParameter](#) from the collection using the parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _
    ByVal name As String _
) _
- Implements IDataParameterCollection.RemoveAt
```

Syntax: C#

```
public void RemoveAt(
    string name
);
```

Parameters

- **name:** The name of the [MySqlParameter](#) object to retrieve.

Implements

IDataParameterCollection.RemoveAt

See Also[MySqlParameterCollection Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySqlParameterCollection.RemoveAt Overload List](#)**22.2.7.1.2.1.8. Transaction Property****Syntax: Visual Basic**

```
Public Property Transaction As MySqlTransaction
```

Syntax: C#

```
public MySqlTransaction Transaction {get; set;}
```

See Also [MySqlCommand Class](#), [MySQL.Data.MySqlClient Namespace](#)**22.2.7.1.2.1.9. UpdatedRowSource Property****Syntax: Visual Basic**

```
NotOverridable Public Property UpdatedRowSource As UpdateRowSource _
- Implements IDbCommand.UpdatedRowSource
```

Syntax: C#

```
public System.Data.UpdateRowSource UpdatedRowSource {get; set;}
```

Implements

IDbCommand.UpdatedRowSource

See Also [MySqlCommand Class](#), [MySQL.Data.MySqlClient Namespace](#)**22.2.7.1.2.1.10. [MySqlCommand.Cancel](#) Method**

Attempts to cancel the execution of a MySqlCommand. This operation is not supported.

Syntax: Visual Basic

```
NotOverridable Public Sub Cancel() _
- Implements IDbCommand.Cancel
```

Syntax: C#

```
public void Cancel();
```

Implements

IDbCommand.Cancel

Remarks

Cancelling an executing command is currently not supported on any version of MySQL.

Exceptions

Exception Type	Condition
----------------	-----------

NotSupportedException	This operation is not supported.
-----------------------	----------------------------------

See Also

[MySqlCommand Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.11. `MySqlCommand.CreateParameter` Method

Creates a new instance of a [MySqlParameter](#) object.

Syntax: Visual Basic

```
Public Function CreateParameter() As MySqlParameter
```

Syntax: C#

```
public MySqlParameter CreateParameter();
```

Return Value

A [MySqlParameter](#) object.

Remarks

This method is a strongly-typed version of `CreateParameter`.

See Also

[MySqlCommand Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.12. `MySqlCommand.ExecuteNonQuery` Method**Syntax: Visual Basic**

```
NotOverridable Public Function ExecuteNonQuery() As Integer _
    Implements IDbCommand.ExecuteNonQuery
```

Syntax: C#

```
public int ExecuteNonQuery();
```

Implements

`IDbCommand.ExecuteNonQuery`

See Also

[MySqlCommand Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13. `ExecuteReader` Method**Overload List**

- `public MySqlDataReader ExecuteReader();`
- `public MySqlDataReader ExecuteReader(CommandBehavior);`

See Also

[MySqlCommand Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1. `MySqlCommand.ExecuteReader` Method**Syntax: Visual Basic**

```
Overloads Public Function ExecuteReader() As MySqlDataReader
```

Syntax: C#

```
public MySqlDataReader ExecuteReader();
```

See Also

[MySqlCommand Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlCommand.ExecuteReader Overload List](#)

22.2.7.1.2.1.13.1.1. MySqlDataReader Class

Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.

For a list of all members of this type, see [MySqlDataReader Members](#).

Syntax: Visual Basic

```
NotInheritable Public Class MySqlDataReader_
    Inherits MarshalByRefObject_
    Implements IEnumerable, IDataReader, IDisposable, IDataRecord
```

Syntax: C#

```
public sealed class MySqlDataReader : MarshalByRefObject, IEnumerable, IDataReader, IDisposable, IDataRecord
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlDataReader Members](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1. MySqlDataReader Members[MySqlDataReader overview](#)**Public Instance Properties**

Depth	Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.
FieldCount	Gets the number of columns in the current row.
HasRows	Gets a value indicating whether the MySqlDataReader contains one or more rows.
IsClosed	Gets a value indicating whether the data reader is closed.
Item	Overloaded. Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySqlDataReader class.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Public Instance Methods

Close	Closes the MySqlDataReader object.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.

GetBoolean	Gets the value of the specified column as a Boolean.
GetByte	Gets the value of the specified column as a byte.
GetBytes	Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.
GetChar	Gets the value of the specified column as a single character.
GetChars	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.
GetDataTypeName	Gets the name of the source data type.
GetDateTime	
GetDecimal	
GetDouble	
GetFieldType	Gets the Type that is the data type of the object.
GetFloat	
GetGuid	
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetInt16	
GetInt32	
GetInt64	
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetMySqlDateTime	
GetName	Gets the name of the specified column.
GetOrdinal	Gets the column ordinal, given the name of the column.
GetSchemaTable	Returns a DataTable that describes the column metadata of the MySqlDataReader.
GetString	
GetTimeSpan	
GetType (inherited from Object)	Gets the Type of the current instance.
GetUInt16	
GetUInt32	
GetUInt64	
GetValue	Gets the value of the specified column in its native format.
GetValues	Gets all attribute columns in the collection for the current row.
InitializeLifetimeService (inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
IsDBNull	Gets a value indicating whether the column contains non-existent or missing values.
NextResult	Advances the data reader to the next result, when reading the results of batch SQL statements.
Read	Advances the MySqlDataReader to the next record.
ToString (inherited from Object)	Returns a String that represents the current Object.

22.2.7.1.2.1.13.1.1.1. Depth Property

Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property Depth As Integer _  
    Implements IDataReader.Depth
```

Syntax: C#

```
public int Depth {get;}
```

Implements

IDataReader.Depth

See Also

[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.2. FieldCount Property

Gets the number of columns in the current row.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property FieldCount As Integer _  
    Implements IDataRecord.FieldCount
```

Syntax: C#

```
public int FieldCount {get;}
```

Implements

IDataRecord.FieldCount

See Also

[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.3. HasRows Property

Gets a value indicating whether the MySqlDataReader contains one or more rows.

Syntax: Visual Basic

```
Public ReadOnly Property HasRows As Boolean
```

Syntax: C#

```
public bool HasRows {get;}
```

See Also

[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.4. IsClosed Property

Gets a value indicating whether the data reader is closed.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsClosed As Boolean _  
    Implements IDataReader.IsClosed
```

Syntax: C#

```
public bool IsClosed {get;}
```

Implements

[IDataReader.IsClosed](#)

See Also

[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.5. Item Property

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySqlDataReader class.

Overload List

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySqlDataReader class.

- [public object this\[int\] {get;}](#)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySqlDataReader class.

- [public object this\[string\] {get;}](#)

See Also

[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.5.1. Item Property (Int32)

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySqlDataReader class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _
    ByVal i As Integer _
) _
Implements IDataRecord.Item As Object _
Implements IDataRecord.Item
```

Syntax: C#

```
public object this[_
    inti
] {get;}
```

Implements

[IDataRecord.Item](#)

See Also

22.2.7.1.2.1.13.1.1.1.5.2. Item Property (String)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySqlDataReader class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _
    ByVal name As String _
) _
Implements IDataRecord.Item As Object _
Implements IDataRecord.Item
```

Syntax: C#

```
public object this[_
    stringname
] {get;}
```

Implements

IDataRecord.Item

See Also[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlDataReader.Item Overload List](#)

22.2.7.1.2.1.13.1.1.1.6. RecordsAffected Property

Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property RecordsAffected As Integer _  
    Implements IDataReader.RecordsAffected
```

Syntax: C#

```
public int RecordsAffected {get;}
```

Implements

IDataReader.RecordsAffected

See Also[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.7. [MySqlDataReader.Close](#) Method

Closes the MySqlDataReader object.

Syntax: Visual Basic

```
NotOverridable Public Sub Close() _  
    Implements IDataReader.Close
```

Syntax: C#

```
public void Close();
```

Implements

IDataReader.Close

See Also[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.8. [MySqlDataReader.GetBoolean](#) Method

Gets the value of the specified column as a Boolean.

Syntax: Visual Basic

```
NotOverridable Public Function GetBoolean( _  
    ByVal i As Integer _  
) As Boolean _  
    Implements IDataRecord.GetBoolean
```

Syntax: C#

```
public bool GetBoolean(  
    int i  
>;
```

Parameters

- [i:](#)

Return Value**Implements**

IDataRecord.GetBoolean

See Also[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)**22.2.7.1.2.1.13.1.1.1.9. MySqlDataReader .GetByte Method**

Gets the value of the specified column as a byte.

Syntax: Visual Basic

```
NotOverridable Public Function GetByte( _
    ByVal i As Integer _ 
) As Byte _ 
    Implements IDataRecord.GetByte
```

Syntax: C#

```
public byte GetByte(
    int i
);
```

Parameters

- [i:](#)

Return Value**Implements**

IDataRecord.GetByte

See Also[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)**22.2.7.1.2.1.13.1.1.1.10. MySqlDataReader .GetBytes Method**

Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetBytes( _
    ByVal i As Integer, _
    ByVal dataIndex As Long, _
    ByVal buffer As Byte(), _
    ByVal bufferIndex As Integer, _
    ByVal length As Integer _ 
) As Long _ 
    Implements IDataRecord.GetBytes
```

Syntax: C#

```
public long GetBytes(
    int i,
    long dataIndex,
    byte[] buffer,
    int bufferIndex,
    int length
);
```

Parameters

- **i:** The zero-based column ordinal.
- **dataIndex:** The index within the field from which to begin the read operation.
- **buffer:** The buffer into which to read the stream of bytes.
- **bufferIndex:** The index for buffer to begin the read operation.
- **length:** The maximum length to copy into the buffer.

Return Value

The actual number of bytes read.

Implements

IDataRecord.GetBytes

[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.11. MySqlDataReader .GetChar Method

Gets the value of the specified column as a single character.

Syntax: Visual Basic

```
NotOverridable Public Function GetChar( _
    ByVal i As Integer _ 
) As Char _ 
- Implements IDataRecord.GetChar
```

Syntax: C#

```
public char GetChar(
    int i
);
```

Parameters

- **i:**

Return Value**Implements**

IDataRecord.GetChar

See Also

[MySqlDataReader Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.2.1.13.1.1.1.12. MySqlDataReader .GetChars Method

Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetChars( _
    ByVal i As Integer, _
    ByVal fieldOffset As Long, _
    ByVal buffer As Char(), _
    ByVal bufferoffset As Integer, _
    ByVal length As Integer _ 
) As Long _ 
- Implements IDataRecord.GetChars
```

Syntax: C#

```
public long GetChars(
    int i,
    long fieldOffset,
    char[] buffer,
    int bufferOffset,
    int length
);
```

Parameters

- `i`:
- `fieldOffset`:
- `buffer`:
- `bufferoffset`:
- `length`:

Return Value**Implements**

IDataRecord.GetChars

See Also[MySqlDataReader Class, MySql.Data.MySqlClient Namespace](#)**22.2.7.1.2.1.13.1.1.1.13. `MySqlDataReader`.`GetDataTypeName` Method**

Gets the name of the source data type.

Syntax: Visual Basic

```
NotOverridable Public Function GetDataTypeName( _
    ByVal i As Integer _ 
) As String _ 
    Implements IDataRecord.GetDataTypeName
```

Syntax: C#

```
public string GetDataTypeName(
    int i
);
```

Parameters

- `i`:

22.2.7.1.3. MySqlCommandBuilder Class

For a list of all members of this type, see [MySqlCommandBuilder Members](#).

Syntax: Visual Basic

```
NotInheritable Public Class MySqlCommandBuilder_
    Inherits Component
```

Syntax: C#

```
public sealed class MySqlCommandBuilder : Component
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlCommandBuilder Members](#), [MySQL.Data.MySqlClient Namespace](#)

22.2.7.1.3.1. MySqlCommandBuilder Members

[MySqlCommandBuilder overview](#)

Public Static (Shared) Methods

DeriveParameters	Overloaded. Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.
----------------------------------	--

Public Instance Constructors

MySqlCommandBuilder	Overloaded. Initializes a new instance of the MySqlCommandBuilder class.
-------------------------------------	--

Public Instance Properties

Container (inherited from Component)	Gets the IContainer that contains the Component.
DataAdapter	
QuotePrefix	
QuoteSuffix	
Site (inherited from Component)	Gets or sets the ISite of the Component.

Public Instance Methods

CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Dispose (inherited from Component)	Releases all resources used by the Component.
Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetDeleteCommand	
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetInsertCommand	
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType (inherited from Object)	Gets the Type of the current instance.
GetUpdateCommand	
InitializeLifetimeService (inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
RefreshSchema	
ToString (inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed (inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
---	---

[MySQLCommandBuilder Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.3.1.1.1. `MySQLCommandBuilder.DeriveParameters` Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySql.

Syntax: Visual Basic

```
Overloads Public Shared Sub DeriveParameters( _
    ByVal command As MySqlCommand _)
)
```

Syntax: C#

```
public static void DeriveParameters(
MySqlCommand command
);
```

Parameters

- `command`: The MySqlCommand referencing the stored procedure from which the parameter information is to be derived. The derived parameters are added to the Parameters collection of the MySqlCommand.

Exceptions

Exception Type	Condition
<code>InvalidOperationException</code>	The command text is not a valid stored procedure name.

[MySqlDataAdapter Members](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.3.1.2.2.1.1. MySqlDataAdapter Members[MySqlDataAdapter overview](#)**Public Instance Constructors**

MySqlDataAdapter	Overloaded. Initializes a new instance of the MySqlDataAdapter class.
----------------------------------	---

Public Instance Properties

AcceptChangesDuringFill (inherited from DataAdapter)	Gets or sets a value indicating whether AcceptChanges is called on a DataRow after it is added to the DataTable during any of the Fill operations.
AcceptChangesDuringUpdate (inherited from DataAdapter)	Gets or sets whether AcceptChanges is called during a Update.
Container (inherited from Component)	Gets the IContainer that contains the Component.
ContinueUpdateOnError (inherited from DataAdapter)	Gets or sets a value that specifies whether to generate an exception when an error is encountered during a row update.
DeleteCommand	Overloaded.
FillLoadOption (inherited from DataAdapter)	Gets or sets the LoadOption that determines how the adapter fills the DataTable from the DbDataReader.
InsertCommand	Overloaded.
MissingMappingAction (inherited from DataAdapter)	Determines the action to take when incoming data does not have a matching table or column.
MissingSchemaAction (inherited from DataAdapter)	Determines the action to take when existing DataSet schema does not match incoming data.
ReturnProviderSpecificTypes (inherited from DataAdapter)	Gets or sets whether the Fill method should return provider-specific values or common CLS-compliant values.
SelectCommand	Overloaded.
Site (inherited from Component)	Gets or sets the ISite of the Component.
TableMappings (inherited from DataAdapter)	Gets a collection that provides the master mapping between a source table and a DataTable.
UpdateBatchSize (inherited from DbDataAdapter)	Gets or sets a value that enables or disables batch processing support, and specifies the number of commands that can be executed in a batch.
UpdateCommand	Overloaded.

Public Instance Methods

CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
--	---

Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
Fill(inherited from DbDataAdapter)	Overloaded. Adds or refreshes rows in the DataSet to match those in the data source using the DataSetName, and creates a DataTable named "Table."
FillSchema(inherited from DbDataAdapter)	Overloaded. Configures the schema of the specified DataTable-based on the specified SchemaType.
GetFillParameters(inherited from DbDataAdapter)	Gets the parameters set by the user when executing an SQL SELECT statement.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ResetFillLoadOption(inherited from DataAdapter)	Resets FillLoadOption to its default state and causes Fill to honor AcceptChangesDuringFill.
ShouldSerializeAcceptChangesDuringFill(inherited from DataAdapter)	Determines whether the AcceptChangesDuringFill property should be persisted.
ShouldSerializeFillLoadOption(inherited from DataAdapter)	Determines whether the FillLoadOption property should be persisted.
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.
Update(inherited from DbDataAdapter)	Overloaded. Calls the respective INSERT, UPDATE, or DELETE statements for each inserted, updated, or deleted row in the specified DataSet.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
FillError(inherited from DataAdapter)	Returned when an error occurs during a fill operation.
RowUpdated	Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.
RowUpdating	Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

Protected Internal Instance Properties

FillCommandBehavior(inherited from DbDataAdapter)	Gets or sets the behavior of the command used to fill the data adapter.
---	---

22.2.7.1.3.1.2.2.1.1.6. `MySqlDataAdapter.RowUpdated` Event

Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdated As MySqlRowUpdatedEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatedEventHandler RowUpdated;
```

Event Data

The event handler receives an argument of type `MySqlRowUpdatedEventArgs` containing data related to this event. The following `MySqlRowUpdatedEventArgs` properties provide information specific to this event.

Property	Description
<code>Command</code>	Gets or sets the MySqlCommand executed when Update is called.
<code>Errors</code>	Gets any errors generated by the .NET Framework data provider when the Command was executed.
<code>RecordsAffected</code>	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
<code>Row</code>	Gets the DataRows sent through an Update.
<code>RowCount</code>	Gets the number of rows processed in a batch of updated records.
<code>StatementType</code>	Gets the type of SQL statement executed.
<code>Status</code>	Gets the UpdateStatus of the Command property.
<code>TableMapping</code>	Gets the DataTableMappings sent through an Update.

Public Instance Constructors

 MySqlRowUpdatedEventArgs Constructor	Initializes a new instance of the MySqlRowUpdatedEventArgs class.
---	---

Public Instance Properties

 Command	Overloaded. Gets or sets the MySqlCommand executed when Update is called.
 Errors (inherited from RowUpdatedEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command was executed.
 RecordsAffected (inherited from RowUpdatedEventArgs)	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
 Row (inherited from RowUpdatedEventArgs)	Gets the DataRows sent through an Update.
 RowCount (inherited from RowUpdatedEventArgs)	Gets the number of rows processed in a batch of updated records.
 StatementType (inherited from RowUpdatedEventArgs)	Gets the type of SQL statement executed.
 Status (inherited from RowUpdatedEventArgs)	Gets the UpdateStatus of the Command property.
 TableMapping (inherited from RowUpdatedEventArgs)	Gets the DataTableMappings sent through an Update.

Public Instance Methods

 CopyToRows (inherited from RowUpdatedEventArgs)	Overloaded. Copies references to the modified rows into the provided array.
 Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
 GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
 GetType (inherited from Object)	Gets the Type of the current instance.
 ToString (inherited from Object)	Returns a String that represents the current Object.

22.2.7.1.3.1.2.2.1.1.6.1.1.1.1. `MySqlRowUpdatedEventArgs` Constructor

Initializes a new instance of the `MySqlRowUpdatedEventArgs` class.

Syntax: Visual Basic

```
Public Sub New( _  
    ByVal row As DataRow, _  
    ByVal command As IDbCommand, _  
    ByVal statementType As StatementType, _  
    ByVal tableMapping As DataTableMapping _  
)
```

Syntax: C#

```
public MySqlRowUpdatedEventArgs(  
    DataRow row,  
    IDbCommand command,  
    StatementType statementType,  
    DataTableMapping tableMapping  
) ;
```

Parameters

- `row`: The `DataRow` sent through an `Update`.
- `command`: The `IDbCommand` executed when `Update` is called.
- `statementType`: One of the `StatementType` values that specifies the type of query executed.
- `tableMapping`: The `DataTableMapping` sent through an `Update`.

22.2.7.1.3.1.2.2.1.1.7. `MySqlDataAdapter.RowUpdating` Event

Occurs during `Update` before a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdating As MySqlRowUpdatingEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatingEventHandler RowUpdating;
```

Event Data

The event handler receives an argument of type [MySqlRowUpdatingEventArgs](#) containing data related to this event. The following [MySqlRowUpdatingEventArgs](#) properties provide information specific to this event.

Property	Description
Command	Gets or sets the MySqlCommand to execute when performing the Update.
Errors	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType	Gets the type of SQL statement to execute.
Status	Gets or sets the UpdateStatus of the Command property.
TableMapping	Gets the DataTableMapping to send through the Update.

22.2.7.1.3.1.2.2.1.1.7.1.1.1.1. [MySqlRowUpdatingEventArgs](#) Constructor

Initializes a new instance of the MySqlRowUpdatingEventArgs class.

Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

Syntax: C#

```
public MySqlRowUpdatingEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

Parameters

- **row**: The DataRow to Update.
- **command**: The IDbCommand to execute during Update.
- **statementType**: One of the StatementType values that specifies the type of query executed.
- **tableMapping**: The DataTableMappings sent through an Update.

22.2.7.1.4. `MySQLException` Class

The exception that is thrown when MySQL returns an error. This class cannot be inherited.

For a list of all members of this type, see [MySQLException Members](#).

Syntax: Visual Basic

```
NotInheritable Public Class MySqlException_
    Inherits SystemException
```

Syntax: C#

```
public sealed class MySqlException : SystemException
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLException Members](#), [MySQL.Data.MySqlClient Namespace](#)

22.2.7.1.4.1. `MySQLException` Members

[MySQLException](#) overview

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.

Message(inherited from Exception)	Gets a message that describes the current exception.
Number	Gets a number that identifies the type of error. This number corresponds to the error numbers given in Section C.3, “Server Error Codes and Messages” .
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

[MySqlHelper overview](#)

Public Static (Shared) Methods

 ExecuteDataRow	Executes a single SQL statement and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.
 ExecuteDataset	Overloaded. Executes a single SQL statement and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.
 ExecuteNonQuery	Overloaded. Executes a single command against a MySQL database. The MySqlConnection is assumed to be open when the method is called and remains open after the method completes.
 ExecuteReader	Overloaded. Executes a single command against a MySQL database.
 ExecuteScalar	Overloaded. Execute a single command against a MySQL database.
 UpdateDataSet	Updates the given table with data from the given DataSet

Public Instance Methods

 Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
 GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
 GetType(inherited from Object)	Gets the Type of the current instance.
 ToString(inherited from Object)	Returns a String that represents the current Object.

22.2.7.1.5.1.1. [MySqlHelper .ExecuteDataRow Method](#)

Executes a single SQL statement and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Public Shared Function ExecuteDataRow( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As DataRow
```

Syntax: C#

```
public static DataRow ExecuteDataRow( _
    string connectionString, _
    string commandText, _
    params MySqlParameter[] parms
```

```
) ;
```

Parameters

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute
- `parms`: Parameters to use for the command

Return Value

DataRow containing the first row of the resultset

See Also

[MySqlHelper Class, MySql.Data.MySqlClient Namespace](#)

22.2.7.1.5.1.2. ExecuteDataset Method

Executes a single SQL statement and returns the resultset in a DataSet. The state of the `MySqlConnection` object remains unchanged after execution of this method.

Overload List

Executes a single SQL statement and returns the resultset in a DataSet. The state of the `MySqlConnection` object remains unchanged after execution of this method.

- [public static DataSet ExecuteDataset\(MySqlConnection,string\);](#)

Executes a single SQL statement and returns the resultset in a DataSet. The state of the `MySqlConnection` object remains unchanged after execution of this method.

- [public static DataSet ExecuteDataset\(MySqlConnection,string,params MySqlParameter\[\]\);](#)

Executes a single SQL statement and returns the resultset in a DataSet. A new `MySqlConnection` object is created, opened, and closed during this method.

- [public static DataSet ExecuteDataset\(string,string\);](#)

Executes a single SQL statement and returns the resultset in a DataSet. A new `MySqlConnection` object is created, opened, and closed during this method.

- [public static DataSet ExecuteDataset\(string,string,params MySqlParameter\[\]\);](#)

See Also

22.2.7.1.5.1.2.1. `MySqlHelper.ExecuteDataset` Method

Executes a single SQL statement and returns the resultset in a DataSet. The state of the `MySqlConnection` object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    MySqlConnection connection,
    string commandText
);
```

Parameters

- **connection:** [MySqlConnection](#) object to use
- **commandText:** Command to execute

Return Value

DataSetcontaining the resultset

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteDataset Overload List](#)

22.2.7.1.5.1.2.2. [MySqlHelper .ExecuteDataset](#) Method

Executes a single SQL statement and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    MySqlConnection connection,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- **connection:** [MySqlConnection](#) object to use
- **commandText:** Command to execute
- **commandParameters:** Parameters to use for the command

Return Value

DataSetcontaining the resultset

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteDataset Overload List](#)

22.2.7.1.5.1.2.3. [MySqlHelper .ExecuteDataset](#) Method

Executes a single SQL statement and returns the resultset in a DataSet. A new [MySqlConnection](#) object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    string connectionString,
    string commandText
);
```

Parameters

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute

Return Value

DataSetcontaining the resultset

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteDataset Overload List](#)

22.2.7.1.5.1.2.4. `MySqlHelper.ExecuteDataset` Method

Executes a single SQL statement and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _ 
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    string connectionString,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute
- `commandParameters`: Parameters to use for the command

Return Value

DataSetcontaining the resultset

See Also

22.2.7.1.5.1.3. `ExecuteNonQuery` Method

Executes a single command against a MySQL database. The `MySqlConnection` is assumed to be open when the method is called and remains open after the method completes.

Overload List

Executes a single command against a MySQL database. The `MySqlConnection` is assumed to be open when the method is called and remains open after the method completes.

- `public static int ExecuteNonQuery(MySqlConnection, string, params MySqlParameter[]);`

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

- `public static int ExecuteNonQuery(string, string, params MySqlParameter[]);`

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.5.1.3.1. [MySqlHelper.ExecuteNonQuery](#) Method

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(
    MySqlConnection connection,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: SQL statement to be executed
- `commandParameters`: Array of [MySqlParameter](#) objects to use with the command.

Return Value

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteNonQuery Overload List](#)

22.2.7.1.5.1.3.2. [MySqlHelper.ExecuteNonQuery](#) Method

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(
    string connectionString,
    string commandText,
    params MySqlParameter[] parms
);
```

Parameters

- `connectionString`: [ConnectionString](#) to use
- `commandText`: SQL statement to be executed

- **parms:** Array of [MySqlParameter](#) objects to use with the command.

Return Value**See Also**

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteNonQuery Overload List](#)

22.2.7.1.5.1.4. ExecuteReader Method

Executes a single command against a MySQL database.

Overload List

Executes a single command against a MySQL database.

- [public static MySqlDataReader ExecuteReader\(string,string\);](#)

Executes a single command against a MySQL database.

- [public static MySqlDataReader ExecuteReader\(string,string,params MySqlParameter\[\]\);](#)

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.5.1.4.1. [MySqlHelper.ExecuteReader](#) Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(
    string connectionString,
    string commandText
);
```

Parameters

- **connectionString:** Settings to use for this command
- **commandText:** Command text to use

Return Value

[MySqlDataReader](#) object ready to read the results of the command

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteReader Overload List](#)

22.2.7.1.5.1.4.2. [MySqlHelper.ExecuteReader](#) Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
```

```
ParamArray commandParameters As MySqlParameter() _  
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(  
string connectionString,  
string commandText,  
params MySqlParameter[] commandParameters  
>;
```

Parameters

- **connectionString**: Settings to use for this command
- **commandText**: Command text to use
- **commandParameters**: Array of **MySqlParameter** objects to use with the command

Return Value

MySqlDataReader object ready to read the results of the command

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteReader Overload List](#)

22.2.7.1.5.1.5. ExecuteScalar Method

Execute a single command against a MySQL database.

Overload List

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(MySqlConnection,string\);](#)

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(MySqlConnection,string,params MySqlParameter\[\]\);](#)

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(string,string\);](#)

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(string,string,params MySqlParameter\[\]\);](#)

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#)

22.2.7.1.5.1.5.1. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
ByVal connection As MySqlConnection, _  
ByVal commandText As String _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(
MySqlConnection connection,
string commandText
);
```

Parameters

- **connection:** [MySqlConnection](#) object to use
- **commandText:** Command text to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteScalar Overload List](#)

22.2.7.1.5.1.5.2. [MySqlHelper .ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(
MySqlConnection connection,
string commandText,
params MySqlParameter[] commandParameters
);
```

Parameters

- **connection:** [MySqlConnection](#) object to use
- **commandText:** Command text to use for the command
- **commandParameters:** Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteScalar Overload List](#)

22.2.7.1.5.1.5.3. [MySqlHelper .ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(
    string connectionString,
    string commandText
);
```

Parameters

- **connectionString**: Settings to use for the update
- **commandText**: Command text to use for the update

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySqlHelper Class](#), [MySql.Data.MySqlClient Namespace](#), [MySqlHelper.ExecuteScalar Overload List](#)

22.2.7.1.5.1.5.4. `MySqlHelper.ExecuteScalar` Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(
    string connectionString,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- **connectionString**: Settings to use for the command
- **commandText**: Command text to use for the command
- **commandParameters**: Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

22.2.7.1.5.1.6. `MySqlHelper.UpdateDataSet` Method

Updates the given table with data from the given DataSet

Syntax: Visual Basic

```
Public Shared Sub UpdateDataSet( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ByVal ds As DataSet, _
    ByVal tablename As String _
)
```

Syntax: C#

```
public static void UpdateDataSet(
```

```
string connectionString,
string commandText,
DataSets ds,
string tablename
);
```

Parameters

- **connectionString**: Settings to use for the update
- **commandText**: Command text to use for the update
- **ds**: DataSet containing the new data to use in the update
- **tablename**: Tablename in the data set to update

See Also

Public Instance Constructors

 MySqlConversionException Constructor	Ctor
---	------

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

 Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
--	---

GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

Protected Instance Properties

HResult(inherited from Exception)	Gets or sets HRESULT, a coded numeric value that is assigned to a specific exception.
-----------------------------------	---

Protected Instance Methods

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

Public Static (Shared) Type Conversions

 Explicit MySqlDateTime to DateTime Conversion
--

Public Instance Properties

 Day	Returns the day portion of this datetime
 Hour	Returns the hour portion of this datetime
 IsNull (inherited from MySqlValue)	
 IsValidDateTime	Indicates if this object contains a value that can be represented as a DateTime
 Minute	Returns the minute portion of this datetime
 Month	Returns the month portion of this datetime
 Second	Returns the second portion of this datetime
 ValueAsObject (inherited from MySqlValue)	Returns the value of this field as an object
 Year	Returns the year portion of this datetime

Public Instance Methods

 Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
 GetDateTime	Returns this value as a DateTime
 GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
 GetType (inherited from Object)	Gets the Type of the current instance.
 ToString	Returns a MySQL specific string representation of this value

Protected Instance Fields

 classType (inherited from MySqlValue)	The system type represented by this value
 dbType (inherited from MySqlValue)	The generic dbtype of this value
isNull (inherited from MySqlValue)	Is this value null
 mySqlDbType (inherited from MySqlValue)	The specific MySQL db type
 mySqlTypeName (inherited from MySqlValue)	The MySQL specific typename of this value
 objectValue (inherited from MySqlValue)	

Protected Instance Methods

 Finalize (inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage
---	--

	collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

22.2.8. Connector/NET Support

The developers of Connector/NET greatly value the input of our users in the software development process. If you find Connector/NET lacking some feature important to you, or if you discover a bug and need to file a bug report, please use the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

22.2.8.1. Connector/NET Community Support

- Community support for Connector/NET can be found through the forums at <http://forums.mysql.com>.
- Community support for Connector/NET can also be found through the mailing lists at <http://lists.mysql.com>.
- Paid support is available from Oracle. Additional information is available at <http://dev.mysql.com/support/>.

22.2.8.2. How to report Connector/NET Problems or Bugs

If you encounter difficulties or problems with Connector/NET, contact the Connector/NET community [Section 22.2.8.1, “Connector/NET Community Support”](#).

You should first try to execute the same SQL statements and commands from the `mysql` client program or from `admndemo`. This helps you determine whether the error is in Connector/NET or MySQL.

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/NET version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

22.2.8.3. Connector/NET Change History

The Connector/NET Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.4, “MySQL Connector/NET Change History”](#).

22.2.9. Connector/NET FAQ

Questions

- [23.2.9.1: How do I obtain the value of an auto-incremented column?](#)

Questions and Answers

23.2.9.1: How do I obtain the value of an auto-incremented column?

When using `CommandBuilder`, setting `ReturnGeneratedIdentifiers` property to `true` no longer works, as `CommandBuilder` does not add `last_insert_id()` by default.

`CommandBuilder` hooks up to the `DataAdapter.RowUpdating` event handler, which means it will get called for every row. It examines the command object and, if it is the same referenced object, it essentially rebuilds the object, thereby destroying your command text changes.

One approach to solving this problem is to clone the command object so you have a different actual reference:

```
dataAdapter.InsertCommand = cb.GetInsertCommand().Clone()
```

This will work, but since the CommandBuilder is still connected to the DataAdapter, the RowUpdating event will still fire and performance will be hit. To stop that, once all your commands have been added you need to disconnect the CommandBuilder from the DataAdapter:

```
cb.DataAdapter = null;
```

The last requirement is to make sure the `id` that is returned by `last_insert_id()` has the correct name. For example:

```
SELECT last_insert_id() AS id
```

A complete working example is shown here:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;

using System.Data;
using MySql.Data;
using MySql.Data.MySqlClient;

namespace GetAutoIncId
{
    class Program
    {
        static void Main(string[] args)
        {
            string connStr = "server=localhost;user=root;database=TestDB;port=3306;password=*****;";
            MySqlConnection conn = new MySqlConnection(connStr);

            try
            {
                Console.WriteLine("Connecting to MySQL...");
                conn.Open();

                string sql = "SELECT * FROM TestTable";

                MySqlDataAdapter da = new MySqlDataAdapter(sql, conn);
                MySqlCommandBuilder cb = new MySqlCommandBuilder(da);

                MySqlCommand cmd = new MySqlCommand();
                cmd.Connection = conn;
                cmd.CommandText = sql;
                // use Cloned object to avoid .NET rebuilding the object, and
                // thereby throwing away our command text additions.
                MySqlCommand insertCmd = cb.GetInsertCommand().Clone();
                insertCmd.CommandText = insertCmd.CommandText + ";SELECT last_insert_id() AS id";
                insertCmd.UpdatedRowSource = UpdateRowSource.FirstReturnedRecord;
                da.InsertCommand = insertCmd;
                cbDataAdapter = null; // Unhook RowUpdating event handler

                DataTable dt = new DataTable();
                da.Fill(dt);

                DataRow row = dt.NewRow();
                row["name"] = "Joe Smith";

                dt.Rows.Add(row);
                da.Update(dt);

                System.Console.WriteLine("ID after update: " + row["id"]);
            }
            catch (Exception ex)
            {
                Console.WriteLine(ex.ToString());
            }

            conn.Close();
            Console.WriteLine("Done.");
        }
    }
}
```

22.3. MySQL Connector/J

MySQL provides connectivity for client applications developed in the Java programming language through a JDBC driver, which is called MySQL Connector/J.

MySQL Connector/J is a JDBC Type 4 driver. Different versions are available that are compatible with the JDBC 3.0 and JDBC 4.0 specifications. The Type 4 designation means that the driver is pure-Java implementation of the MySQL protocol and does not

rely on the MySQL client libraries.

Although JDBC is useful by itself, we would hope that if you are not familiar with JDBC that after reading the first few sections of this manual, that you would avoid using naked JDBC for all but the most trivial problems and consider using one of the popular persistence frameworks such as [Hibernate](#), [Spring's JDBC templates](#) or [Ibatis SQL Maps](#) to do the majority of repetitive work and heavier lifting that is sometimes required with JDBC.

This section is not designed to be a complete JDBC tutorial. If you need more information about using JDBC you might be interested in the following online tutorials that are more in-depth than the information presented here:

- [JDBC Basics](#): A tutorial from Sun covering beginner topics in JDBC
- [JDBC Short Course](#): A more in-depth tutorial from Sun and JGuru

Key topics:

- For help with connection strings, connection options setting up your connection through JDBC, see [Section 22.3.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#).
- For tips on using Connector/J and JDBC with generic J2EE toolkits, see [Section 22.3.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#).
- Developers using the Tomcat server platform, see [Section 22.3.5.2.2, “Using Connector/J with Tomcat”](#).
- Developers using JBoss, see [Section 22.3.5.2.3, “Using Connector/J with JBoss”](#).
- Developers using Spring, see [Section 22.3.5.2.4, “Using Connector/J with Spring”](#).
- Developers using GlassFish (Sun Application Server), see [Section 22.3.5.2.5, “Using Connector/J with GlassFish”](#).

22.3.1. Connector/J Versions

There are currently four versions of MySQL Connector/J available:

- Connector/J 5.1 is the Type 4 pure Java JDBC driver, which conforms to the JDBC 3.0 and JDBC 4.0 specifications. It provides compatibility with all the functionality of MySQL, including 4.1, 5.0, 5.1, 5.4 and 5.5. Connector/J 5.1 provides ease of development features, including auto-registration with the Driver Manager, standardized validity checks, categorized SQLExceptions, support for the JDBC-4.0 XML processing, per connection client information, `NCHAR`, `NVARCHAR` and `NCLOB` types. This release also includes all bug fixes up to and including Connector/J 5.0.6.
- Connector/J 5.0 provides support for all the functionality offered by Connector/J 3.1 and includes distributed transaction (XA) support.
- Connector/J 3.1 was designed for connectivity to MySQL 4.1 and MySQL 5.0 servers and provides support for all the functionality in MySQL 5.0 except distributed transaction (XA) support.
- Connector/J 3.0 provides core functionality and was designed with connectivity to MySQL 3.x or MySQL 4.1 servers, although it will provide basic compatibility with later versions of MySQL. Connector/J 3.0 does not support server-side prepared statements, and does not support any of the features in versions of MySQL later than 4.1.

The following table summarizes the Connector/J versions available:

Connector/J version	Driver Type	JDBC version	MySQL Server version	Status
5.1	4	3.0, 4.0	4.1, 5.0, 5.1, 5.4, 5.5	Recommended version
5.0	4	3.0	4.1, 5.0	Released version
3.1	4	3.0	4.1, 5.0	Obsolete
3.0	4	3.0	3.x, 4.1	Obsolete

The current recommended version for Connector/J is 5.1. This guide covers all four connector versions, with specific notes given where a setting applies to a specific option.

22.3.1.1. Java Versions Supported

The following table summarizes Connector/J Java dependencies:

Connector/J version	Java RTE required	JDK required (to build source code)
5.1	1.5.x, 1.6.x	1.6.x and 1.5.x
5.0	1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x
3.1	1.2.x, 1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x
3.0	1.2.x, 1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x

MySQL Connector/J does not support JDK-1.1.x or JDK-1.0.x.

Because of the implementation of `java.sql.Savepoint`, Connector/J 3.1.0 and newer will not run on a Java runtime older than 1.4 unless the class verifier is turned off (by setting the `-Xverify:none` option to the Java runtime). This is because the class verifier will try to load the class definition for `java.sql.Savepoint` even though it is not accessed by the driver unless you actually use savepoint functionality.

Caching functionality provided by Connector/J 3.1.0 or newer is also not available on JVMs older than 1.4.x, as it relies on `java.util.LinkedHashMap` which was first available in JDK-1.4.0.

If you are building Connector/J from source code using the source distribution (see [Section 22.3.2.4, “Installing from the Development Source Tree”](#)) then you must use JDK 1.4.2 or newer to compile the Connector package. For Connector/J 5.1 you must have both JDK-1.6.x. and JDK-1.5.x installed to be able to build the source code.

22.3.2. Connector/J Installation

You can install the Connector/J package using either the binary or source distribution. The binary distribution provides the easiest method for installation; the source distribution enables you to customize your installation further. With either solution, you must manually add the Connector/J location to your Java `CLASSPATH`.

If you are upgrading from a previous version, read the upgrade information before continuing. See [Section 22.3.2.3, “Upgrading from an Older Version”](#).

Connector/J is also available as part of the Maven project. More information, and the Connector/J JAR files can be found at the [Maven repository](#).

22.3.2.1. Installing Connector/J from a Binary Distribution

The easiest method of installation is to use the binary distribution of the Connector/J package. The binary distribution is available either as a Tar/Gzip or Zip file which you must extract to a suitable location and then optionally make the information about the package available by changing your `CLASSPATH` (see [Section 22.3.2.2, “Installing the Driver and Configuring the CLASSPATH”](#)).

MySQL Connector/J is distributed as a .zip or .tar.gz archive containing the sources, the class files, and the JAR archive named `mysql-connector-java-[version]-bin.jar`, and starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar`.

Starting with Connector/J 3.1.9, the `.class` files that constitute the JAR files are only included as part of the driver JAR file.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or a bug, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

You will need to use the appropriate graphical or command-line utility to extract the distribution (for example, WinZip for the .zip archive, and `tar` for the .tar.gz archive). Because there are potentially long file names in the distribution, we use the GNU tar archive format. You will need to use GNU tar (or an application that understands the GNU tar archive format) to unpack the .tar.gz variant of the distribution.

22.3.2.2. Installing the Driver and Configuring the `CLASSPATH`

Once you have extracted the distribution archive, you can install the driver by placing `mysql-connector-or-java-[version]-bin.jar` in your classpath, either by adding the full path to it to your `CLASSPATH` environment variable, or by directly specifying it with the command line switch `-cp` when starting your JVM.

If you are going to use the driver with the JDBC DriverManager, you would use `com.mysql.jdbc.Driver` as the class that implements `java.sql.Driver`.

You can set the `CLASSPATH` environment variable under UNIX, Linux or Mac OS X either locally for a user within their `.profile`, `.login` or other login file. You can also set it globally by editing the global `/etc/profile` file.

For example, under a C shell (csh, tcsh) you would add the Connector/J driver to your `CLASSPATH` using the following:

```
shell> setenv CLASSPATH /path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Or with a Bourne-compatible shell (sh, ksh, bash):

```
shell> export set CLASSPATH=/path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Within Windows 2000, Windows XP, Windows Server 2003 and Windows Vista, you must set the environment variable through the System Control Panel.

If you want to use MySQL Connector/J with an application server such as GlassFish, Tomcat or JBoss, you will have to read your vendor's documentation for more information on how to configure third-party class libraries, as most application servers ignore the `CLASSPATH` environment variable. For configuration examples for some J2EE application servers, see [Section 22.3.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#). However, the authoritative source for JDBC connection pool configuration information for your particular application server is the documentation for that application server.

If you are developing servlets or JSPs, and your application server is J2EE-compliant, you can put the driver's .jar file in the WEB-INF/lib subdirectory of your webapp, as this is a standard location for third party class libraries in J2EE web applications.

You can also use the `MysqlDataSource` or `MysqlConnectionPoolDataSource` classes in the `com.mysql.jdbc.jdbc2.optional` package, if your J2EE application server supports or requires them. Starting with Connector/J 5.0.0, the `javax.sql.XADataSource` interface is implemented using the `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` class, which supports XA distributed transactions when used in combination with MySQL server version 5.0.

The various `MysqlDataSource` classes support the following parameters (through standard set mutators):

- user
- password
- serverName (see the previous section about fail-over hosts)
- databaseName
- port

22.3.2.3. Upgrading from an Older Version

We try to keep the upgrade process as easy as possible, however as is the case with any software, sometimes changes need to be made in new versions to support new features, improve existing functionality, or comply with new standards.

This section has information about what users who are upgrading from one version of Connector/J to another (or to a new version of the MySQL server, with respect to JDBC functionality) should be aware of.

22.3.2.3.1. Upgrading from MySQL Connector/J 3.0 to 3.1

Connector/J 3.1 is designed to be backward-compatible with Connector/J 3.0 as much as possible. Major changes are isolated to new functionality exposed in MySQL-4.1 and newer, which includes Unicode character sets, server-side prepared statements, SQL-State codes returned in error messages by the server and various performance enhancements that can be enabled or disabled using configuration properties.

- **Unicode Character Sets:** See the next section, as well as [Section 9.1, “Character Set Support”](#), for information on this new feature of MySQL. If you have something misconfigured, it will usually show up as an error with a message similar to `Illegal mix of collations`.
- **Server-side Prepared Statements:** Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer).

Starting with version 3.1.7, the driver scans SQL you are preparing using all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this feature by passing `emulateUnsupportedPstmts=false` in your JDBC URL.

If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the connection property `useServerPrepStmts=false`

- **Datetimes** with all-zero components (`0000-00-00 . . .`): These values can not be represented reliably in Java. Connector/J 3.0.x always converted them to `NULL` when being read from a `ResultSet`.

Connector/J 3.1 throws an exception by default when these values are encountered as this is the most correct behavior according to the JDBC and SQL standards. This behavior can be modified using the `zeroDateTimeBehavior` configuration property. The permissible values are:

- `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`.
- `convertToNull`, which returns `NULL` instead of the date.
- `round`, which rounds the date to the nearest closest value which is `0001-01-01`.

Starting with Connector/J 3.1.7, `ResultSet.getString()` can be decoupled from this behavior using `noDatetimeStringSync=true` (the default value is `false`) so that you can retrieve the unaltered all-zero value as a String. It should be noted that this also precludes using any time zone conversions, therefore the driver will not allow you to enable `noDatetimeStringSync` and `useTimezone` at the same time.

- **New SQLState Codes:** Connector/J 3.1 uses SQL:1999 `SQLState` codes returned by the MySQL server (if supported), which are different from the legacy X/Open state codes that Connector/J 3.0 uses. If connected to a MySQL server older than MySQL-4.1.0 (the oldest version to return `SQLStates` as part of the error code), the driver will use a built-in mapping. You can revert to the old mapping by using the configuration property `useSqlStateCodes=false`.
- **ResultSet.getString():** Calling `ResultSet.getString()` on a `BLOB` column will now return the address of the `byte[]` array that represents it, instead of a `String` representation of the `BLOB`. `BLOB` values have no character set, so they cannot be converted to `java.lang.String`s without data loss or corruption.

To store strings in MySQL with LOB behavior, use one of the `TEXT` types, which the driver will treat as a `java.sql.Clob`.

- **Debug builds:** Starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar` is shipped alongside the normal binary jar file that is named `mysql-connector-java-[version]-bin.jar`.

Starting with Connector/J 3.1.9, we do not ship the .class files unbundled, they are only available in the JAR archives that ship with the driver.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

22.3.2.3.2. Upgrading to MySQL Connector/J 5.1.x

- In Connector/J 5.0.x and earlier, the alias for a table in a `SELECT` statement is returned when accessing the result set metadata using `ResultSetMetaData.getColumnName()`. This behavior however is not JDBC compliant, and in Connector/J 5.1 this behavior was changed so that the original table name, rather than the alias, is returned.

The JDBC-compliant behavior is designed to let API users reconstruct the DML statement based on the metadata within `ResultSet` and `ResultSetMetaData`.

You can get the alias for a column in a result set by calling `ResultSetMetaData.getColumnLabel()`. If you want to use the old noncompliant behavior with `ResultSetMetaData.getColumnName()`, use the `useOldAliasAsMetadataBehavior` option and set the value to `true`.

In Connector/J 5.0.x the default value of `useOldAliasMetadataBehavior` was true, but in Connector/J 5.1 this was changed to a default value of false.

22.3.2.3.3. JDBC-Specific Issues When Upgrading to MySQL Server 4.1 or Newer

- *Using the UTF-8 Character Encoding* - Prior to MySQL server version 4.1, the UTF-8 character encoding was not supported by the server, however the JDBC driver could use it, allowing storage of multiple character sets in latin1 tables on the server.

Starting with MySQL-4.1, this functionality is deprecated. If you have applications that rely on this functionality, and can not upgrade them to use the official Unicode character support in MySQL server version 4.1 or newer, you should add the following property to your connection URL:

```
useOldUTF8Behavior=true
```

- *Server-side Prepared Statements* - Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer). If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the following connection property:

```
useServerPrepStmts=false
```

22.3.2.4. Installing from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/J up and running on your system, you should use a standard binary release distribution.

To install MySQL Connector/J from the development source tree, make sure that you have the following prerequisites:

- A Bazaar client, to check out the sources from our Launchpad repository (available from <http://bazaar-vcs.org/>).
- Apache Ant version 1.7 or newer (available from <http://ant.apache.org/>).
- JDK 1.4.2 or later. Although MySQL Connector/J can be used with older JDKs, to compile it from source you must have at least JDK 1.4.2. If you are building Connector/J 5.1 you will need JDK 1.6.x and an older JDK such as JDK 1.5.x. You will then need to point your JAVA_HOME environment variable at the older installation.

The source code repository for MySQL Connector/J is located on Launchpad at <https://code.launchpad.net/connectorj>.

To check out and compile a specific branch of MySQL Connector/J, follow these steps:

1. Check out the latest code from the branch that you want with one of the following commands.

To check out the latest development branch use:

```
shell> bzr branch lp:connectorj
```

This creates a `connectorj` subdirectory in the current directory that contains the latest sources for the requested branch.

To check out the latest 5.1 code use:

```
shell> bzr branch lp:connectorj/5.1
```

This will create a `5.1` subdirectory in the current directory containing the latest 5.1 code.

2. If you are building Connector/J 5.1 make sure that you have both JDK 1.6.x installed and an older JDK such as JDK 1.5.x. This is because Connector/J supports both JDBC 3.0 (which was prior to JDK 1.6.x) and JDBC 4.0. Set your JAVA_HOME environment variable to the path of the older JDK installation.
3. Change location to either the `connectorj` or `5.1` directory, depending on which branch you want to build, to make it your current working directory. For example:

```
shell> cd connectorj
```

4. If you are building Connector/J 5.1 you need to edit the `build.xml` to reflect the location of your JDK 1.6.x installation. The lines that you need to change are:

```
<property name="com.mysql.jdbc.java6.javac" value="C:\jvms\jdk1.6.0\bin\javac.exe" />
<property name="com.mysql.jdbc.java6.rtjar" value="C:\jvms\jdk1.6.0\jre\lib\rt.jar" />
```

Alternatively, you can set the value of these property names through the Ant `-D` option.

5. Issue the following command to compile the driver and create a `.jar` file suitable for installation:

```
shell> ant dist
```

This creates a `build` directory in the current directory, where all build output will go. A directory is created in the `build` directory that includes the version number of the sources you are building from. This directory contains the sources, compiled `.class` files, and a `.jar` file suitable for deployment. For other possible targets, including ones that will create a fully packaged distribution, issue the following command:

```
shell> ant -projecthelp
```

6. A newly created `.jar` file containing the JDBC driver will be placed in the directory `build/mysql-connector-java-[version]`.

Install the newly created JDBC driver as you would a binary `.jar` file that you download from MySQL by following the instructions in [Section 22.3.2.2, “Installing the Driver and Configuring the CLASSPATH”](#).

A package containing both the binary and source code for Connector/J 5.1 can also be found at the following location: [Connector/J 5.1 Download](#)

22.3.3. Connector/J Examples

Examples of using Connector/J are located throughout this document, this section provides a summary and links to these examples.

- [Example 22.1, “Connector/J: Obtaining a connection from the `DriverManager`”](#)
- [Example 22.2, “Connector/J: Using `java.sql.Statement` to execute a `SELECT` query”](#)
- [Example 22.3, “Connector/J: Calling Stored Procedures”](#)
- [Example 22.4, “Connector/J: Using `Connection.prepareStatement\(\)`”](#)
- [Example 22.5, “Connector/J: Registering output parameters”](#)
- [Example 22.6, “Connector/J: Setting `CallableStatement` input parameters”](#)
- [Example 22.7, “Connector/J: Retrieving results and output parameter values”](#)
- [Example 22.8, “Connector/J: Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys\(\)`”](#)
- [Example 22.9, “Connector/J: Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID\(\)`”](#)
- [Example 22.10, “Connector/J: Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`”](#)
- [Example 22.11, “Connector/J: Using a connection pool with a J2EE application server”](#)

22.3.4. Connector/J (JDBC) Reference

This section of the manual contains reference material for MySQL Connector/J, some of which is automatically generated during the Connector/J build process.

22.3.4.1. Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J

The name of the class that implements `java.sql.Driver` in MySQL Connector/J is `com.mysql.jdbc.Driver`. The `org.gjt.mm.mysql.Driver` class name is also usable to remain backward-compatible with MM.MySQL. You should use this class name when registering the driver, or when otherwise configuring software to use MySQL Connector/J.

The JDBC URL format for MySQL Connector/J is as follows, with items in square brackets ([,]) being optional:

```
jdbc:mysql://[host][,failoverhost...][:port]/[database] «
[?propertyName1 [=propertyValue1][&propertyName2 [=propertyValue2]]...]
```

If the host name is not specified, it defaults to 127.0.0.1. If the port is not specified, it defaults to 3306, the default port number for

MySQL servers.

```
jdbc:mysql://[host:port],[host:port].../[database] »
[?propertyName1][=propertyValue1][&propertyName2][=propertyValue2]...
```

If the database is not specified, the connection will be made with no default database. In this case, you will need to either call the `setCatalog()` method on the Connection instance or fully specify table names using the database name (that is, `SELECT dbname.tablename.colname FROM dbname.tablename...`) in your SQL. Not specifying the database to use upon connection is generally only useful when building tools that work with multiple databases, such as GUI database managers.

Note

JDBC clients should never employ the `USE database` statement to specify the desired database, they should always use the `Connection.setCatalog()` method instead.

MySQL Connector/J has fail-over support. This enables the driver to fail-over to any number of slave hosts and still perform read-only queries. Fail-over only happens when the connection is in an `autoCommit(true)` state, because fail-over can not happen reliably when a transaction is in progress. Most application servers and connection pools set `autoCommit` to `true` at the end of every transaction/connection use.

The fail-over functionality has the following behavior:

- If the URL property `autoReconnect` is false: Failover only happens at connection initialization, and fallback occurs when the driver determines that the first host has become available again.
- If the URL property `autoReconnect` is true: Failover happens when the driver determines that the connection has failed (before *every* query), and falls back to the first host when it determines that the host has become available again (after `queriesBeforeRetryMaster` queries have been issued).

In either case, whenever you are connected to a "failed-over" server, the connection will be set to read-only state, so queries that would modify data will have exceptions thrown (the query will **never** be processed by the MySQL server).

Configuration properties define how Connector/J will make a connection to a MySQL server. Unless otherwise noted, properties can be set for a DataSource object or for a Connection object.

Configuration Properties can be set in one of the following ways:

- Using the `set*`() methods on MySQL implementations of `java.sql.DataSource` (which is the preferred method when using implementations of `java.sql.DataSource`):
 - `com.mysql.jdbc.optional.MysqlDataSource`
 - `com.mysql.jdbc.optional.MysqlConnectionPoolDataSource`
- As a key/value pair in the `java.util.Properties` instance passed to `DriverManager.getConnection()` or `Driver.connect()`
- As a JDBC URL parameter in the URL given to `java.sql.DriverManager.getConnection()`, `java.sql.Driver.connect()` or the MySQL implementations of the `javax.sql.DataSource` `setURL()` method.

Note

If the mechanism you use to configure a JDBC URL is XML-based, you will need to use the XML character literal `&` to separate configuration parameters, as the ampersand is a reserved character for XML.

The properties are listed in the following tables.

Connection/Authentication.

Property Name	Definition	Default Value	Since Version
user	The user to connect as		all versions
password	The password to use when connecting		all versions
socketFactory	The name of the class that the driver should use for creating socket connections to the server. This class must implement the	com.mysql.jd-	3.0.3

	interface 'com.mysql.jdbc.SocketFactory' and have public no-args constructor.	bc.StandardSocketFactory	
connectTimeout	Timeout for socket connect (in milliseconds), with 0 being no timeout. Only works on JDK-1.4 or newer. Defaults to '0'.	0	3.0.1
socketTimeout	Timeout on network socket operations (0, the default means no timeout).	0	3.0.1
connectionLifecycleInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.ConnectionLifecycleInterceptor" that should be notified of connection lifecycle events (creation, destruction, commit, rollback, setCatalog and setAutoCommit) and potentially alter the execution of these commands. ConnectionLifecycleInterceptors are "stackable", more than one interceptor may be specified via the configuration property as a comma-delimited list, with the interceptors executed in order from left to right.		5.1.4
useConfigs	Load the comma-delimited list of configuration properties before parsing the URL or applying user-specified properties. These configurations are explained in the 'Configurations' of the documentation.		3.1.5
interactiveClient	Set the CLIENT_INTERACTIVE flag, which tells MySQL to timeout connections based on INTERACTIVE_TIMEOUT instead of WAIT_TIMEOUT	false	3.1.0
localSocketAddress	Hostname or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.		5.0.5
propertiesTransform	An implementation of com.mysql.jdbc.ConnectionPropertiesTransform that the driver will use to modify URL properties passed to the driver before attempting a connection		3.1.4
useCompression	Use zlib compression when communicating with the server (true/false)? Defaults to 'false'.	false	3.0.17

Networking.

Property Name	Definition	Default Value	Since Version
maxAllowedPacket	Maximum allowed packet size to send to server. If not set, the value of system variable 'max_allowed_packet' will be used to initialize this upon connecting. This value will not take effect if set larger than the value of 'max_allowed_packet'.	-1	5.1.8
tcpKeepAlive	If connecting using TCP/IP, should the driver set SO_KEEPALIVE?	true	5.0.7
tcpNoDelay	If connecting using TCP/IP, should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm)?	true	5.0.7
tcpRcvBuf	If connecting using TCP/IP, should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpSndBuf	If connecting using TCP/IP, shuold the driver set SO SND_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpTrafficClass	If connecting using TCP/IP, should the driver set traffic class or type-of-service fields ?See the documentation for java.net.Socket.setTrafficClass() for more information.	0	5.0.7

High Availability and Clustering.

Property Name	Definition	Default Value	Since Version
autoReconnect	Should the driver try to re-establish stale and/or dead connec-	false	1.1

	tions? If enabled the driver will throw an exception for a queries issued on a stale or dead connection, which belong to the current transaction, but will attempt reconnect before the next query issued on the connection in a new transaction. The use of this feature is not recommended, because it has side effects related to session state and data consistency when applications don't handle SQLExceptions properly, and is only designed to be used when you are unable to configure your application to handle SQLExceptions resulting from dead and stale connections properly. Alternatively, investigate setting the MySQL server variable "wait_timeout" to some high value rather than the default of 8 hours.		
autoReconnectForPools	Use a reconnection strategy appropriate for connection pools (defaults to 'false')	false	3.1.3
failOverReadOnly	When failing over in autoReconnect mode, should the connection be set to 'read-only'?	true	3.0.12
maxReconnects	Maximum number of reconnects to attempt if autoReconnect is true, default is '3'.	3	1.1
reconnectAtTxEnd	If autoReconnect is set to true, should the driver attempt reconnections at the end of every transaction?	false	3.0.10
retriesAllDown	When using loadbalancing, the number of times the driver should cycle through available hosts, attempting to connect. Between cycles, the driver will pause for 250ms if no servers are available.	120	5.1.6
initialTimeout	If autoReconnect is enabled, the initial time to wait between re-connect attempts (in seconds, defaults to '2').	2	1.1
roundRobinLoadBalance	When autoReconnect is enabled, and failoverReadonly is false, should we pick hosts to connect to on a round-robin basis?	false	3.1.2
queriesBeforeRetryMaster	Number of queries to issue before falling back to master when failed over (when using multi-host failover). Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Defaults to 50.	50	3.0.2
secondsBeforeRetryMaster	How long should the driver wait, when failed over, before attempting	30	3.0.2
selfDestructOnPingMaxOperations	=If set to a non-zero value, the driver will report close the connection and report failure when Connection.ping() or Connection.isValid(int) is called if the connection's count of commands sent to the server exceeds this value.	0	5.1.6
selfDestructOnPingSecondsLifetime	If set to a non-zero value, the driver will report close the connection and report failure when Connection.ping() or Connection.isValid(int) is called if the connection's lifetime exceeds this value.	0	5.1.6
resourceId	A globally unique name that identifies the resource that this datasource or connection is connected to, used for XAResource.isSameRM() when the driver can't determine this value based on hostnames used in the URL		5.0.1

Security.

Property Name	Definition	Default Value	Since Version
allowMultiQueries	Allow the use of ';' to delimit multiple queries during one statement (true/false), defaults to 'false'	false	3.1.1
useSSL	Use SSL when communicating with the server (true/false), defaults to 'false'	false	3.0.2
requireSSL	Require SSL connection if useSSL=true? (defaults to 'false').	false	3.1.0
verifyServerCertificate	If "useSSL" is set to "true", should the driver verify the server's certificate? When using this feature, the keystore parameters should be specified by the "clientCertificateKeyStore*" properties, rather than system properties.	true	5.1.6

clientCertificateKeyStoreUrl	URL to the client certificate KeyStore (if not specified, use defaults)		5.1.0
clientCertificateKeyStoreType	KeyStore type for client certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.)		5.1.0
clientCertificateKeyStorePassword	Password for the client certificates KeyStore		5.1.0
trustCertificateKeyStoreUrl	URL to the trusted root certificate KeyStore (if not specified, use defaults)		5.1.0
trustCertificateKeyStoreType	KeyStore type for trusted root certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.)		5.1.0
trustCertificateKeyStorePassword	Password for the trusted root certificates KeyStore		5.1.0
allowLoadLocalInfile	Should the driver allow use of 'LOAD DATA LOCAL INFILE...' (defaults to 'true').	true	3.0.3
allowUrlInLocalInfile	Should the driver allow URLs in 'LOAD DATA LOCAL INFILE' statements?	false	3.1.4
paranoid	Take measures to prevent exposure sensitive information in error messages and clear data structures holding sensitive data when possible? (defaults to 'false')	false	3.0.1
passwordCharacterEncoding	What character encoding is used for passwords? Leaving this set to the default value (null), uses the platform character set, which works for ISO8859_1 (i.e. "latin1") passwords. For passwords in other character encodings, the encoding will have to be specified with this property, as it's not possible for the driver to auto-detect this.		5.1.7

Performance Extensions.

Property Name	Definition	Default Value	Since Version
callableStmtCacheSize	If 'cacheCallableStmts' is enabled, how many callable statements should be cached?	100	3.1.2
metadataCacheSize	The number of queries to cache ResultSetMetadata for if cacheResultSetMetaData is set to 'true' (default 50)	50	3.1.1
useLocalSessionState	Should the driver refer to the internal values of autocommit and transaction isolation that are set by Connection.setAutoCommit() and Connection.setTransactionIsolation() and transaction state as maintained by the protocol, rather than querying the database or blindly sending commands to the database for commit() or rollback() method calls?	false	3.1.7
useLocalTransactionState	Should the driver use the in-transaction state provided by the MySQL protocol to determine if a commit() or rollback() should actually be sent to the database?	false	5.1.7
prepStmtCacheSize	If prepared statement caching is enabled, how many prepared statements should be cached?	25	3.0.10
prepStmtCacheSqlLimit	If prepared statement caching is enabled, what's the largest SQL the driver will cache the parsing for?	256	3.0.10
alwaysSendSetIsolation	Should the driver always communicate with the database when Connection.setTransactionIsolation() is called? If set to false, the driver will only communicate with the database when the requested transaction isolation is different than the whichever is newer, the last value that was set via Connection.setTransactionIsolation(), or the value that was read from the server when the connection was established.	true	3.1.7
maintainTimeStats	Should the driver maintain various internal timers to enable idle time calculations as well as more verbose error messages when	true	3.1.9

	the connection to the server fails? Setting this property to false removes at least two calls to System.currentTimeMillis() per query.		
useCursorFetch	If connected to MySQL > 5.0.2, and setFetchSize() > 0 on a statement, should that statement use cursor-based fetching to retrieve rows?	false	5.0.0
blobSendChunkSize	Chunk to use when sending BLOB/CLOBs via ServerPreparedStatements	1048576	3.1.9
cacheCallableStmts	Should the driver cache the parsing stage of CallableStatements	false	3.1.2
cachePrepStmts	Should the driver cache the parsing stage of PreparedStatements of client-side prepared statements, the "check" for suitability of server-side prepared and server-side prepared statements themselves?	false	3.0.10
cacheResultSetMetadata	Should the driver cache ResultSetMetaData for Statements and PreparedStatements? (Req. JDK-1.4+, true/false, default 'false')	false	3.1.1
cacheServerConfiguration	Should the driver cache the results of 'SHOW VARIABLES' and 'SHOW COLLATION' on a per-URL basis?	false	3.1.5
defaultFetchSize	The driver will call setFetchSize(n) with this value on all newly-created Statements	0	3.1.9
dontTrackOpenResources	The JDBC specification requires the driver to automatically track and close resources, however if your application doesn't do a good job of explicitly calling close() on statements or result sets, this can cause memory leakage. Setting this property to true relaxes this constraint, and can be more memory efficient for some applications.	false	3.1.7
dynamicCalendars	Should the driver retrieve the default calendar when required, or cache it per connection/session?	false	3.1.5
elideSetAutoCommits	If using MySQL-4.1 or newer, should the driver only issue 'set autocommit=n' queries when the server's state doesn't match the requested state by Connection.setAutoCommit(boolean)?	false	3.1.3
enableQueryTimeouts	When enabled, query timeouts set via Statement.setQueryTimeout() use a shared java.util.Timer instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the TimerTask for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality.	true	5.0.6
holdResultsOpenOverStatementClose	Should the driver leave the result sets open on Statement.close() (enabling violates JDBC specification)	false	3.1.7
largeRowSizeThreshold	What size result set row should the JDBC driver consider "large", and thus use a more memory-efficient way of representing the row internally?	2048	5.1.1
loadBalanceStrategy	If using a load-balanced connection to connect to SQL nodes in a MySQL Cluster/NDB configuration (by using the URL prefix "jdbc:mysql:loadbalance://"), which load balancing algorithm should the driver use: (1) "random" - the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload. (2) "bestResponseTime" - the driver will route the request to the host that had the best response time for the previous transaction.	random	5.0.6
locatorFetchBufferSize	If 'emulateLocators' is configured to 'true', what size buffer should be used when fetching BLOB data for getBinaryInputStream?	1048576	3.2.1
rewriteBatchedStatements	Should the driver use multiqueries (irregardless of the setting of "allowMultiQueries") as well as rewriting of prepared statements for INSERT into multi-value inserts when executeBatch() is called? Notice that this has the potential for SQL injection if using plain java.sql.Statements and your code doesn't sanitize	false	3.1.13

	input correctly. Notice that for prepared statements, server-side prepared statements can not currently take advantage of this rewrite option, and that if you don't specify stream lengths when using PreparedStatement.set*Stream(), the driver won't be able to determine the optimum number of parameters per batch and you might receive an error from the driver that the resultant packet is too large. Statement.getGeneratedKeys() for these re-written statements only works when the entire batch includes INSERT statements.		
useDirectRowUnpack	Use newer result set row unpacking code that skips a copy from network buffers to a MySQL packet instance and instead reads directly into the result set row data buffers.	true	5.1.1
useDynamicCharsetInfo	Should the driver use a per-connection cache of character set information queried from the server when necessary, or use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver?	true	5.0.6
useFastDateParsing	Use internal String->Date/Time/Timestamp conversion routines to avoid excessive object creation?	true	5.0.5
useFastIntParsing	Use internal String->Integer conversion routines to avoid excessive object creation?	true	3.1.4
useJvmCharsetConverters	Always use the character encoding routines built into the JVM, rather than using lookup tables for single-byte character sets?	false	5.0.1
useReadAheadInput	Use newer, optimized non-blocking, buffered input stream when reading from the server?	true	3.1.5

Debugging/Profiling.

Property Name	Definition	Default Value	Since Version
logger	The name of a class that implements "com.mysql.jdbc.log.Log" that will be used to log messages to. (default is "com.mysql.jdbc.log.StandardLogger", which logs to STDERR)	com.mysql.jdbc.log.StandardLogger	3.1.1
gatherPerfMetrics	Should the driver gather performance metrics, and report them via the configured logger every 'reportMetricsIntervalMillis' milliseconds?	false	3.1.2
profileSQL	Trace queries and their execution/fetch times to the configured logger (true/false) defaults to 'false'	false	3.1.0
profileSql	Deprecated, use 'profileSQL' instead. Trace queries and their execution/fetch times on STDERR (true/false) defaults to 'false'		2.0.14
reportMetricsIntervalMillis	If 'gatherPerfMetrics' is enabled, how often should they be logged (in ms)?	30000	3.1.2
maxQuerySizeToLog	Controls the maximum length/size of a query that will get logged when profiling or tracing	2048	3.1.3
packetDebugBufferSize	The maximum number of packets to retain when 'enablePacketDebug' is true	20	3.1.3
slowQueryThresholdMillis	If 'logSlowQueries' is enabled, how long should a query (in ms) before it is logged as 'slow'?	2000	3.1.2
slowQueryThresholdNanos	If 'useNanosForElapsedTime' is set to true, and this property is set to a non-zero value, the driver will use this threshold (in nanosecond units) to determine if a query was slow.	0	5.0.7
useUsageAdvisor	Should the driver issue 'usage' warnings advising proper and efficient usage of JDBC and MySQL Connector/J to the log (true/false, defaults to 'false')?	false	3.1.1
autoGenerateTestcaseScript	Should the driver dump the SQL it is executing, including server-side prepared statements to STDERR?	false	3.1.9
autoSlowLog	Instead of using slowQueryThreshold* to determine if a query is slow enough to be logged, maintain statistics that allow the driver to determine queries that are outside the 99th percentile?	true	5.1.4

clientInfoProvider	The name of a class that implements the com.mysql.jdbc.JDBC4ClientInfoProvider interface in order to support JDBC-4.0's Connection.getClientInfo() methods	com.mysql.jdbc.JDBC4CommonClientInfoProvider	5.1.0
dumpMetadataOnColumnNotFound	Should the driver dump the field-level metadata of a result set into the exception message when ResultSet.findColumn() fails?	false	3.1.13
dumpQueriesOnException	Should the driver dump the contents of the query sent to the server in the message for SQLExceptions?	false	3.1.3
enablePacketDebug	When enabled, a ring-buffer of 'packetDebugBufferSize' packets will be kept, and dumped when exceptions are thrown in key areas in the driver's code	false	3.1.3
explainSlowQueries	If 'logSlowQueries' is enabled, should the driver automatically issue an 'EXPLAIN' on the server and send the results to the configured log at a WARN level?	false	3.1.2
includeInnodbStatusInDeadlockExceptions	Include the output of "SHOW ENGINE INNODB STATUS" in exception messages when deadlock exceptions are detected?	false	5.0.7
logSlowQueries	Should queries that take longer than 'slowQueryThresholdMillis' be logged?	false	3.1.2
logXaCommands	Should the driver log XA commands sent by MysqlXaConnection to the server, at the DEBUG level of logging?	false	5.0.5
profilerEventHandler	Name of a class that implements the interface com.mysql.jdbc.profiler.ProfilerEventHandler that will be used to handle profiling/tracing events.	com.mysql.jdbc.profiler.LoggingProfilerEventHandler	5.1.6
resultSetSizeThreshold	If the usage advisor is enabled, how many rows should a result set contain before the driver warns that it is suspiciously large?	100	5.0.5
traceProtocol	Should trace-level network protocol be logged?	false	3.1.2
useNanosForElapsedTime	For profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (JDK >= 1.5)?	false	5.0.7

Miscellaneous.

Property Name	Definition	Default Value	Since Version
useUnicode	Forces the driver to use Unicode character encodings. Should only be set to false either when the driver can't determine the character set mapping (in which case, specify the Java character encoding in the characterEncoding property), or you are trying to force the driver to use a character set that MySQL doesn't natively support. Should be 'true' for all versions of MySQL 4.1 or higher unless you are trying to emulate the character set handling support provided in MySQL 4.0. Value is true/false, defaults to 'true'	true	1.1g
characterEncoding	If 'useUnicode' is set to true, what Java character encoding should the driver use when dealing with strings? (defaults is to 'autodetect'). If the encoding cannot be determined, then an exception will be raised.		1.1g
characterSetResults	Character set to tell the server to return results as.		3.0.13
connectionCollation	If set, tells the server to use this collation via 'set collation_connection'		3.0.13
useBlobToStoreUTF8OutsideBMP	Tells the driver to treat [MEDIUM/LONG]BLOB columns as [LONG]VARCHAR columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.	false	5.1.3

utf8OutsideBmpExcludedColumnNamePattern	When "useBlobToStoreUTF8OutsideBMP" is set to "true", column names matching the given regex will still be treated as BLOBS unless they match the regex specified for "utf8OutsideBmpIncludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3
utf8OutsideBmpIncludedColumnNamePattern	Used to specify exclusion rules to "utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the java.util.regex package.		5.1.3
loadBalanceEnableJMX	Enables JMX-based management of load-balanced connection groups, including live addition/removal of hosts from load-balancing pool.	false	5.1.13
sessionVariables	A comma-separated list of name/value pairs to be sent as SET SESSION ... to the server when the driver connects.		3.1.8
useColumnNamesInFindColumn	Prior to JDBC-4.0, the JDBC specification had a bug related to what could be given as a "column name" to ResultSet methods like findColumn(), or getters that took a String property. JDBC-4.0 clarified "column name" to mean the label, as given in an "AS" clause and returned by ResultSetMetaData.getColumnLabel(), and if no AS clause, the column name. Setting this property to "true" will give behavior that is congruent to JDBC-3.0 and earlier versions of the JDBC specification, but which because of the specification bug could give unexpected results. This property is preferred over "useOldAliasesAsMetadataBehavior" unless you need the specific behavior that it provides with respect to ResultSetMetadata.	false	5.1.7
allowNanAndInf	Should the driver allow NaN or +/- INF values in PreparedStatement.setDouble()?	false	3.1.5
autoClosePstmtStreams	Should the driver automatically call .close() on streams/readers passed as arguments via set*() methods?	false	3.1.12
autoDeserialize	Should the driver automatically detect and de-serialize objects stored in BLOB fields?	false	3.1.5
blobsAreStrings	Should the driver always treat BLOBS as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
capitalizeTypeNames	Capitalize type names in DatabaseMetaData? (usually only useful when using WebObjects, true/false, defaults to 'false')	true	2.0.7
clobCharacterEncoding	The character encoding to use for sending and retrieving TEXT, MEDIUMTEXT and LONGTEXT values instead of the configured connection characterEncoding		5.0.0
clobberStreamingResults	This will cause a 'streaming' ResultSet to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.	false	3.0.9
compensateOnDuplicateKeyUpdateCounts	Should the driver compensate for the update counts of "ON DUPLICATE KEY" INSERT statements (2 = 1, 0 = 1) when using prepared statements?	false	5.1.7
continueBatchOnError	Should the driver continue processing batch commands if one statement fails. The JDBC spec allows either way (defaults to 'true').	true	3.0.3
createDatabaseIfNotExist	Creates the database given in the URL if it doesn't yet exist. Assumes the configured user has permissions to create databases.	false	3.1.9
emptyStringsConvertToZero	Should the driver allow conversions from empty string fields to numeric values of '0'?	true	3.1.8
emulateLocators	Should the driver emulate java.sql.Blobs with locators? With this feature enabled, the driver will delay loading the actual Blob data until the one of the retrieval methods (getInputStream(), getBytes(), and so forth) on the blob data stream has been accessed. For this to work, you must use a column alias with the value of the column to the actual name of the Blob. The feature also has the following restrictions: The SELECT that created the result set must reference only one table, the table must have a primary key; the SELECT must alias	false	3.1.0

	the original blob column name, specified as a string, to an alternate name; the SELECT must cover all columns that make up the primary key.		
emulateUnsupportedPstmts	Should the driver detect prepared statements that are not supported by the server, and replace them with client-side emulated versions?	true	3.1.7
exceptionInterceptors	Comma-delimited list of classes that implement com.mysql.jdbc.ExceptionInterceptor. These classes will be instantiated one per Connection instance, and all SQLExceptions thrown by the driver will be allowed to be intercepted by these interceptors, in a chained fashion, with the first class listed as the head of the chain.		5.1.8
functionsNeverReturnBlobs	Should the driver always treat data from functions returning BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
generateSimpleParameterMetadata	Should the driver generate simplified parameter metadata for PreparedStatements when no metadata is available either because the server couldn't support preparing the statement, or server-side prepared statements are disabled?	false	5.0.5
ignoreNonTxTables	Ignore non-transactional table warning for rollback? (defaults to 'false').	false	3.0.9
jdbcCompliantTruncation	This sets whether Connector/J should throw java.sql.DataTruncation exceptions when data is truncated. This is required by the JDBC specification when connected to a server that supports warnings (MySQL 4.1.0 and newer). This property has no effect if the server sql-mode includes STRICT_TRANS_TABLES. Note that if STRICT_TRANS_TABLES is not set, it will be set as a result of using this connection string option.	true	3.1.2
loadBalanceBlacklistTimeout	Time in milliseconds between checks of servers which are unavailable.	0	5.1.0
loadBalanceConnectionGroup	Logical group of load-balanced connections within a classloader, used to manage different groups independently. If not specified, live management of load-balanced connections is disabled.		5.1.13
loadBalanceExceptionChecker	Fully-qualified class name of custom exception checker. The class must implement com.mysql.jdbc.LoadBalanceExceptionChecker interface, and is used to inspect SQLExceptions and determine whether they should trigger fail-over to another host in a load-balanced deployment.	com.mysql.jdbc.StandardLoadBalanceExceptionChecker	5.1.13
loadBalancePingTimeout	Time in milliseconds to wait for ping response from each of load-balanced physical connections when using load-balanced Connection.	0	5.1.13
loadBalanceSQLExceptionSub-classFailover	Comma-delimited list of classes/interfaces used by default load-balanced exception checker to determine whether a given SQLException should trigger failover. The comparison is done using Class.isInstance(SQLException) using the thrown SQLException.		5.1.13
loadBalanceSQLStateFailover	Comma-delimited list of SQLState codes used by default load-balanced exception checker to determine whether a given SQLException should trigger failover. The SQLState of a given SQLException is evaluated to determine whether it begins with any value in the comma-delimited list.		5.1.13
loadBalanceValidateConnectionOn-SwapServer	Should the load-balanced Connection explicitly check whether the connection is live when swapping to a new physical connection at commit/rollback?	false	5.1.13
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions
netTimeoutForStreamingResults	What value should the driver automatically set the server setting 'net_write_timeout' to when the streaming result sets feature is in use? (value has unit of seconds, the value '0' means the driver	600	5.1.0

	will not try and adjust this value)		
noAccessToProcedureBodies	When determining procedure parameter types for CallableStatements, and the connected user can't access procedure bodies through "SHOW CREATE PROCEDURE" or select on mysql.proc should the driver instead create basic metadata (all parameters reported as IN VARCHARs, but allowing registerOutParameter() to be called on them anyway) instead of throwing an exception?	false	5.0.3
noDatetimeStringSync	Don't ensure that ResultSet.getDatetimeType().toString().equals(ResultSet.getString())	false	3.1.7
noTimezoneConversionForTimeType	Don't convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
nullCatalogMeansCurrent	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? When nullCatalogMeansCurrent is true the current catalog will be used if the catalog parameter is null. If nullCatalogMeansCurrent is false and the catalog parameter is null then the catalog parameter is not used to restrict the catalog search. (This is not JDBC-compliant, but follows legacy behavior from earlier versions of the driver)	true	3.1.8
nullNamePatternMatchesAll	Should DatabaseMetaData methods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
overrideSupportsIntegrityEnhancementFacility	Should the driver return "true" for DatabaseMetaData.supportsIntegrityEnhancementFacility() even if the database doesn't support it to workaround applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
padCharsWithSpace	If a result set column has the CHAR type and the value does not fill the amount of characters specified in the DDL for the column, should the driver pad the remaining characters with space (for ANSI compliance)?	false	5.0.6
pedantic	Follow the JDBC spec to the letter.	false	3.0.0
pinGlobalTxToPhysicalConnection	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
populateInsertRowWithDefaultValues	When using ResultSets that are CONCUR_UPDATABLE, should the driver pre-populate the "insert" row with default values from the DDL for the table used in the query so those values are immediately available for ResultSet accessors? This functionality requires a call to the database for metadata each time a result set of this type is created. If disabled (the default), the default values will be populated by the an internal call to refreshRow() which pulls back default values and/or values changed by triggers.	false	5.0.5
processEscapeCodesForPrepStmts	Should the driver process escape codes in queries that are prepared?	true	3.1.12
queryTimeoutKillsConnection	If the timeout given in Statement.setQueryTimeout() expires, should the driver forcibly abort the Connection instead of attempting to abort the query?	false	5.1.9
relaxAutoCommit	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
retainStatementAfterResultSetClose	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
rollbackOnPooledClose	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15

runningCTS13	Enables workarounds for bugs in Sun's JDBC compliance test-suite version 1.3	false	3.1.7
serverTimezone	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2
statementInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.StatementInterceptor" that should be placed "in between" query execution to influence the results. StatementInterceptors are "chainable", the results returned by the "current" interceptor will be passed on to the next in the chain, from left-to-right order, as specified in this property.		5.1.1
strictFloatingPoint	Used only in older versions of compliance test	false	3.0.0
strictUpdates	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
tinyInt1isBit	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16
transformedBitIsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
treatUtilDateAsTimestamp	Should the driver treat java.util.Date as a TIMESTAMP for the purposes of PreparedStatement.setObject()?	true	5.0.5
ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for _all_ statements? (true/false, defaults to 'false')	false	2.0.3
useAffectedRows	Don't set the CLIENT_FOUND_ROWS flag when connecting to the server (not JDBC-compliant, will break most applications that rely on "found" rows vs. "affected rows" for DML statements), but does cause "correct" update counts from "INSERT ... ON DUPLICATE KEY UPDATE" statements to be returned by the server.	false	5.1.7
useGmtMillisForDatedtimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior).	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in DatabaseMetaData.getColumn/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliantTimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "useTimezone=true" configuration option.)	false	5.0.0
useLegacyDatetimeCode	Use code for DATE/TIME/DATETIME/TIMESTAMP handling in result sets and statements that consistently handles timezone conversions from client to server and back again, or use the legacy code for these datatypes that has been in the driver for backwards-compatibility?	true	5.1.6
useOldAliasMetadataBehavior	Should the driver use the legacy behavior for "AS" clauses on columns and tables, and only return aliases (if any) for ResultSetMetaData.getColumnName() or ResultSetMetaData.getTableName() rather than the original column/table name? In 5.0.x, the default value was true.	false	5.0.4
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Don't prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useSSPSCompatibleTimezoneShift	If migrating from an environment that was using server-side prepared statements, and the configuration property "useJDBCCompliantTimeZoneShift" set to "true", use compatible beha-	false	5.0.5

	vior when not using server-side prepared statements when sending TIMESTAMP values to the MySQL server.		
useServerPrepStmts	Use server-side prepared statements if the server supports them?	false	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL state codes (true/false), default is 'true'	true	3.1.3
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2
useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2
useUnbufferedInput	Don't use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeros (used by MySQL to represent invalid dates)? Valid values are "exception", "round" and "convertToNull".	exception	3.1.4

Connector/J also supports access to MySQL using named pipes on Windows NT/2000/XP using the NamedPipeSocketFactory as a plugin-socket factory using the socketFactory property. If you do not use a namedPipePath property, the default of '\\.\pipe\MySQL' will be used. If you use the [NamedPipeSocketFactory](#), the host name and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access. However, this varies per system, and named pipes are slower than TCP/IP in many Windows configurations.

You can create your own socket factories by following the example code in [com.mysql.jdbc.NamedPipeSocketFactory](#), or [com.mysql.jdbc.StandardSocketFactory](#).

22.3.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification enables leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- **Blob**

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property 'emulateLocators=true' to your JDBC URL. Using this method, the driver will delay loading the actual Blob data until you retrieve the other data and then use retrieval methods ([getInputStream\(\)](#), [getBytes\(\)](#), and so forth) on the blob data stream.

For this to work, you must use a column alias with the value of the column to the actual name of the Blob, for example:

```
SELECT id, 'data' as blob_data from blobtable
```

For this to work, you must also follow these rules:

- The [SELECT](#) must also reference only one table, the table must have a primary key.
- The [SELECT](#) must alias the original blob column name, specified as a string, to an alternate name.
- The [SELECT](#) must cover all columns that make up the primary key.

The Blob implementation does not allow in-place modification (they are copies, as reported by the [DatabaseMetaData.locatorsUpdateCopies\(\)](#) method). Because of this, you should use the corresponding [PreparedStatement.setBlob\(\)](#) or [ResultSet.updateBlob\(\)](#) (in the case of updatable result sets) methods to save changes back to the database.

- **CallableStatement**

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer using the `CallableStatement` interface. Currently, the `getParameterMetaData()` method of `CallableStatement` is not supported.

- **Clob**

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setClob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- **Connection**

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is available. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- **DatabaseMetaData**

Foreign Key information (`getImportedKeys()`/`getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- **PreparedStatement**

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set using `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a nonlarge parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- During both server-side prepared statements and client-side emulation, large data is exchanged only when `PreparedStatement.execute()` is called.
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and cannot be read from again.
- If a parameter changes from large to nonlarge, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, using the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` method.

Consequently, if you want to change the type of a parameter to a nonlarge one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- **ResultSet**

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                           java.sql.ResultSet.CONCUR_READ_ONLY);
stmt.setFetchSize(Integer.MIN_VALUE);
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can is-

sue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be `MyISAM` table-level locks or row-level locks in some other storage engine such as `InnoDB`) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- **ResultSetMetaData**

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- **Statement**

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

Connector/J 5.0.0 and later include support for both `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL 5.0.0 or newer server, and require a separate connection to issue the `KILL QUERY` statement. In the case of `setQueryTimeout()`, the implementation creates an additional thread to handle the timeout functionality.

Note

Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeException` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so "setCursorName()" has no effect.

Connector/J 5.1.3 and later include two additional methods:

- `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.

22.3.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numeric type can be converted to any of the Java numeric types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

Connection Properties - Miscellaneous.

These MySQL Data Types	Can always be converted to these Java types
<code>CHAR</code> , <code>VARCHAR</code> , <code>BLOB</code> , <code>TEXT</code> , <code>ENUM</code> , and <code>SET</code>	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> ,

These MySQL Data Types	Can always be converted to these Java types
	<code>java.sql.Clob</code>
<code>FLOAT, REAL, DOUBLE PRECISION, NUMERIC, DECIMAL, TINYINT, SMALLINT, MEDIUMINT, INTEGER, BIGINT</code>	<code>java.lang.String, java.lang.Short, java.lang.Integer, java.lang.Long, java.lang.Double, java.math.BigDecimal</code>
<code>DATE, TIME, DATETIME, TIMESTAMP</code>	<code>java.lang.String, java.sql.Date, java.sql.Timestamp</code>

Note

Round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSetMetaData.GetColumnName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](#).

MySQL Types to Java Types for ResultSet.getObject().

MySQL Type Name	Return value of <code>GetColumnName</code>	Returned as Java Class
BIT(1) (new in MySQL-5.0)	BIT	<code>java.lang.Boolean</code>
BIT(> 1) (new in MySQL-5.0)	BIT	<code>byte[]</code>
TINYINT	TINYINT	<code>java.lang.Boolean</code> if the configuration property <code>tinyIntIsBit</code> is set to <code>true</code> (the default) and the storage size is 1, or <code>java.lang.Integer</code> if not.
BOOL, BOOLEAN	TINYINT	See TINYINT, above as these are aliases for TINYINT(1), currently.
SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]	<code>java.lang.Integer</code> (regardless if UNSIGNED or not)
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code> (C/J 3.1 and earlier), or <code>java.lang.Integer</code> for C/J 5.0 and later
INT,INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]	<code>java.lang.Long</code> , if UNSIGNED <code>java.math.BigInteger</code>
FLOAT[(M,D)]	FLOAT	<code>java.lang.Float</code>
DOUBLE[(M,B)]	DOUBLE	<code>java.lang.Double</code>
DECIMAL[(M[,D])]	DECIMAL	<code>java.math.BigDecimal</code>
DATE	DATE	<code>java.sql.Date</code>
DATETIME	DATETIME	<code>java.sql.Timestamp</code>
TIMESTAMP[(M)]	TIMESTAMP	<code>java.sql.Timestamp</code>
TIME	TIME	<code>java.sql.Time</code>
YEAR[(2 4)]	YEAR	If <code>yearIsDateType</code> configuration property is set to false, then the returned object type is <code>java.sql.Short</code> . If set to true (the default) then an object of type <code>java.sql.Date</code> (with the date set to January 1st, at midnight).
CHAR(M)	CHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned.)
VARCHAR(M) [BINARY]	VARCHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned.)
BINARY(M)	BINARY	<code>byte[]</code>
VARBINARY(M)	VARBINARY	<code>byte[]</code>
TINYBLOB	TINYBLOB	<code>byte[]</code>
TINYTEXT	VARCHAR	<code>java.lang.String</code>
BLOB	BLOB	<code>byte[]</code>

MySQL Type Name	Return value of <code>GetColumnName</code>	Returned as Java Class
TEXT	VARCHAR	<code>java.lang.String</code>
MEDIUMBLOB	MEDIUMBLOB	<code>byte[]</code>
MEDIUMTEXT	VARCHAR	<code>java.lang.String</code>
LONGBLOB	LONGBLOB	<code>byte[]</code>
LONGTEXT	VARCHAR	<code>java.lang.String</code>
ENUM('value1','value2',...)	CHAR	<code>java.lang.String</code>
SET('value1','value2',...)	CHAR	<code>java.lang.String</code>

22.3.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client character encoding, including all queries sent using `Statement.execute()`, `Statement.executeUpdate()`, `Statement.executeQuery()` as well as all `PreparedStatement` and `CallableStatement` parameters with the exclusion of parameters set using `setBytes()`, `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()` and `setBlob()`.

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the `useUnicode` and `characterEncoding` properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in `ResultSets`.

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server using the `character_set` system variable for server versions older than 4.1.0 and `character_set_server` for server versions 4.1.0 and newer. For more information, see [Section 9.1.3.1, “Server Character Set and Collation”](#).

To override the automatically detected encoding on the client side, use the `characterEncoding` property in the URL used to connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

MySQL to Java Encoding Name Translations.

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)
gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	Cp1252
latin2	ISO8859_2
greek	ISO8859_7
hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman

MySQL Character Set Name	Java-Style Character Encoding Name
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

Warning

Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed, and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

22.3.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The performance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.5.8, “Using SSL for Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

The system works through two Java truststore files, one file contains the certificate information for the server (`truststore` in the examples below). The other file contains the certificate for the client (`keystore` in the examples below). All Java truststore files are password protected by supplying a suitable password to the `keytool` when you create the files. You need the file names and associated passwords to create an SSL connection.

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the `SSL` subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server. Alternatively, use the CA Certificate that you have generated or been provided with by your SSL provider.

To use Java's `keytool` to create a truststore in the current directory , and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert \
               -file cacert.pem -keystore truststore
```

You will need to enter the password when prompted for the keystore file. Interaction with `keytool` will look like this:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=Walrus,
       O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=Walrus,
       O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Serial number: 0
Valid from:
   Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
   MD5: 61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
   SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You then have two options, you can either import the client certificate that matches the CA certificate you just imported, or you can create a new client certificate.

To import an existing certificate, the certificate should be in DER format. You can use `openssl` to convert an existing certificate into the new format. For example:

```
shell> openssl x509 -outform DER -in client-cert.pem -out client.cert
```

You now need to import the converted certificate into your keystore using `keytool`:

```
shell> keytool -import -file client.cert -keystore keystore -alias mysqlClientCertificate
```

To generate your own client certificate, use `keytool` to create a suitable certificate and add it to the `keystore` file:

```
shell> keytool -genkey -keyalg rsa \
    -alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named `keystore` in the current directory.

You should respond with information that is appropriate for your situation:

```
Enter keystore password: *****
What is your first and last name?
[Unknown]: Matthews
What is the name of your organizational unit?
[Unknown]: Software Development
What is the name of your organization?
[Unknown]: MySQL AB
What is the name of your City or Locality?
[Unknown]: Flossmoor
What is the name of your State or Province?
[Unknown]: IL
What is the two-letter country code for this unit?
[Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
L=Flossmoor, ST=IL, C=US> correct?
[no]: y

Enter key password for <mysqlClientCertificate>
  (RETURN if same as keystore password):
```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property. You can do this either on the command line:

```
-Djavax.net.ssl.keyStore=path_to_keystore_file
-Djavax.net.ssl.keyStorePassword=password
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=password
```

Or you can set the values directly within the application:

```
System.setProperty("javax.net.ssl.keyStore","path_to_keystore_file");
System.setProperty("javax.net.ssl.keyStorePassword","password");
System.setProperty("javax.net.ssl.trustStore","path_to_truststore_file");
System.setProperty("javax.net.ssl.trustStorePassword","password");
```

You will also need to set `useSSL` to `true` in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to `true` in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```
...

JSSE provides debugging (to STDOUT) when you set the following system property: `-Djavax.net.debug=all` This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

22.3.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write master, or a failover or round-robin loadbalanced set of slaves based on the state of `Connection.getReadOnly()`.

An application signals that it wants a transaction to be read-only by calling `Connection.setReadOnly(true)`, this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling `Connection.setReadOnly(false)` and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of autocommit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "`com.mysql.jdbc.ReplicationDriver`" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, `ReplicationDriver` does not currently work with `java.sql.DriverManager`-based connection creation unless it is the only MySQL JDBC driver registered with the `DriverManager`.

Here is a short, simple example of how `ReplicationDriver` might be used in a standalone application.

```

import java.sql.Connection;
import java.sql.ResultSet;
import java.util.Properties;

import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

    public static void main(String[] args) throws Exception {
        ReplicationDriver driver = new ReplicationDriver();

        Properties props = new Properties();
        // We want this for failover on the slaves
        props.put("autoReconnect", "true");

        // We want to load balance between the slaves
        props.put("roundRobinLoadBalance", "true");

        props.put("user", "foo");
        props.put("password", "bar");

        //
        // Looks like a normal MySQL JDBC url, with a
        // comma-separated list of hosts, the first
        // being the 'master', the rest being any number
        // of slaves that the driver will load balance against
        //

        Connection conn =
            driver.connect("jdbc:mysql:replication://master,slave1,slave2,slave3/test",
                           props);

        //
        // Perform read/write work on the master
        // by setting the read-only flag to "false"
        //

        conn.setReadOnly(false);
        conn.setAutoCommit(false);
        conn.createStatement().executeUpdate("UPDATE some_table ....");
        conn.commit();

        //
        // Now, do a query from a slave, the driver automatically picks one
        // from the list
        //

```

```

    //
    conn.setReadOnly(true);

    ResultSet rs =
        conn.createStatement().executeQuery("SELECT a,b FROM alt_table");

    }      .....
}

```

You may also want to investigate the Load Balancing JDBC Pool (lbp0l) tool, which provides a wrapper around the standard JDBC driver and enables you to use DB connection pools that includes checks for system failures and uneven load distribution. For more information, see [Load Balancing JDBC Pool \(lbp0l\)](#).

22.3.4.7. Mapping MySQL Error Numbers to SQLStates

The table below provides a mapping of the MySQL Error Numbers to [SQL States](#)

22.3.5. Connector/J Notes and Tips

22.3.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

22.3.5.1.1. Connecting to MySQL Using the `DriverManager` Interface

When you are using JDBC outside of an application server, the `DriverManager` class manages the establishment of Connections.

The `DriverManager` needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use `Class.forName()` on the class that implements the `java.sql.Driver` interface. With MySQL Connector/J, the name of this class is `com.mysql.jdbc.Driver`. With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the `main()` method of your application. If testing this code please ensure you read the installation section first at [Section 22.3.2, “Connector/J Installation”](#), to make sure you have connector installed correctly and the `CLASSPATH` set up. Also, ensure that MySQL is configured to accept external TCP/IP connections.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
    public static void main(String[] args) {
        try {
            // The newInstance() call is a work around for some
            // broken Java implementations
            Class.forName("com.mysql.jdbc.Driver").newInstance();
        }
    }
}
```

```

        } catch (Exception ex) {
            // handle the error
        }
    }
}

```

After the driver has been registered with the `DriverManager`, you can obtain a `Connection` instance that is connected to a particular database by calling `DriverManager.getConnection()`:

Example 22.1. Connector/J: Obtaining a connection from the `DriverManager`

If you have not already done so, please review the section [Section 22.3.5.1.1, “Connecting to MySQL Using the `DriverManager` Interface”](#) before working with these examples.

This example shows how you can obtain a `Connection` instance from the `DriverManager`. There are a few different signatures for the `getConnection()` method. You should see the API documentation that comes with your JDK for more specific information on how to use them.

```

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

Connection conn = null;
...
try {
    conn =
        DriverManager.getConnection("jdbc:mysql://localhost/test?" +
                                   "user=monty&password=greatsqldb");

    // Do something with the Connection

    ...
} catch (SQLException ex) {
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}

```

Once a `Connection` is established, it can be used to create `Statement` and `PreparedStatement` objects, as well as retrieve metadata about the database. This is explained in the following sections.

22.3.5.1.2. Using Statements to Execute SQL

`Statement` objects allow you to execute basic SQL queries and retrieve the results through the `ResultSet` class which is described later.

To create a `Statement` instance, you call the `createStatement()` method on the `Connection` object you have retrieved using one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a `Statement` instance, you can execute a `SELECT` query by calling the `executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows matched by the update statement, not the number of rows that were modified.

If you do not know ahead of time whether the SQL statement will be a `SELECT` or an `UPDATE/INSERT`, then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a `SELECT`, or false if it was an `UPDATE`, `INSERT`, or `DELETE` statement. If the statement was a `SELECT` query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an `UPDATE`, `INSERT`, or `DELETE` statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the `Statement` instance.

Example 22.2. Connector/J: Using `java.sql.Statement` to execute a `SELECT` query

```

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.sql.Statement;
import java.sql.ResultSet;

// assume that conn is an already created JDBC connection (see previous examples)

Statement stmt = null;
ResultSet rs = null;

```

```

try {
    stmt = conn.createStatement();
    rs = stmt.executeQuery("SELECT foo FROM bar");

    // or alternatively, if you don't know ahead of time that
    // the query will be a SELECT...
    if (stmt.execute("SELECT foo FROM bar")) {
        rs = stmt.getResultSet();
    }

    // Now do something with the ResultSet ....
}
catch (SQLException ex){
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}
finally {
    // it is a good idea to release
    // resources in a finally{} block
    // in reverse-order of their creation
    // if they are no-longer needed

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) { } // ignore
        rs = null;
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlEx) { } // ignore
        stmt = null;
    }
}

```

22.3.5.1.3. Using `CallableStatements` to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

For more information on MySQL stored procedures, please refer to <http://dev.mysql.com/doc/mysql/en/stored-routines.html>.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

Note

Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in using `inputParam` as a `ResultSet`:

Example 22.3. Connector/J: Calling Stored Procedures

```

CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), \
                      INOUT inOutParam INT)
BEGIN
    DECLARE z INT;
    SET z = inOutParam + 1;
    SET inOutParam = z;

    SELECT inputParam;

    SELECT CONCAT('zyxw', inputParam);
END

```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not op-

tional:

Example 22.4. Connector/J: Using `Connection.prepareCall()`

```
import java.sql.CallableStatement;
...
/*
// Prepare a call to the stored procedure 'demoSp'
// with two parameters
//
// Notice the use of JDBC-escape syntax ({call ...})
*/
CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

cStmt.setString(1, "abcdefg");
```

Note

`Connection.prepareCall()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareCall()` by reusing `CallableStatement` instances in your code.

2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

Example 22.5. Connector/J: Registering output parameters

```
import java.sql.Types;
...
/*
// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
*/

/*
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//

cStmt.registerOutParameter(2, Types.INTEGER);

/*
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//

cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...
```

3. Set the input parameters (if any exist)

Input and in/out parameters are set as for `PreparedStatement` objects. However, `CallableStatement` also supports setting parameters by name:

Example 22.6. Connector/J: Setting `CallableStatement` input parameters

```
...
```

```

/*
// Set a parameter by index
//
cStmt.setString(1, "abcdefg");

/*
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");

/*
// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);

/*
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);
...

```

4. Execute the `CallableStatement`, and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `executeQuery()` or `execute()`), the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

Example 22.7. Connector/J: Retrieving results and output parameter values

```

...
boolean hadResults = cStmt.execute();

/*
// Process all returned result sets
//

while (hadResults) {
    ResultSet rs = cStmt.getResultSet();
    // process result set
    ...

    hadResults = cStmt.getMoreResults();
}

/*
// Retrieve output parameters
//
// Connector/J supports both index-based and
// name-based retrieval
//

int outputValue = cStmt.getInt(2); // index-based
outputValue = cStmt.getInt("inOutParam"); // name-based
...

```

22.3.5.1.4. Retrieving `AUTO_INCREMENT` Column Values

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

Example 22.8. Connector/J: Retrieving AUTO_INCREMENT column values using Statement.getGeneratedKeys()

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets assuming you have a
    // Connection 'conn' to a MySQL database already
    // available

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                               java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial (
            + "priKey INT NOT NULL AUTO_INCREMENT,
            + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')",
        Statement.RETURN_GENERATED_KEYS);

    //
    // Example of using Statement.getGeneratedKeys()
    // to retrieve the value of an auto-increment
    // value
    //

    int autoIncKeyFromApi = -1;
    rs = stmt.getGeneratedKeys();

    if (rs.next()) {
        autoIncKeyFromApi = rs.getInt(1);
    } else {
        // throw an exception from here
    }

    rs.close();
    rs = null;

    System.out.println("Key returned from getGeneratedKeys():"
        + autoIncKeyFromApi);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 22.9. Connector/J: Retrieving AUTO_INCREMENT column values using SELECT LAST_INSERT_ID()

```

Statement stmt = null;
ResultSet rs = null;

try {
    //

```

```

// Create a Statement instance that we can use for
// 'normal' result sets.
stmt = conn.createStatement();

//
// Issue the DDL queries for the table for this example
//

stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
stmt.executeUpdate(
    "CREATE TABLE autoIncTutorial (" +
    + "priKey INT NOT NULL AUTO_INCREMENT, " +
    + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

//
// Insert one row that will generate an AUTO INCREMENT
// key in the 'priKey' field
//

stmt.executeUpdate(
    "INSERT INTO autoIncTutorial (dataField) " +
    + "values ('Can I Get the Auto Increment Field?')");

//
// Use the MySQL LAST_INSERT_ID()
// function to do the same thing as getGeneratedKeys()
//

int autoIncKeyFromFunc = -1;
rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

if (rs.next()) {
    autoIncKeyFromFunc = rs.getInt(1);
} else {
    // throw an exception from here
}

rs.close();

System.out.println("Key returned from " +
    "'SELECT LAST_INSERT_ID()' : " +
    autoIncKeyFromFunc);

} finally {

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 22.10. Connector/J: Retrieving AUTO_INCREMENT column values in Updatable ResultSets

```

Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets as well as an 'updatable'
    // one, assuming you have a Connection 'conn' to
    // a MySQL database already available
    //

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                               java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial (" +
        + "priKey INT NOT NULL AUTO_INCREMENT, " +
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");
}

```

```

// Example of retrieving an AUTO INCREMENT key
// from an updatable result set
//

rs = stmt.executeQuery("SELECT priKey, dataField "
+ "FROM autoIncTutorial");

rs.moveToInsertRow();

rs.updateString("dataField", "AUTO INCREMENT here?");
rs.insertRow();

//
// the driver adds rows at the end
//

rs.last();

//
// We should now be on the row we just inserted
//

int autoIncKeyFromRS = rs.getInt("priKey");

rs.close();

rs = null;

System.out.println("Key returned for inserted row: "
+ autoIncKeyFromRS);

} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries happen on the same connection, but not on the same `Statement` instance.

22.3.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

22.3.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

22.3.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transaction, the connection would otherwise sit idle. Instead, connection pooling enables the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you do not use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it through the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

Example 22.11. Connector/J: Using a connection pool with a J2EE application server

```
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {
    public void doSomething() throws Exception {
        /*
         * Create a JNDI Initial context to be able to
         * lookup the DataSource
         *
         * In production-level code, this should be cached as
         * an instance or static variable, as it can
         * be quite expensive to create a JNDI context.
         *
         * Note: This code only works when you are using servlets
         * or EJBs in a J2EE application server. If you are
         * using connection pooling in standalone Java code, you
         * will have to create/configure datasources using whatever
         * mechanisms your particular connection pooling library
         * provides.
         */
        InitialContext ctx = new InitialContext();

        /*
         * Lookup the DataSource, which will be backed by a pool
         * that the application server provides. DataSource instances
         * are also a good candidate for caching as an instance
         * variable, as JNDI lookups can be expensive as well.
         */
        DataSource ds =
            (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

        /*
         * The following code is what would actually be in your
         */
    }
}
```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

What Is the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users) using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

Validating Connections

MySQL Connector/J has the ability to execute a lightweight ping against a server, in order to validate the connection. In the case of load-balanced connections, this is performed against all active pooled internal connections that are retained. This is beneficial to Java applications using connection pools, as the pool can use this feature to validate connections. Depending on your connection pool and configuration, this validation can be carried out at different times:

1. Before the pool returns a connection to the application.
2. When the application returns a connection to the pool.
3. During periodic checks of idle connections.

In order to use this feature you need to specify a validation query in your connection pool that starts with `/* ping */`. Note the syntax must be exactly as specified. This will cause the driver send a ping to the server and return a fake, light-weight, result set. When using a `ReplicationConnection` or `LoadBalancedConnection`, the ping will be sent across all active connections.

It is critical that the syntax be specified correctly. For example, consider the following snippets:

```
sql = "/* PING */ SELECT 1";
sql = "SELECT 1 /* ping */";
sql = "/*ping*/ SELECT 1";
sql = " /* ping */ SELECT 1";
sql = "/*to ping or not to ping*/ SELECT 1";
```

None of the above statements will work. This is because the ping syntax is sensitive to whitespace, capitalization, and placement. The syntax needs to be exact for reasons of efficiency, as this test is done for every statement that is executed:

```
protected static final String PING_MARKER = "/* ping */";
...
if (sql.charAt(0) == '/') {
if (sql.startsWith(PING_MARKER)) {
doPingInstead();
...
}
```

All of the previous statements will issue a normal `SELECT` statement and will **not** be transformed into the lightweight ping. Further, for load-balanced connections the statement will be executed against one connection in the internal pool, rather than validating each underlying physical connection. This results in the non-active physical connections assuming a stale state, and they may die. If Connector/J then re-balances it may select a dead connection, resulting in an exception being passed to the application. To help prevent this you can use `loadBalanceValidateConnectionOnSwapServer` to validate the connection before use.

If your Connector/J deployment uses a connection pool that allows you to specify a validation query, this should be taken advantage of, but ensure that the query starts *exactly* with `/* ping */`. This is particularly important if you are using the load-balancing or replication-aware features of Connector/J, as it will help keep alive connections which otherwise will go stale and die, causing problems later.

22.3.5.2.1.2. Managing Load Balanced Connections

Connector/J has long provided an effective means to distribute read/write load across multiple MySQL server instances for Cluster or master-master replication deployments, but until version 5.1.13, managing such deployments frequently required a service outage to redeploy a new configuration. Given that the ease of scaling out by adding additional MySQL Cluster (server) instances is a key element in that product offering, which is also naturally targeted at deployments with very strict availability requirements, it was necessary to add support for online changes of this nature. This is also critical for online upgrades, as the alternative is to take a MySQL Cluster server instance down hard, which will lose any in-process transactions and will also generate application exceptions, if any application is trying to use that particular server instance. Connector/J now has the ability to dynamically configure load-balanced connections.

There are two connection string options associated with this functionality:

- `loadBalanceConnectionGroup` – This provides the ability to group connections from different sources. This allows you to manage these JDBC sources within a single class-loader in any combination you choose. If they use the same configuration, and you want to manage them as a logical single group, give them the same name. This is the key property for management, if you do not define a name (string) for `loadBalanceConnectionGroup`, you cannot manage the connections. All load-balanced connections sharing the same `loadBalanceConnectionGroup` value, regardless of how the application creates them, will be managed together.
- `loadBalanceEnableJMX` – The ability to manage the connections is exposed when you define a `loadBalanceConnectionGroup`, but if you want to manage this externally, it is necessary to enable JMX by setting this property to `true`. This enables a JMX implementation, which exposes the management and monitoring operations of a connection group. Further, you need to start your application with the `-Dcom.sun.management.jmxremote` JVM flag. You can then perform connect and perform operations using a JMX client such as `jconsole`.

Once a connection has been made using the correct connection string options, a number of monitoring properties are available:

- Current active host count
- Current active physical connection count
- Current active logical connection count
- Total logical connections created
- Total transaction count

The following management operations can also be performed:

- Add host
- Remove host

The JMX interface, `com.mysql.jdbc.jmx.LoadBalanceConnectionGroupManagerMBean`, has the following methods:

- `int getActiveHostCount(String group);`
- `int getTotalHostCount(String group);`
- `long getTotalLogicalConnectionCount(String group);`
- `long getActiveLogicalConnectionCount(String group);`
- `long getTotalPhysicalConnectionCount(String group);`
- `long getActivePhysicalConnectionCount(String group);`
- `long getTotalTransactionCount(String group);`
- `void removeHost(String group, String host) throws SQLException;`
- `void stopNewConnectionsToHost(String group, String host) throws SQLException;`
- `void addHost(String group, String host, boolean forExisting);`
- `String getActiveHostsList(String group);`
- `String getRegisteredConnectionGroups();`

The `getRegisteredConnectionGroups()` method will return the names of all connection groups defined in that class-loader.

You can test this setup with the following code:

```
public class Test {  
    private static String URL = "jdbc:mysql:loadbalance://" +  
        "localhost:3306,localhost:3310/test?" +  
        "loadBalanceConnectionGroup=first&loadBalanceEnableJMX=true";  
  
    public static void main(String[] args) throws Exception {  
        new Thread(new Repeater()).start();  
        new Thread(new Repeater()).start();  
        new Thread(new Repeater()).start();  
    }  
  
    static Connection getConnection() throws SQLException, ClassNotFoundException {  
        Class.forName("com.mysql.jdbc.Driver");  
        return DriverManager.getConnection(URL, "root", "");  
    }  
  
    static void executeSimpleTransaction(Connection c, int conn, int trans){  
        try {  
            c.setAutoCommit(false);  
            Statement s = c.createStatement();  
            s.executeQuery("SELECT SLEEP(1) /* Connection: " + conn + ", transaction: " + trans + " */");  
            c.commit();  
        } catch (SQLException e) {  
            e.printStackTrace();  
        }  
    }  
}
```

```

    }

    public static class Repeater implements Runnable {
        public void run() {
            for(int i=0; i < 100; i++){
                try {
                    Connection c = getNewConnection();
                    for(int j=0; j < 10; j++){
                        executeSimpleTransaction(c, i, j);
                        Thread.sleep(Math.round(100 * Math.random()));
                    }
                    c.close();
                    Thread.sleep(100);
                } catch (Exception e) {
                    e.printStackTrace();
                }
            }
        }
    }
}

```

After compiling, the application can be started with the `-Dcom.sun.management.jmxremote` flag, to enable remote management. `jconsole` can then be started. The Test main class will be listed by `jconsole`. Select this and click CONNECT. You can then navigate to the `com.mysql.jdbc.jmx.LoadBalanceConnectionGroupManager` bean. At this point you can click on various operations and examine the returned result.

If you now had an additional instance of MySQL running on port 3309, you could ensure that Connector/J starts using it by using the `addHost()`, which is exposed in `jconsole`. Note that these operations can be performed dynamically without having to stop the application running.

22.3.5.2.1.3. Load Balancing Failover Policies

Connector/J provides a useful load-balancing implementation for Cluster or multi-master deployments. As of Connector/J 5.1.12, this same implementation is used for balancing load between read-only slaves with `ReplicationDriver`. When trying to balance workload between multiple servers, the driver has to determine when it is safe to swap servers, doing so in the middle of a transaction, for example, could cause problems. It is important not to lose state information. For this reason, Connector/J will only try to pick a new server when one of the following happens:

1. At transaction boundaries (transactions are explicitly committed or rolled back).
2. A communication exception (SQL State starting with "08") is encountered.
3. When a `SQLException` matches conditions defined by user, using the extension points defined by the `loadBalanceSQLStateFailover`, `loadBalanceSQLExceptionSubclassFailover` or `loadBalanceExceptionChecker` properties.

The third condition revolves around three new properties introduced with Connector/J 5.1.13. It allows you to control which `SQLExceptions` trigger failover.

- `loadBalanceExceptionChecker` - The `loadBalanceExceptionChecker` property is really the key. This takes a fully-qualified class name which implements the new `com.mysql.jdbc.LoadBalanceExceptionChecker` interface. This interface is very simple, and you only need to implement the following method:

```
public boolean shouldExceptionTriggerFailover(SQLException ex)
```

A `SQLException` is passed in, and a boolean returned. `True` triggers a failover, `false` does not.

You can use this to implement your own custom logic. An example where this might be useful is when dealing with transient errors when using MySQL Cluster, where certain buffers may become overloaded. The following code snippet illustrates this:

```

public class NdbLoadBalanceExceptionChecker
    extends StandardLoadBalanceExceptionChecker {

    public boolean shouldExceptionTriggerFailover(SQLException ex) {
        return super.shouldExceptionTriggerFailover(ex)
            || checkNdbException(ex);
    }

    private boolean checkNdbException(SQLException ex){
        // Have to parse the message since most NDB errors
        // are mapped to the same DEMC.
        return (ex.getMessage().startsWith("Lock wait timeout exceeded") ||
            (ex.getMessage().startsWith("Got temporary error") &&
            && ex.getMessage().endsWith("from NDB")));
    }
}

```

```
}
```

The code above extends `com.mysql.jdbc.StandardLoadBalanceExceptionChecker`, which is the default implementation. There are a few convenient shortcuts built into this, for those who want to have some level of control using properties, without writing Java code. This default implementation uses the two remaining properties: `loadBalanceSQLStateFailover` and `loadBalanceSQLExceptionSubclassFailover`.

- `loadBalanceSQLStateFailover` - allows you to define a comma-delimited list of `SQLState` code prefixes, against which a `SQLException` is compared. If the prefix matches, failover is triggered. So, for example, the following would trigger a failover if a given `SQLException` starts with "00", or is "12345":

```
loadBalanceSQLStateFailover=00,12345
```

- `loadBalanceSQLExceptionSubclassFailover` - can be used in conjunction with `loadBalanceSQLStateFailover` or on its own. If you want certain subclasses of `SQLException` to trigger failover, simply provide a comma-delimited list of fully-qualified class or interface names to check against. For example, if you want all `SQLTransientConnectionExceptions` to trigger failover, you would specify:

```
loadBalanceSQLExceptionSubclassFailover=java.sql.SQLTransientConnectionException
```

While the three fail-over conditions enumerated earlier suit most situations, if `auto-commit` is enabled, Connector/J never re-balances, and continues using the same physical connection. This can be problematic, particularly when load-balancing is being used to distribute read-only load across multiple slaves. However, Connector/J can be configured to re-balance after a certain number of statements are executed, when `auto-commit` is enabled. This functionality is dependent upon the following properties:

- `loadBalanceAutoCommitStatementThreshold` – defines the number of matching statements which will trigger the driver to potentially swap physical server connections. The default value, 0, retains the behavior that connections with `auto-commit` enabled are never balanced.
- `loadBalanceAutoCommitStatementRegex` – the regular expression against which statements must match. The default value, blank, matches all statements. So, for example, using the following properties will cause Connector/J to re-balance after every third statement that contains the string “test”:

```
loadBalanceAutoCommitStatementThreshold=3
loadBalanceAutoCommitStatementRegex=.*test.*
```

`loadBalanceAutoCommitStatementRegex` can prove useful in a number of situations. Your application may use temporary tables, server-side session state variables, or connection state, where letting the driver arbitrarily swap physical connections before processing is complete could cause data loss or other problems. This allows you to identify a trigger statement that is only executed when it is safe to swap physical connections.

22.3.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://tomcat.apache.org/tomcat-5.5-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `$CATALINA_HOME/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to `$CATALINA_HOME/conf/server.xml` in the context that defines your web application:

```
<Context ....>
  ...
<Resource name="jdbc/MySQLDB"
          auth="Container"
          type="javax.sql.DataSource"/>
<!-- The name you used above, must match _exactly_ here!
The connection pool will be bound into JNDI with the name
"java:/comp/env/jdbc/MySQLDB"
--&gt;
&lt;ResourceParams name="jdbc/MySQLDB"&gt;</pre>

```

```

<parameter>
  <name>factory</name>
  <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
</parameter>

<!-- Don't set this any higher than max_connections on your
     MySQL server, usually this should be a 10 or a few 10's
     of connections, not hundreds or thousands -->

<parameter>
  <name>maxActive</name>
  <value>10</value>
</parameter>

<!-- You don't want to many idle connections hanging around
     if you can avoid it, only enough to soak up a spike in
     the load -->

<parameter>
  <name>maxIdle</name>
  <value>5</value>
</parameter>

<!-- Don't use autoReconnect=true, it's going away eventually
     and it's a crutch for older connection pools that couldn't
     test connections. You need to decide whether your application
     is supposed to deal with SQLExceptions (hint, it should), and
     how much of a performance penalty you're willing to pay
     to ensure 'freshness' of the connection -->

<parameter>
  <name>validationQuery</name>
  <value>SELECT 1</value> <-- See discussion below for update to this option -->
</parameter>

<!-- The most conservative approach is to test connections
     before they're given to your application. For most applications
     this is okay, the query used above is very small and takes
     no real server resources to process, other than the time used
     to traverse the network.

     If you have a high-load application you'll need to rely on
     something else. -->

<parameter>
  <name>testOnBorrow</name>
  <value>true</value>
</parameter>

<!-- Otherwise, or in addition to testOnBorrow, you can test
     while connections are sitting idle -->

<parameter>
  <name>testWhileIdle</name>
  <value>true</value>
</parameter>

<!-- You have to set this value, otherwise even though
     you've asked connections to be tested while idle,
     the idle evicter thread will never run -->

<parameter>
  <name>timeBetweenEvictionRunsMillis</name>
  <value>10000</value>
</parameter>

<!-- Don't allow connections to hang out idle too long,
     never longer than what wait_timeout is set to on the
     server...A few minutes or even fraction of a minute
     is sometimes okay here, it depends on your application
     and how much spiky load it will see -->

<parameter>
  <name>minEvictableIdleTimeMillis</name>
  <value>60000</value>
</parameter>

<!-- Username and password used when connecting to MySQL -->

<parameter>
  <name>username</name>
  <value>someuser</value>
</parameter>

<parameter>
  <name>password</name>
  <value>somepass</value>
</parameter>

<!-- Class name for the Connector/J driver -->

<parameter>
  <name>driverClassName</name>
  <value>com.mysql.jdbc.Driver</value>
</parameter>

<!-- The JDBC connection url for connecting to MySQL, notice

```

```

that if you want to pass any other MySQL-specific parameters
you should pass them here in the URL, setting them using the
parameter tags above will have no effect, you will also
need to use & to separate parameter values as the
ampersand is a reserved character in XML -->

<parameter>
  <name>url</name>
  <value>jdbc:mysql://localhost:3306/test</value>
</parameter>

</ResourceParams>
</Context>

```

Note that Connector/J 5.1.3 introduced a facility whereby, rather than use a `validationQuery` value of `SELECT 1`, it is possible to use `validationQuery` with a value set to `/* ping */`. This sends a ping to the server which then returns a fake result set. This is a lighter weight solution. It also has the advantage that if using `ReplicationConnection` or `LoadBalancedConnection` type connections, the ping will be sent across all active connections. The following XML snippet illustrates how to select this option:

```

<parameter>
  <name>validationQuery</name>
  <value>/* ping */</value>
</parameter>

```

Note that `/* ping */` has to be specified exactly.

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure data-sources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```
Error: java.sql.SQLException: Cannot load JDBC driver class 'null' SQL
state: null
```

22.3.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the `lib` directory for your server configuration (which is usually called `default`). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasource configuration file that ends with `"-ds.xml"`, which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```

<datasources>
  <local-tx-datasource>
    <!-- This connection pool will be bound into JNDI with the name
        "java:/MySQLDB" -->

    <jndi-name>MySQLDB</jndi-name>
    <connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
    <driver-class>com.mysql.jdbc.Driver</driver-class>
    <user-name>user</user-name>
    <password>pass</password>

    <min-pool-size>5</min-pool-size>

    <!-- Don't set this any higher than max_connections on your
        MySQL server, usually this should be a 10 or a few 10's
        of connections, not hundreds or thousands -->

    <max-pool-size>20</max-pool-size>

    <!-- Don't allow connections to hang out idle too long,
        never longer than what wait_timeout is set to on the
        server...A few minutes is usually okay here,
        it depends on your application
        and how much spiky load it will see -->

    <idle-timeout-minutes>5</idle-timeout-minutes>

    <!-- If you're using Connector/J 3.1.8 or newer, you can use
        our implementation of these to increase the robustness
        of the connection pool. -->

    <exception-sorter-class-name>
      com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter
    </exception-sorter-class-name>
    <valid-connection-checker-class-name>
      com.mysql.jdbc.integration.jboss.MysqlValidConnectionChecker
    </valid-connection-checker-class-name>

  </local-tx-datasource>
</datasources>

```

22.3.5.2.4. Using Connector/J with Spring

The Spring Framework is a Java-based application framework designed for assisting in application design by providing a way to configure components. The technique used by Spring is a well known design pattern called Dependency Injection (see [Inversion of Control Containers and the Dependency Injection pattern](#)). This article will focus on Java-oriented access to MySQL databases with Spring 2.0. For those wondering, there is a .NET port of Spring appropriately named Spring.NET.

Spring is not only a system for configuring components, but also includes support for aspect oriented programming (AOP). This is one of the main benefits and the foundation for Spring's resource and transaction management. Spring also provides utilities for integrating resource management with JDBC and Hibernate.

For the examples in this section the MySQL world sample database will be used. The first task is to set up a MySQL data source through Spring. Components within Spring use the "bean" terminology. For example, to configure a connection to a MySQL server supporting the world sample database you might use:

```
<util:map id="dbProps">
    <entry key="db.driver" value="com.mysql.jdbc.Driver"/>
    <entry key="db.jdbcurl" value="jdbc:mysql://localhost/world"/>
    <entry key="db.username" value="myuser"/>
    <entry key="db.password" value="mypass"/>
</util:map>
```

In the above example we are assigning values to properties that will be used in the configuration. For the datasource configuration:

```
<bean id="dataSource"
      class="org.springframework.jdbc.datasource.DriverManagerDataSource">
    <property name="driverClassName" value="${db.driver}"/>
    <property name="url" value="${db.jdbcurl}"/>
    <property name="username" value="${db.username}"/>
    <property name="password" value="${db.password}"/>
</bean>
```

The placeholders are used to provide values for properties of this bean. This means that you can specify all the properties of the configuration in one place instead of entering the values for each property on each bean. We do, however, need one more bean to pull this all together. The last bean is responsible for actually replacing the placeholders with the property values.

```
<bean
  class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
  <property name="properties" ref="dbProps"/>
</bean>
```

Now that we have our MySQL data source configured and ready to go, we write some Java code to access it. The example below will retrieve three random cities and their corresponding country using the data source we configured with Spring.

```
// Create a new application context. this processes the Spring config
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("ex1appContext.xml");
// Retrieve the data source from the application context
DataSource ds = (DataSource) ctx.getBean("dataSource");
// Open a database connection using Spring's DataSourceUtils
Connection c = DataSourceUtils.getConnection(ds);
try {
    // retrieve a list of three random cities
    PreparedStatement ps = c.prepareStatement(
        "select City.Name as 'City', Country.Name as 'Country' " +
        "from City inner join Country on City.CountryCode = Country.Code " +
        "order by rand() limit 3");
    ResultSet rs = ps.executeQuery();
    while(rs.next()) {
        String city = rs.getString("City");
        String country = rs.getString("Country");
        System.out.printf("The city %s is in %s%n", city, country);
    }
} catch (SQLException ex) {
    // something has failed and we print a stack trace to analyse the error
    ex.printStackTrace();
    // ignore failure closing connection
    try { c.close(); } catch (SQLException e) { }
} finally {
    // properly release our connection
    DataSourceUtils.releaseConnection(c, ds);
}
```

This is very similar to normal JDBC access to MySQL with the main difference being that we are using `DataSourceUtils` instead of the `DriverManager` to create the connection.

While it may seem like a small difference, the implications are somewhat far reaching. Spring manages this resource in a way sim-

ilar to a container managed data source in a J2EE application server. When a connection is opened, it can be subsequently accessed in other parts of the code if it is synchronized with a transaction. This makes it possible to treat different parts of your application as transactional instead of passing around a database connection.

22.3.5.2.4.1. Using `JdbcTemplate`

Spring makes extensive use of the Template method design pattern (see [Template Method Pattern](#)). Our immediate focus will be on the `JdbcTemplate` and related classes, specifically `NamedParameterJdbcTemplate`. The template classes handle obtaining and releasing a connection for data access when one is needed.

The next example shows how to use `NamedParameterJdbcTemplate` inside of a DAO (Data Access Object) class to retrieve a random city given a country code.

```
public class Ex2JdbcDao {
    /**
     * Data source reference which will be provided by Spring.
     */
    private DataSource dataSource;

    /**
     * Our query to find a random city given a country code. Notice
     * the ":country" parameter toward the end. This is called a
     * named parameter.
     */
    private String queryString = "select Name from City " +
        "where CountryCode = :country order by rand() limit 1";

    /**
     * Retrieve a random city using Spring JDBC access classes.
     */
    public String getRandomCityByCountryCode(String cntryCode) {
        // A template that permits using queries with named parameters
        NamedParameterJdbcTemplate template =
            new NamedParameterJdbcTemplate(dataSource);
        // A java.util.Map is used to provide values for the parameters
        Map params = new HashMap();
        params.put("country", cntryCode);
        // We query for an Object and specify what class we are expecting
        return (String)template.queryForObject(queryString, params, String.class);
    }

    /**
     * A JavaBean setter-style method to allow Spring to inject the data source.
     * @param dataSource
     */
    public void setDataSource(DataSource dataSource) {
        this.dataSource = dataSource;
    }
}
```

The focus in the above code is on the `getRandomCityByCountryCode()` method. We pass a country code and use the `NamedParameterJdbcTemplate` to query for a city. The country code is placed in a Map with the key "country", which is the parameter is named in the SQL query.

To access this code, you need to configure it with Spring by providing a reference to the data source.

```
<bean id="dao" class="code.Ex2JdbcDao">
    <property name="dataSource" ref="dataSource"/>
</bean>
```

At this point, we can just grab a reference to the DAO from Spring and call `getRandomCityByCountryCode()`.

```
// Create the application context
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("ex2appContext.xml");
// Obtain a reference to our DAO
Ex2JdbcDao dao = (Ex2JdbcDao) ctx.getBean("dao");

String countryCode = "USA";

// Find a few random cities in the US
for(int i = 0; i < 4; ++i)
    System.out.printf("A random city in %s is %s%n", countryCode,
        dao.getRandomCityByCountryCode(countryCode));
```

This example shows how to use Spring's JDBC classes to completely abstract away the use of traditional JDBC classes including `Connection` and `PreparedStatement`.

22.3.5.2.4.2. Transactional JDBC Access

You might be wondering how we can add transactions into our code if we do not deal directly with the JDBC classes. Spring

provides a transaction management package that not only replaces JDBC transaction management, but also enables declarative transaction management (configuration instead of code).

To use transactional database access, we will need to change the storage engine of the tables in the world database. The downloaded script explicitly creates MyISAM tables which do not support transactional semantics. The InnoDB storage engine does support transactions and this is what we will be using. We can change the storage engine with the following statements.

```
ALTER TABLE City ENGINE=InnoDB;
ALTER TABLE Country ENGINE=InnoDB;
ALTER TABLE CountryLanguage ENGINE=InnoDB;
```

A good programming practice emphasized by Spring is separating interfaces and implementations. What this means is that we can create a Java interface and only use the operations on this interface without any internal knowledge of what the actual implementation is. We will let Spring manage the implementation and with this it will manage the transactions for our implementation.

First you create a simple interface:

```
public interface Ex3Dao {
    Integer createCity(String name, String countryCode,
                      String district, Integer population);
}
```

This interface contains one method that will create a new city record in the database and return the id of the new record. Next you need to create an implementation of this interface.

```
public class Ex3DaoImpl implements Ex3Dao {
    protected DataSource dataSource;
    protected SqlUpdate updateQuery;
    protected SqlFunction idQuery;

    public Integer createCity(String name, String countryCode,
                             String district, Integer population) {
        updateQuery.update(new Object[] { name, countryCode,
                                         district, population });
        return getLastId();
    }

    protected Integer getLastId() {
        return idQuery.run();
    }
}
```

You can see that we only operate on abstract query objects here and do not deal directly with the JDBC API. Also, this is the complete implementation. All of our transaction management will be dealt with in the configuration. To get the configuration started, we need to create the DAO.

```
<bean id="dao" class="code.Ex3DaoImpl">
    <property name="dataSource" ref="dataSource"/>
    <property name="updateQuery">...</property>
    <property name="idQuery">...</property>
</bean>
```

Now you need to set up the transaction configuration. The first thing you must do is create transaction manager to manage the data source and a specification of what transaction properties are required for the `dao` methods.

```
<bean id="transactionManager"
      class="org.springframework.jdbc.datasource.DataSourceTransactionManager">
    <property name="dataSource" ref="dataSource"/>
</bean>

<tx:advice id="txAdvice" transaction-manager="transactionManager">
    <tx:attributes>
        <tx:method name="*"/>
    </tx:attributes>
</tx:advice>
```

The preceding code creates a transaction manager that handles transactions for the data source provided to it. The `txAdvice` uses this transaction manager and the attributes specify to create a transaction for all methods. Finally you need to apply this advice with an AOP pointcut.

```
<aop:config>
    <aop:pointcut id="daoMethods"
                  expression="execution(* code.Ex3Dao.*(..))"/>
    <aop:advisor advice-ref="txAdvice" pointcut-ref="daoMethods"/>
</aop:config>
```

This basically says that all methods called on the `Ex3Dao` interface will be wrapped in a transaction. To make use of this, you only have to retrieve the `dao` from the application context and call a method on the `dao` instance.

```
Ex3Dao dao = (Ex3Dao) ctx.getBean("dao");
Integer id = dao.createCity(name, countryCode, district, pop);
```

We can verify from this that there is no transaction management happening in our Java code and it is all configured with Spring. This is a very powerful notion and regarded as one of the most beneficial features of Spring.

22.3.5.2.4.3. Connection Pooling

In many situations, such as web applications, there will be a large number of small database transactions. When this is the case, it usually makes sense to create a pool of database connections available for web requests as needed. Although MySQL does not spawn an extra process when a connection is made, there is still a small amount of overhead to create and set up the connection. Pooling of connections also alleviates problems such as collecting large amounts of sockets in the `TIME_WAIT` state.

Setting up pooling of MySQL connections with Spring is as simple as changing the data source configuration in the application context. There are a number of configurations that we can use. The first example is based on the [Jakarta Commons DBCP library](#). The example below replaces the source configuration that was based on `DriverManagerDataSource` with DBCP's `BasicDataSource`.

```
<bean id="dataSource" destroy-method="close"
  class="org.apache.commons.dbcp.BasicDataSource">
  <property name="driverClassName" value="${db.driver}" />
  <property name="url" value="${db.jdbcurl}" />
  <property name="username" value="${db.username}" />
  <property name="password" value="${db.password}" />
  <property name="initialSize" value="3" />
</bean>
```

The configuration of the two solutions is very similar. The difference is that DBCP will pool connections to the database instead of creating a new connection every time one is requested. We have also set a parameter here called `initialSize`. This tells DBCP that we want three connections in the pool when it is created.

Another way to configure connection pooling is to configure a data source in our J2EE application server. Using JBoss as an example, you can set up the MySQL connection pool by creating a file called `mysql-local-ds.xml` and placing it in the server/default/deploy directory in JBoss. Once we have this setup, we can use JNDI to look it up. With Spring, this lookup is very simple. The data source configuration looks like this.

```
<jee:jndi-lookup id="dataSource" jndi-name="java:MySQL_DS" />
```

22.3.5.2.5. Using Connector/J with GlassFish

This section explains how to use MySQL Connector/J with Glassfish™ Server Open Source Edition 3.0.1. Glassfish can be downloaded from the [Glassfish website](#).

Once Glassfish is installed you will need to make sure it can access MySQL Connector/J. To do this copy the MySQL Connector/J JAR file to the directory `GLASSFISH_INSTALL/glassfish/lib`. For example, copy `mysql-connect-or-java-5.1.12-bin.jar` to `C:\glassfishv3\glassfish\lib`. Restart the Glassfish Application Server.

You are now ready to create JDBC Connection Pools and JDBC Resources.

Creating a Connection Pool

1. In the Glassfish Administration Console, using the navigation tree navigate to **RESOURCES, JDBC, CONNECTION POOLS**.
2. In the **JDBC CONNECTION POOLS** frame click **NEW**. You will enter a two step wizard.
3. In the **NAME** field under **GENERAL SETTINGS** enter the name for the connection pool, for example enter `MySQLConnPool`.
4. In the **RESOURCE TYPE** field, select `javax.sql.DataSource` from the drop-down listbox.
5. In the **DATABASE VENDOR** field, select `MySQL` from the drop-down listbox. Click **NEXT** to go to the next page of the wizard.
6. You can accept the default settings for General Settings, Pool Settings and Transactions for this example. Scroll down to Additional Properties.
7. In Additional Properties you will need to ensure the following properties are set:
 - **ServerName** - The server you wish to connect to. For local testing this will be `localhost`.
 - **User** - The user name with which to connect to MySQL.
 - **Password** - The corresponding password for the user.

- **DatabaseName** - The database you wish to connect to, for example the sample MySQL database [World](#).
8. Click FINISH to exit the wizard. You will be taken to the **JDBC CONNECTION POOLS** page where all current connection pools, including the one you just created, will be displayed.
 9. In the **JDBC CONNECTION POOLS** frame click on the connection pool you just created. Here you can review and edit information about the connection pool.
 10. To test your connection pool click the PING button at the top of the frame. A message will be displayed confirming correct operation or otherwise. If an error message is received recheck the previous steps, and ensure that MySQL Connector/J has been correctly copied into the previously specified location.

Now that you have created a connection pool you will also need to create a JDBC Resource (data source) for use by your application.

Creating a JDBC Resource

Your Java application will usually reference a data source object to establish a connection with the database. This needs to be created first using the following procedure.

- Using the navigation tree in the Glassfish Administration Console, navigate to **RESOURCES**, **JDBC**, **JDBC RESOURCES**. A list of resources will be displayed in the **JDBC RESOURCES** frame.
- Click NEW. The **NEW JDBC RESOURCE** frame will be displayed.
- In the **JNDI NAME** field, enter the JNDI name that will be used to access this resource, for example enter [jdbc/MySQLDataSource](#).
- In the **POOL NAME** field, select a connection pool you want this resource to use from the drop-down listbox.
- Optionally, you can enter a description into the **DESCRIPTION** field.
- Additional properties can be added if required.
- Click OK to create the new JDBC resource. The **JDBC RESOURCES** frame will list all available JDBC Resources.

22.3.5.2.5.1. A Simple JSP Application with Glassfish, Connector/J and MySQL

This section shows how to deploy a simple JSP application on Glassfish, that connects to a MySQL database.

This example assumes you have already set up a suitable Connection Pool and JDBC Resource, as explained in the preceding sections. It is also assumed you have a sample database installed, such as [world](#).

The main application code, [index.jsp](#) is presented here:

```
<%@ page import="java.sql.* , javax.sql.* , java.io.* , javax.naming.*" %>
<html>
<head><title>Hello world from JSP</title></head>
<body>
<%
    InitialContext ctx;
    DataSource ds;
    Connection conn;
    Statement stmt;
    ResultSet rs;

    try {
        ctx = new InitialContext();
        ds = (DataSource) ctx.lookup("java:comp/env/jdbc/MySQLDataSource");
        //ds = (DataSource) ctx.lookup("jdbc/MySQLDataSource");
        conn = ds.getConnection();
        stmt = conn.createStatement();
        rs = stmt.executeQuery("SELECT * FROM Country");

        while(rs.next()) {
    %>
            <h3>Name: <%= rs.getString("Name") %></h3>
            <h3>Population: <%= rs.getString("Population") %></h3>
    <%
        }
    }
    catch (SQLException se) {
    %>
        <%= se.getMessage() %>
    <%
}
```

```

        }
    catch (NamingException ne) {
%>      <%= ne.getMessage() %>
<% }
%>
</body>
</html>

```

In addition two XML files are required: `web.xml`, and `sun-web.xml`. There may be other files present, such as classes and images. These files are organized into the directory structure as follows:

```

index.jsp
WEB-INF
|
- web.xml
- sun-web.xml

```

The code for `web.xml` is:

```

<?xml version="1.0" encoding="UTF-8"?>
<web-app version="2.4" xmlns="http://java.sun.com/xml/ns/j2ee" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi
<display-name>HelloWebApp</display-name>
<distributable/>
<resource-ref>
  <res-ref-name>jdbc/MySQLDataSource</res-ref-name>
  <res-type>javax.sql.DataSource</res-type>
  <res-auth>Container</res-auth>
  <res-sharing-scope>Shareable</res-sharing-scope>
</resource-ref>
</web-app>

```

The code for `sun-web.xml` is:

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE sun-web-app PUBLIC "-//Sun Microsystems, Inc.//DTD Application Server 8.1 Servlet 2.4//EN" "http://www.sun.co
<sun-web-app>
  <context-root>HelloWebApp</context-root>
  <resource-ref>
    <res-ref-name>jdbc/MySQLDataSource</res-ref-name>
    <jndi-name>jdbc/MySQLDataSource</jndi-name>
  </resource-ref>
</sun-web-app>

```

These XML files illustrate a very important aspect of running JDBC applications on Glassfish. On Glassfish it is important to map the string specified for a JDBC resource to its JNDI name, as set up in the Glassfish administration console. In this example, the JNDI name for the JDBC resource, as specified in the Glassfish Administration console when creating the JDBC Resource, was `jdbc/MySQLDataSource`. This must be mapped to the name given in the application. In this example the name specified in the application, `jdbc/MySQLDataSource`, and the JNDI name, happen to be the same, but this does not necessarily have to be the case. Note that the XML element `<res-ref-name>` is used to specify the name as used in the application source code, and this is mapped to the JNDI name specified using the `<jndi-name>` element, in the file `sun-web.xml`. The resource also has to be created in the `web.xml` file, although the mapping of the resource to a JNDI name takes place in the `sun-web.xml` file.

If you do not have this mapping set up correctly in the XML files you will not be able to lookup the data source using a JNDI lookup string such as:

```
ds = (DataSource) ctx.lookup("java:comp/env/jdbc/MySQLDataSource");
```

You will still be able to access the data source directly using:

```
ds = (DataSource) ctx.lookup("jdbc/MySQLDataSource");
```

With the source files in place, in the correct directory structure, you are ready to deploy the application:

1. In the navigation tree, navigate to **APPLICATIONS** - the **APPLICATIONS** frame will be displayed. Click **DEPLOY**.
2. You can now deploy an application packaged into a single WAR file from a remote client, or you can choose a packaged file or directory that is locally accessible to the server. If you are simply testing an application locally you can simply point Glassfish at the directory that contains your application, without needing to package the application into a WAR file.
3. Now select the application type from the **TYPE** drop-down listbox, which in this example is **Web application**.

4. Click OK.

Now, when you navigate to the **APPLICATIONS** frame, you will have the option to **LAUNCH**, **REDEPLOY**, or **RESTART** your application. You can test your application by clicking **LAUNCH**. The application will connect to the MySQL database and display the Name and Population of countries in the [Country](#) table.

22.3.5.2.5.2. A Simple Servlet with Glassfish, Connector/J and MySQL

This section describes a simple servlet that can be used in the Glassfish environment to access a MySQL database. As with the previous section, this example assumes the sample database [world](#) is installed.

The project is set up with the following directory structure:

```
index.html
WEB-INF
|
+-- web.xml
+-- sun-web.xml
+-- classes
    |
    +-- HelloWebServlet.java
    +-- HelloWebServlet.class
```

The code for the servlet, located in [HelloWebServlet.java](#), is as follows:

```
import javax.servlet.http.*;
import javax.servlet.*;
import java.io.*;
import java.sql.*;
import javax.sql.*;
import javax.naming.*;

public class HelloWebServlet extends HttpServlet {

    InitialContext ctx = null;
    DataSource ds = null;
    Connection conn = null;
    PreparedStatement ps = null;
    ResultSet rs = null;

    String sql = "SELECT Name, Population FROM Country WHERE Name=?";

    public void init () throws ServletException {
        try {
            ctx = new InitialContext();
            ds = (DataSource) ctx.lookup("java:comp/env/jdbc/MySQLDataSource");
            conn = ds.getConnection();
            ps = conn.prepareStatement(sql);
        } catch (SQLException se) {
            System.out.println("SQLException: "+se.getMessage());
        } catch (NamingException ne) {
            System.out.println("NamingException: "+ne.getMessage());
        }
    }

    public void destroy () {
        try {
            if (rs != null)
                rs.close();
            if (ps != null)
                ps.close();
            if (conn != null)
                conn.close();
            if (ctx != null)
                ctx.close();
        } catch (SQLException se) {
            System.out.println("SQLException: "+se.getMessage());
        } catch (NamingException ne) {
            System.out.println("NamingException: "+ne.getMessage());
        }
    }

    public void doPost(HttpServletRequest req, HttpServletResponse resp){
        try {
            String country_name = req.getParameter("country_name");
            resp.setContentType("text/html");
            PrintWriter writer = resp.getWriter();
            writer.println("<html><body>");
            writer.println("<p>Country: "+country_name+"</p>");
            ps.setString(1, country_name);
            rs = ps.executeQuery();
            if (!rs.next()){
                writer.println("<p>Country does not exist!</p>");
            }
        }
```

```

        else {
            rs.beforeFirst();
            while(rs.next()) {
                writer.println("<p>Name: "+rs.getString("Name")+"</p>");
                writer.println("<p>Population: "+rs.getString("Population")+"</p>");
            }
            writer.println("</body></html>");
            writer.close();
        }
    } catch (Exception e) {
        e.printStackTrace();
    }
}

public void doGet(HttpServletRequest req, HttpServletResponse resp){
    try {
        resp.setContentType("text/html");
        PrintWriter writer = resp.getWriter();
        writer.println("<html><body>");
        writer.println("<p>Hello from servlet doGet()</p>");
        writer.println("</body></html>");
        writer.close();
    } catch (Exception e) {
        e.printStackTrace();
    }
}
}

```

In the preceding code a basic `doGet()` method is implemented, but is not used in the example. The code to establish the connection with the database is as shown in the previous example, [Section 22.3.5.2.5.1, “A Simple JSP Application with Glassfish, Connector/J and MySQL”](#), and is most conveniently located in the servlet `init()` method. The corresponding freeing of resources is located in the destroy method. The main functionality of the servlet is located in the `doPost()` method. If the user enters into the input form a country name that can be located in the database, the population of the country is returned. The code is invoked using a POST action associated with the input form. The form is defined in the file `index.html`:

```

<html>
  <head><title>HelloWebServlet</title></head>

  <body>
    <h1>HelloWebServlet</h1>

    <p>Please enter country name:</p>

    <form action="HelloWebServlet" method="POST">
      <input type="text" name="country_name" length="50" />
      <input type="submit" value="Submit" />
    </form>

  </body>
</html>

```

The XML files `web.xml` and `sun-web.xml` are as for the example in the preceding section, [Section 22.3.5.2.5.1, “A Simple JSP Application with Glassfish, Connector/J and MySQL”](#), no additional changes are required.

When compiling the Java source code, you will need to specify the path to the file `javaee.jar`. On Windows, this can be done as follows:

```
shell> javac -classpath c:\glassfishv3\glassfish\lib\javaee.jar HelloWebServlet.java
```

Once the code is correctly located within its directory structure, and compiled, the application can be deployed in Glassfish. This is done in exactly the same way as described in the preceding section, [Section 22.3.5.2.5.1, “A Simple JSP Application with Glassfish, Connector/J and MySQL”](#).

Once deployed the application can be launched from within the Glassfish Administration Console. Enter a country name such as “England”, and the application will return “Country does not exist!”. Enter “France”, and the application will return a population of 59225700.

22.3.5.3. Connector/J: Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

Questions

- [23.3.5.3.1:](#) When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What is going on? I can connect just fine with the MySQL command-line client.

- [23.3.5.3.2:](#) My application throws an SQLException 'No Suitable Driver'. Why is this happening?
- [23.3.5.3.3:](#) I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

- [23.3.5.3.4:](#) I have a servlet/application that works fine for a day, and then stops working overnight
- [23.3.5.3.5:](#) I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.
- [23.3.5.3.6:](#) I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.
- [23.3.5.3.7:](#) I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MysqlIO.readFully(MysqlIO.java:1392)
at com.mysql.jdbc.MysqlIO.readPacket(MysqlIO.java:1414)
at com.mysql.jdbc.MysqlIO.doHandshake(MysqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)
```

- [23.3.5.3.8:](#) My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.
- [23.3.5.3.9:](#) When using `gcj` an `java.io.CharConversionException` is raised when working with certain character sequences.
- [23.3.5.3.10:](#) Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.
- [23.3.5.3.11:](#) You get an `ER_NET_PACKET_TOO_LARGE` exception, even though the binary blob size you want to insert using JDBC is safely below the `max_allowed_packet` size.
- [23.3.5.3.12:](#) What should you do if you receive error messages similar to the following: "Communications link failure – Last packet sent to the server was X ms ago"?
- [23.3.5.3.13:](#) Why does Connector/J not reconnect to MySQL and re-issue the statement after a communication failure, instead of throwing an Exception, even though I use the `autoReconnect` connection string option?
- [23.3.5.3.14:](#) How can I use 3-byte UTF8 with Connector/J?
- [23.3.5.3.15:](#) How can I use 4-byte UTF8, `utf8mb4` with Connector/J?
- [23.3.5.3.16:](#) Using `useServerPrepStmts=false` and certain character encodings can lead to corruption when inserting BLOBs. How can this be avoided?

Questions and Answers

23.3.5.3.1: When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What is going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be permitted.

You must add the necessary security credentials to the MySQL server for this to happen, using the [GRANT](#) statement to your MySQL Server. See [Section 12.4.1.3, “GRANT Syntax”](#), for more information.

Note

Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special host name `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the host name instead.

Warning

Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

23.3.5.3.2: My application throws an SQLException 'No Suitable Driver'. Why is this happening?

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 22.3.2, “Connector/J Installation”](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using DriverManager, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

23.3.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.  
Is there a MySQL server running on the machine/port you  
are trying to connect to?  
  
(java.security.AccessControlException)  
SQLState: 08S01  
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the "--skip-networking" option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the .class files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the "--skip-networking" flag, or if it is firewalled.

If MySQL has been started with the "--skip-networking" option set (the Debian Linux package of MySQL server does this for example), you need to comment it out in the file `/etc/mysql/my.cnf` or `/etc/my.cnf`. Of course your `my.cnf` file might also exist in the `data` directory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by us always look in `/etc/my.cnf` and `[datadir]/my.cnf`. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

23.3.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the "autoReconnect" parameter (see [Section 22.3.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#)).

Also, you should be catching `SQLExceptions` in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the `SQLState` (see `java.sql.SQLException.getSQLState()` in your APIDOCs) to "08S01" when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

Example 22.12. Connector/J: Example of transaction with retry logic

```

public void doBusinessOp() throws SQLException {
    Connection conn = null;
    Statement stmt = null;
    ResultSet rs = null;

    //
    // How many times do you want to retry the transaction
    // (or at least _getting_ a connection)?
    //
    int retryCount = 5;

    boolean transactionCompleted = false;

    do {
        try {
            conn = getConnection(); // assume getting this from a
                                   // javax.sql.DataSource, or the
                                   // java.sql.DriverManager

            conn.setAutoCommit(false);

            //
            // Okay, at this point, the 'retry-ability' of the
            // transaction really depends on your application logic,
            // whether or not you're using autocommit (in this case
            // not), and whether you're using transactional storage
            // engines
            //
            // For this example, we'll assume that it's _not_ safe
            // to retry the entire transaction, so we set retry
            // count to 0 at this point
            //
            // If you were using exclusively transaction-safe tables,
            // or your application could recover from a connection going
            // bad in the middle of an operation, then you would not
            // touch 'retryCount' here, and just let the loop repeat
            // until retryCount == 0.
            //
            retryCount = 0;

            stmt = conn.createStatement();

            String query = "SELECT foo FROM bar ORDER BY baz";
            rs = stmt.executeQuery(query);

            while (rs.next()) {
            }

            rs.close();
            rs = null;

            stmt.close();
            stmt = null;

            conn.commit();
            conn.close();
            conn = null;

            transactionCompleted = true;
        } catch (SQLException sqlEx) {
            //
            // The two SQL states that are 'retry-able' are 08S01
            // for a communications error, and 40001 for deadlock.
            //
            // Only retry if the error was due to a stale connection,
            // communications problem or deadlock
            //

            String sqlState = sqlEx.getSQLState();

            if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
                retryCount--;
            } else {
                retryCount = 0;
            }
        } finally {
            if (rs != null) {
                try {
                    rs.close();
                } catch (SQLException sqlEx) {
                    // You'd probably want to log this . . .
                }
            }

            if (stmt != null) {
                try {
                    stmt.close();
                } catch (SQLException sqlEx) {
                    // You'd probably want to log this as well . . .
                }
            }
        }
    }
}

```

```

        }
    }

    if (conn != null) {
        try {
            //
            // If we got here, and conn is not null, the
            // transaction should be rolled back, as not
            // all work has been done

            try {
                conn.rollback();
            } finally {
                conn.close();
            }
        } catch (SQLException sqlEx) {
            //
            // If we got an exception here, something
            // pretty serious is going on, so we better
            // pass it up the stack, rather than just
            // logging it. .
            throw sqlEx;
        }
    }
} while (!transactionCompleted && (retryCount > 0));
}

```

Note

Use of the `autoReconnect` option is not recommended because there is no safe method of reconnecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The `autoReconnect` facility is deprecated, and may be removed in a future release.

23.3.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using `UPDATE` or `DELETE` statements on a table where you can individually specify the criteria to be matched using a `WHERE` clause.

23.3.5.3.6: I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.

Make sure that the `skip-networking` option has not been enabled on your server. Connector/J must be able to communicate with your server over TCP/IP, named sockets are not supported. Also ensure that you are not filtering connections through a Firewall or other network security system. For more information, see [Section C.5.2.2, “Can't connect to \[local\] MySQL server”](#).

23.3.5.3.7: I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```

java.net.SocketException
MESSAGE: Software caused connection abort: recv failed
STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MysqlIO.readFully(MysqlIO.java:1392)
at com.mysql.jdbc.MysqlIO.readPacket(MysqlIO.java:1414)
at com.mysql.jdbc.MysqlIO.doHandshake(MysqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)

```

The error probably indicates that you are using a older version of the Connector/J JDBC driver (2.0.14 or 3.0.x) and you are trying to connect to a MySQL server with version 4.1x or newer. The older drivers are not compatible with 4.1 or newer of MySQL as they do not support the newer authentication mechanisms.

It is likely that the older version of the Connector/J driver exists within your application directory or your `CLASSPATH` includes the older Connector/J package.

23.3.5.3.8: My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL

database. Under heavy loads I am getting a error and stack trace, but these only occur after a fixed period of heavy activity.

This is a JBoss, not Connector/J, issue and is connected to the use of transactions. Under heavy loads the time taken for transactions to complete can increase, and the error is caused because you have exceeded the predefined timeout.

You can increase the timeout value by setting the `TransactionTimeout` attribute to the `TransactionManagerService` within the `/conf/jboss-service.xml` file (pre-4.0.3) or `/deploy/jta-service.xml` for JBoss 4.0.3 or later. See `TransactionTimeout` within the JBoss wiki for more information.

23.3.5.3.9: When using gcj an `java.io.CharConversionException` is raised when working with certain character sequences.

This is a known issue with `gcj` which raises an exception when it reaches an unknown character or one it cannot convert. You should add `useJvmCharsetConverters=true` to your connection string to force character conversion outside of the `gcj` libraries, or try a different JDK.

23.3.5.3.10: Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.

Connector/J adds conditions to the `WHERE` clause during an `UPDATE` to check the old values of the primary key. If there is no match then Connector/J considers this a failure condition and raises an exception.

The problem is that rounding differences between supplied values and the values stored in the database may mean that the values never match, and hence the update fails. The issue will affect all queries, not just those from Connector/J.

To prevent this issue, use a primary key that does not use `FLOAT`. If you have to use a floating point column in your primary key use `DOUBLE` or `DECIMAL` types in place of `FLOAT`.

23.3.5.3.11: You get an `ER_NET_PACKET_TOO_LARGE` exception, even though the binary blob size you want to insert using JDBC is safely below the `max_allowed_packet` size.

This is because the `hexEscapeBlock()` method in `com.mysql.jdbc.PreparedStatement.streamToBytes()` may almost double the size of your data.

23.3.5.3.12: What should you do if you receive error messages similar to the following: “Communications link failure – Last packet sent to the server was X ms ago”?

Generally speaking, this error suggests that the network connection has been closed. There can be several root causes:

- Firewalls or routers may clamp down on idle connections (the MySQL client/server protocol does not ping).
- The MySQL Server may be closing idle connections which exceed the `wait_timeout` or `interactive_timeout` threshold.

To help troubleshoot these issues, the following tips can be used. If a recent (5.1.13+) version of Connector/J is used, you will see an improved level of information compared to earlier versions. Older versions simply display the last time a packet was sent to the server, which is frequently 0 ms ago. This is of limited use, as it may be that a packet was just sent, while a packet from the server has not been received for several hours. Knowing the period of time since Connector/J last received a packet from the server is useful information, so if this is not displayed in your exception message, it is recommended that you update Connector/J.

Further, if the time a packet was last sent/received exceeds the `wait_timeout` or `interactive_timeout` threshold, this is noted in the exception message.

Although network connections can be volatile, the following can be helpful in avoiding problems:

- Ensure connections are valid when used from the connection pool. Use a query that starts with `/* ping */` to execute a lightweight ping instead of full query. Note, the syntax of the ping needs to be exactly as specified here.
- Minimize the duration a connection object is left idle while other application logic is executed.
- Explicitly validate the connection before using it if the connection has been left idle for an extended period of time.
- Ensure that `wait_timeout` and `interactive_timeout` are set sufficiently high.
- Ensure that `tcpKeepalive` is enabled.
- Ensure that any configurable firewall or router timeout settings allow for the maximum expected connection idle time.

Note

Do not expect to be able to reuse a connection without problems, if it has been lying idle for a period. If a connection is to be reused after being idle for any length of time, ensure that you explicitly test it before reusing it.

23.3.5.3.13: Why does Connector/J not reconnect to MySQL and re-issue the statement after a communication failure, instead of throwing an Exception, even though I use the `autoReconnect` connection string option?

There are several reasons for this. The first is transactional integrity. The MySQL Reference Manual states that “there is no safe method of reconnecting to the MySQL server without risking some corruption of the connection state or database state information”. Consider the following series of statements for example:

```
conn.createStatement().execute(  
    "UPDATE checking_account SET balance = balance - 1000.00 WHERE customer='Smith'");  
conn.createStatement().execute(  
    "UPDATE savings_account SET balance = balance + 1000.00 WHERE customer='Smith'");  
conn.commit();
```

Consider the case where the connection to the server fails after the `UPDATE` to `checking_account`. If no exception is thrown, and the application never learns about the problem, it will continue executing. However, the server did not commit the first transaction in this case, so that will get rolled back. But execution continues with the next transaction, and increases the `savings_account` balance by 1000. The application did not receive an exception, so it continued regardless, eventually committing the second transaction, as the commit only applies to the changes made in the new connection. Rather than a transfer taking place, a deposit was made in this example.

Note that running with `auto-commit` enabled does not solve this problem. When Connector/J encounters a communication problem, there is no means to determine whether the server processed the currently executing statement or not. The following theoretical states are equally possible:

- The server never received the statement, and therefore no related processing occurred on the server.
- The server received the statement, executed it in full, but the response was not received by the client.

If you are running with `auto-commit` enabled, it is not possible to guarantee the state of data on the server when a communication exception is encountered. The statement may have reached the server, or it may not. All you know is that communication failed at some point, before the client received confirmation (or data) from the server. This does not only affect `auto-commit` statements though. If the communication problem occurred during `Connection.commit()`, the question arises of whether the transaction was committed on the server before the communication failed, or whether the server received the commit request at all.

The second reason for the generation of exceptions is that transaction-scoped contextual data may be vulnerable, for example:

- Temporary tables
- User-defined variables
- Server-side prepared statements

These items are lost when a connection fails, and if the connection silently reconnects without generating an exception, this could be detrimental to the correct execution of your application.

In summary, communication errors generate conditions that may well be unsafe for Connector/J to simply ignore by silently reconnecting. It is necessary for the application to be notified. It is then for the application developer to decide how to proceed in the event of connection errors and failures.

23.3.5.3.14: How can I use 3-byte UTF8 with Connector/J?

To use 3-byte UTF8 with Connector/J set `characterEncoding=utf8` and set `useUnicode=true` in the connection string.

23.3.5.3.15: How can I use 4-byte UTF8, `utf8mb4` with Connector/J?

To use 4-byte UTF8 with Connector/J configure the MySQL server with `character_set_server=utf8mb4`. Connector/J will then use that setting as long as `characterEncoding` has not been set in the connection string. This is equivalent to auto-detection of the character set.

23.3.5.3.16: Using `useServerPrepStmts=false` and certain character encodings can lead to corruption when inserting BLOBs. How can this be avoided?

When using certain character encodings, such as SJIS, CP932, and BIG5, it is possible that BLOB data contains characters that can be interpreted as control characters, for example, backslash, '\'. This can lead to corrupted data when inserting BLOBS into the database. There are two things that need to be done to avoid this:

1. Set the connection string option `useServerPrepStmts` to `true`.
2. Set `SQL_MODE` to `NO_BACKSLASH_ESCAPES`.

22.3.6. Connector/J Support

22.3.6.1. Connector/J Community Support

Oracle provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.6.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [JDBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.6.2, “MySQL Community Support at the MySQL Forums”](#).

22.3.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to <security@mysql.com>.

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you do not waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details do not matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions like, “Why doesn’t this work for me?” Then we find that the feature requested wasn’t implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, stanalone testcase that doesn’t involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `'com.mysql.jdbc.util.BaseBugReport'`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (that is, there is more than one connection involved).
- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from 'jdbc:mysql://test', override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
    new MyBugReport().run();
}
```

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

22.3.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.6, “MySQL Connector/J Change History”](#).

22.4. MySQL Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding another parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](#).

22.4.1. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-configured data directory. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

22.4.2. Connector/MXJ Versions

Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.x and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.

A summary of the different MySQL versions supplied with each Connector/MXJ release are shown in the table.

Connector/MXJ Version	MySQL Version(s)
5.0.11	5.1.40
5.0.9	5.0.51a (CS), 5.0.54 (ES)
5.0.8	5.0.45 (CS), 5.0.46 (ES)
5.0.7	5.0.41 (CS), 5.0.42 (ES)
5.0.6	5.0.37 (CS), 5.0.40 (ES)
5.0.5	5.0.37 (CS), 5.0.36 (ES)
5.0.4	5.0.27 (CS), 5.0.32 (ES)
5.0.3	5.0.22
5.0.2	5.0.19

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

22.4.3. Connector/MXJ Installation

Connector/MXJ does not have a installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer
- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

22.4.3.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqld` binary for a select number of platforms which differs by version. The following platforms have been tested and working as deployment platforms. Support for all the platforms listed below is not included by default.

- Linux (i386)
- FreeBSD (i386)
- Windows NT (x86), Windows 2000 (x86), Windows XP (x86), Windows Vista (x86)
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

The Connector/MXJ 5.0.8 release includes `mysqld` binaries for the following platforms:

- Linux (i386)
- Windows (x86), compatible with Windows NT, Windows 2000, Windows XP , Windows Vista
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 22.4.6.1, “Creating your own Connector/MXJ Package”](#)

22.4.3.2. Connector/MXJ Base Installation

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the `Program Files` directory.

To install the files, for a Connector/MXJ 5.0.4 installation:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems) or Zip format (Windows).

2. Extract the files from the package. This will create a directory `mysql-connector-mxj-gpl-[ver]`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the required `jar` files.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the [Environment Variables](#) configured through the [System](#) control panel.

For Connector/MXJ 5.0.6 and later you need the following JAR files in your `CLASSPATH`:

- `mysql-connector-mxj-gpl-[ver].jar`: contains the main Connector/MXJ classes.
- `mysql-connector-mxj-gpl-[ver]-db-files.jar`: contains the embedded `mysqld` and database files.
- `aspectjrt.jar`: the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
- `mysql-connector-java-[ver]-bin.jar`: Connector/J, see [Section 22.3, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.4 and later you need the following JAR files in your `CLASSPATH`:

- `connector-mxj.jar`: contains the main Connector/MXJ classes.
- `connector-mxj-db-files.jar`: contains the embedded `mysqld` and database files.
- `aspectjrt.jar`: the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
- `mysql-connector-mxj-gpl-[ver].jar`: Connector/J, see [Section 22.3, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.3 and earlier, you need the following JAR files:

- `connector-mxj.jar`
- `aspectjrt.jar`: the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
- `mysql-connector-mxj-gpl-[ver].jar`: Connector/J, see [Section 22.3, “MySQL Connector/J”](#).

22.4.3.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the `ConnectorMXJUrlTestExample`:

```
shell> java ConnectorMXJUrlTestExample
jdbc:mysql://localhost:3336/our_test_app?server_basedir=
    =/var/tmp/test-mxj&createDatabaseIfNotExist=true&server.initialize-user=true
[/var/tmp/test-mxj/bin/mysqld][--no-defaults][--port=3336][--socket=mysql.sock]>
    [--basedir=/var/tmp/test-mxj][--datadir=/var/tmp/test-mxj/data]>
    [--pid-file=/var/tmp/test-mxj/data/MysqldResource.pid]
[MysqldResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
InnoDB: a new database to be created!
080220  9:40:20  InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
080220  9:40:20  InnoDB: Log file ./ib_logfile0 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
080220  9:40:20  InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
080220  9:40:21  InnoDB: Started; log sequence number 0 0
080220  9:40:21 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.51a' socket: 'mysql.sock' port: 3336 MySQL Community Server (GPL)
[MysqldResource] mysqld running as process: 2238
-----
SELECT VERSION()
-----
```

```

5.0.51a
-----
[MysqldResource] stopping mysqld (process: 2238)
080220  9:40:27 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown

080220  9:40:27  InnoDB: Starting shutdown...
080220  9:40:29  InnoDB: Shutdown completed; log sequence number 0 43655
080220  9:40:29 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete

[MysqldResource] shutdown complete

```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

Warning

You should avoid running your Connector/MXJ application as the `root` user, because this will cause the `mysqld` to also be executed with root privileges. For more information, see [Section 5.3.6, “How to Run MySQL as a Normal User”](#).

22.4.3.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld` server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `mysql-connector-mxj-gpl-[ver].jar` to the `CLASSPATH`.
If you are using Connector/MXJ v5.0.4 or later you will also need to add the `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` file to your `CLASSPATH`.
2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc:mysql:mxj://localhost:PORT/DB-NAME`.

For more details, see [Section 22.4.4, “Connector/MXJ Configuration”](#).

22.4.3.5. Deploying Connector/MXJ within JBoss

For deployment of Connector/MXJ within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ and copy the `mysql-connector-mxj-gpl-[ver].jar` file to the `$JBoss_HOME/server/default/lib` directory.
If you are using Connector/MXJ v5.0.4 or later you will also need to copy the `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` file to `$JBoss_HOME/server/default/lib`.
2. Download Connector/J and copy the `mysql-connector-java-5.1.5-bin.jar` file to the `$JBoss_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$JBoss_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```

String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql://test?propertiesTransform=" +
    "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);

```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

22.4.3.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

22.4.3.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MysqldResource` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).
2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available using your CLASSPATH.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:
 - JBoss - 4.0rc1 or newer.
 - Apache Tomcat - 5.0 or newer.
 - Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

22.4.3.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj_test_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj_test_silent" Java property to "false".

2. To run the JUnit test suite, the \$CLASSPATH must include the following:
 - JUnit
 - JMX
 - Connector/J
 - MySQL Connector/MXJ
3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysqldjmx  
ant dist
```

Then add `$TEMP/cmij/stage/connector-mxj/connector-mxj.jar` to the CLASSPATH.

4. If you have `junit`, execute the unit tests. From the command line, type:

```
java com.mysql.management.AllTestsSuite
```

The output should look something like this:

```
.....
```

```
.....  
Time: 259.438  
OK (101 tests)
```

Note that the tests are a bit slow near the end, so please be patient.

22.4.4. Connector/MXJ Configuration

22.4.4.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the mxj keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the System.out. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJUrlTestExample.java](#).

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJUrlTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "test-mxj");
        int port = Integer.parseInt(System.getProperty("c-mxj_test_port", "3336"));
        String dbName = "our_test_app";

        String url = "jdbc:mysql:mxj://localhost:" + port + "/" + dbName //
            + "?" + "server.basedir=" + databaseDir //
            + "&" + "createDatabaseIfNotExist=true"//
            + "&" + "server.initialize-user=true" //
            ;

        System.out.println(url);

        String userName = "alice";
        String password = "q93uti0opwhkd";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            conn = DriverManager.getConnection(url, userName, password);
            String sql = "SELECT VERSION()";
            String queryForString = new QueryUtil(conn).queryForString(sql);

            System.out.println("-----");
            System.out.println(sql);
            System.out.println("-----");
            System.out.println(queryForString);
            System.out.println("-----");
            System.out.flush();
            Thread.sleep(100); // wait for System.out to finish flush
        } finally {
            try {
                if (conn != null)
                    conn.close();
            } catch (Exception e) {
                e.printStackTrace();
            }
            ServerLauncherSocketFactory.shutdown(databaseDir, null);
        }
    }
}
```

To run the above program, be sure to have connector-mxj.jar and Connector/J in the CLASSPATH. Then type:

```
java ConnectorMXJUrlTestExample
```

22.4.4.2. Running within a Java Object

If you have a java application and wish to "embed" a MySQL database, make use of the `com.mysql.management.MysqldResource` class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a `java.io.File` object representing the directory you wish the server to be "unzipped" into. It may also be instantiated with printstreams for "stdout" and "stderr" for logging.

Once instantiated, a `java.util.Map`, the object will be able to provide a `java.util.Map` of server options appropriate for the platform and version of MySQL which you will be using.

The `MysqldResource` enables you to "start" MySQL with a `java.util.Map` of server options which you provide, as well as "shutdown" the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as `src/ConnectorMXJObjectTestExample.java`.

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;
import com.mysql.management.MysqldResourceI;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJObjectTestExample {
    public static final String DRIVER = "com.mysql.jdbc.Driver";

    public static final String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "mysql-mxj");
        int port = Integer.parseInt(System.getProperty("c-mxj_test_port",
            "3336"));
        String userName = "alice";
        String password = "q93uti0opwhkd";

        MysqldResource mysqldResource = startDatabase(databaseDir, port,
            userName, password);

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            String dbName = "our_test_app";
            String url = "jdbc:mysql://localhost:" + port + "/" + dbName //
                + "?" + "createDatabaseIfNotExist=true"//
            ;
            conn = DriverManager.getConnection(url, userName, password);
            String sql = "SELECT VERSION()";
            String queryForString = new QueryUtil(conn).queryForString(sql);

            System.out.println("-----");
            System.out.println(sql);
            System.out.println("-----");
            System.out.println(queryForString);
            System.out.println("-----");
            System.out.flush();
            Thread.sleep(100); // wait for System.out to finish flush
        } finally {
            try {
                if (conn != null) {
                    conn.close();
                }
            } catch (Exception e) {
                e.printStackTrace();
            }
            try {
                mysqldResource.shutdown();
            } catch (Exception e) {
                e.printStackTrace();
            }
        }
    }

    public static MysqldResource startDatabase(File databaseDir, int port,
        String userName, String password) {
        MysqldResource mysqldResource = new MysqldResource(databaseDir);

        Map database_options = new HashMap();
        database_options.put(MysqldResourceI.PORT, Integer.toString(port));
        database_options.put(MysqldResourceI.INITIALIZE_USER, "true");
        database_options.put(MysqldResourceI.INITIALIZE_USER_NAME, userName);
        database_options.put(MysqldResourceI.INITIALIZE_PASSWORD, password);

        mysqldResource.start("test-mysqld-thread", database_options);

        if (!mysqldResource.isRunning()) {
            throw new RuntimeException("MySQL did not start.");
        }
        System.out.println("MySQL is running.");
    }
}
```

```
        return mysqldResource;
    }
}
```

22.4.4.3. Setting server options

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with `server..`. In the following example we set two driver parameters and two server parameters:

```
String url = "jdbc:mysql://" + hostColonPort + "/"  
        + "?"  
        + "cacheServerConfiguration=true"  
        + "&"  
        + "useLocalSessionState=true"  
        + "&"  
        + "server.basedir=/opt/myapp/db"  
        + "&"  
        + "server.datadir=/mnt/bigdisk/myapp/data";
```

Starting with Connector/MXJ 5.0.6 you can use the `initialize-user` property to a connection string. If set to true, the default anonymous and root users will be removed and the user/password combination from the connection URL will be used to create a new user. For example:

```
String url = "jdbc:mysql:mxj://localhost:" + port  
+ "/alice_db"  
+ "?server.datadir=" + dataDir.getPath()  
+ "&server.initialize-user=true"  
+ "&createDatabaseIfNotExist=true"  
;
```

22.4.5. Connector/MXJ Reference

The following sections include detailed information on the different API interfaces to Connector/MXJ.

22.4.5.1. MysqldResource Constructors

The `MysqldResource` class supports three different constructor forms:

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err)`

Enables you to set the base directory, data directory, select a server by its version string, standard out and standard error.

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource(File baseDir);`

Enables the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqldResource();`

The basedir is defaulted to a subdirectory of the java.io.tempdir. Output for standard out and standard err are directed to System.out and System.err;

22.4.5.2. MysqldResource Methods

MysqldResource API includes the following methods:

- `void start(String threadName, Map mysqldArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the MySQL command line. The map is the set of arguments and their values to be passed to the command line.

- `void shutdown();`

Shuts down the MySQL instance managed by the MysqldResource object.

- `Map getServerOptions();`

Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.

- `boolean isRunning();`

Returns true if the MySQL database is running.

- `boolean isReadyForConnections();`

Returns true once the database reports that is ready for connections.

- `void setKillDelay(int millis);`

The default "Kill Delay" is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a "force kill" if the database has not shutdown by itself.

- `void addCompletionListenser(Runnable listener);`

Enables applications to be notified when the server process completes. Each "listener" will be fired off in its own thread.

- `String getVersion();`

Returns the version of MySQL.

- `void setVersion(int MajorVersion, int minorVersion, int patchLevel);`

The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

22.4.6. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

22.4.6.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysqld` version or platform then you must extract and rebuild the `mysql-connector-mxj.jar` (Connector/MXJ v5.0.3 or earlier) or `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ v5.0.4 or later) file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

If you are using Connector/MXJ v5.0.4 or later, you should unpack the `connector-mxj-db-files.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj-db-files.jar
shell> ls
5-0-51a/
META-INF/
connector-mxj.properties
```

The MySQL version directory, [5-0-22](#) or [5-0-51a](#) in the preceding examples, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the `data` and `share` directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
Win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the `mysqld` for Mac OS X PowerPC is located within the `Mac_OS_X-ppc` directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific `mysqld`, create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory `Mac_OS_X-i386`.

On Unix systems, you can determine the platform using `uname`:

```
shell> uname -p
i386
```

In Connector/MXJ v5.0.9 and later, an additional `platform-map.properties` file is used to associate a specific platform and operating system combination with the directory in which the `mysqld` for that combination is located. The determined operating system and platform are on the left, and the directory name where the appropriate `mysqld` is located is on the right. You can see a sample of the file below:

```
Linux-i386=Linux-i386
Linux-x86=Linux-i386
Linux-i686=Linux-i386
Linux-x86_64=Linux-i386
Linux-ia64=Linux-i386

#Linux-ppc=Linux-ppc
#Linux-ppc64=Linux-ppc

Mac_OS_X-i386=Mac_OS_X-i386
Mac_OS_X-ppc=Mac_OS_X-ppc
Rhapsody-PowerPC=Mac_OS_X-ppc
#Mac_OS-PowerPC=
#macos-PowerPC=
#MacOS-PowerPC=

SunOS-sparc=SunOS-sparc
Solaris-sparc=SunOS-sparc
SunOS-x86=SunOS-x86
Solaris-x86=SunOS-x86

FreeBSD-x86=FreeBSD-x86

Windows_Vista-x86=Win-x86
Windows_2003-x86=Win-x86
Windows_XP-x86=Win-x86
Windows_2000-x86=Win-x86
Windows_NT-x86=Win-x86
Windows_NT_(unknown)-x86=Win-x86
```

Now you need to download or compile `mysqld` for the MySQL version and platform you want to include in your custom `connector-mxj.jar` package into the new directory.

Create a file called `version.txt` in the OS/platform directory you have just created that contains the version string/path of the `mysqld` binary. For example:

```
mysql-5.0.22-osx10.3-i386/bin/mysqld
```

You can now recreate the `connector-mxj.jar` file with the added `mysqld`:

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj.jar *
```

For Connector/MXJ v5.0.4 and later, you should repackage to the `connector-mxj-db-files.jar`:

```
shell> cd custom-mxj
shell> jar -cf ..mysql-connector-mxj-gpl-[ver]-db-files.jar *
```

You should test this package using the steps outlined in [Section 22.4.3.3, “Connector/MXJ Quick Start Guide”](#).

Note

Because the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file is separate from the main Connector/MXJ classes you can distribute different `mysql-connector-mxj-gpl-[ver]-db-files.jar` files to different hosts or for different projects without having to create a completely new main `mysql-connect-or-mxj-gpl-[ver].jar` file for each one.

22.4.6.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom `data_dir.jar` file, as included within the main `connector-mxj.jar` (Connector/MXJ 5.0.3 or earlier) or `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ 5.0.4 or later) file:

1. First extract the `connector-mxj.jar` or `mysql-connector-gpl-[ver]-db-files.jar` file, as outlined in the previous section (see [Section 22.4.6.1, “Creating your own Connector/MXJ Package”](#)).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf ..data_dir.jar mysql mxjtest
```

5. For Connector/MXJ 5.0.3 or earlier, copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

For Connector/MXJ 5.0.4 or later, copy the `data_dir.jar` file into the extracted `mysql-connect-or-mxj-gpl-[ver]-db-files.jar` directory, and then create an archive for `mysql-connect-or-mxj-db-gpl-[ver]-files.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

22.4.6.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as JBoss version 4. The MBean will uses the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. The `MysqldDynamicMBean`, and
2. A `com.sun.jdmk.comm.HtmlAdaptorServer`, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.

- Current JDK, JUnit, Connector/J, MySQL Connector/MXJ
 - This section *requires* the SUN reference implementation of JMX
 - [PATH, JAVA_HOME, ANT_HOME, CLASSPATH](#)
2. If not building from source, skip to next step
- Rebuild with the "sunri.present"
- ```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```
3. Launch the test agent from the command line:
- ```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```
4. From a browser:
- ```
http://localhost:9092/
```
5. Under MysqldAgent,
- ```
select "name=mysqld"
```
6. Observe the MBean View
7. Scroll to the bottom of the screen press the STARTMYSQLD button
8. Click [Back to MBean View](#)
9. Scroll to the bottom of the screen press STOPMYSQLD button
10. Kill the java process running the Test Agent (jmx server)

22.4.6.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

1. Ensure a current version of java development kit (v1.4.x), see above.
 - Ensure [JAVA_HOME](#) is set (JBoss requires [JAVA_HOME](#))
 - Ensure [JAVA_HOME/bin](#) is in the [PATH](#) (You will NOT need to set your CLASSPATH, nor will you need any of the jars used in the previous tests).
2. Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html  
select "Downloads"  
select "jboss-4.0.zip"  
pick a mirror  
unzip ~/dload/jboss-4.0.zip  
create a JBOSS_HOME environment variable set to the unzipped directory  
unix only:  
cd $JBOSS_HOME/bin  
chmod +x *.sh
```
3. Deploy (copy) the [connector-mxj.jar](#) to [\\$JBOSS_HOME/server/default/lib](#).
4. Deploy (copy) [mysql-connector-java-3.1.4-beta-bin.jar](#) to [\\$JBOSS_HOME/server/default/lib](#).
5. Create a [mxjtest.war](#) directory in [\\$JBOSS_HOME/server/default/deploy](#).
6. Deploy (copy) [index.jsp](#) to [\\$JBOSS_HOME/server/default/deploy/mxjtest.war](#).

7. Create a `mysql-service.xml` file in `$JBOSS_HOME/server/default/deploy`.

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
  <mbean code="com.mysql.management.jmx.jboss.JBossMysqldDynamicMBean"
    name="mysql:type=service,name=mysql">
    <attribute name="datadir"/>/tmp/xxx_data_xxx</attribute>
    <attribute name="autostart">true</attribute>
  </mbean>
</server>
```

8. Start jboss:

- On unix: `$JBOSS_HOME/bin/run.sh`
- On windows: `%JBOSS_HOME%\bin\run.bat`

Be ready: JBoss sends a lot of output to the screen.

9. When JBoss seems to have stopped sending output to the screen, open a web browser to: `http://localhost:8080/jmx-console`
10. Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysqld` link.
11. Observe the JMX MBean View page. MySQL should already be running.
12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the INVOKE button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click [Back to MBean View](#)
13. To confirm MySQL is running, open a web browser to `http://localhost:8080/mxjtest/` and you should see that

```
SELECT 1
```

returned with a result of

```
1
```

14. Guided by the `$JBOSS_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service INVOKE button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

22.4.7. Connector/MXJ Samples

This section contains some sample applications using Connector/MXJ.

22.4.7.1. Using Connector/MXJ with JSP

The following web application was provided by Pavan Venkatesh as an example of a JSP based application using Connector/MXJ to provide contact data. The example consists of two components, `insertdata.jsp` and `response.jsp`. The `insertdata.jsp` provides a form into which you can enter information to be stored within the MySQL database provided by Connector/MXJ. The `response.jsp` file is called when you submit the form and then provides a table of the data.

Because the data is stored through Connector/MXJ the instantiation of the MySQL database is handled dynamically on the fly, making the script lightweight and self-contained.

Example 22.13. `insertdata.jsp`

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
  "http://www.w3.org/TR/html4/loose.dtd">
<%@ page import="java.sql.*"%>
```

```

<%@ page import="java.io.*"%>
<%@ page import="java.io.*"%>
<%@ page import="java.sql.*"%>

<HTML>
<HEAD>
<TITLE>insert data</TITLE>
<script language="Javascript">

function validFields(){

if (document.form2.ID.value == "" || document.form2.ID.value == null){
alert ( "Please enter ID / Field cannot be left blank" );
return false;
}

if (document.form2.names.value == "" || document.form2.names.value == null){
alert ( "Please enter Name / Field cannot be left blank" );
return false;
}
if (document.form2.place.value == ""|| document.form2.place.value == null){
alert ( "Please enter Place / Field cannot be left blank" );
return false;
}
if (document.form2.phone.value == ""|| document.form2.phone.value == null){
alert ( "Please enter Phone number / Field cannot be left blank" );
return false;
}
return true;
}
</script>
</HEAD>

<BODY bgcolor="#ffffcc">

22.4.8. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 22.4.8.1, “Connector/MXJ Community Support”](#).

22.4.8.1. Connector/MXJ Community Support

Oracle provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](#) mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.6.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [MyODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.6.2, “MySQL Community Support at the MySQL Forums”](#).

22.4.8.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 22.4.8.1, “Connector/MXJ Community Support”](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output

- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

22.4.8.3. Connector/MXJ Change History

The Connector/MXJ Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.7, “MySQL Connector/MXJ Change History”](#).

22.5. MySQL Connector/C++

MySQL Connector/C++ is a MySQL database connector for C++.

The MySQL Connector/C++ is licensed under the terms of the GPL, like most MySQL Connectors. There are special exceptions to the terms and conditions of the GPL as it is applied to this software, see FLOSS License Exception. If you need a non-GPL license for commercial distribution please contact us.

The MySQL Connector/C++ is compatible with the JDBC 4.0 API. However, MySQL Connector/C++ does not implement all of the JDBC 4.0 API. The MySQL Connector/C++ current version features the following classes:

- `Connection`
- `DatabaseMetaData`
- `Driver`
- `PreparedStatement`
- `ResultSet`
- `ResultSetMetaData`
- `Savepoint`
- `Statement`

The JDBC 4.0 API defines approximately 450 methods for the above mentioned classes. MySQL Connector/C++ implements around 80% of these and makes them available in the current release.

The release has been successfully compiled and tested on the following platforms:

AIX

- 5.2 (PPC32, PPC64)
- 5.3 (PPC32, PPC64)

FreeBSD

- 6.0 (x86, x86_64)

HPUX

- 11.11 (PA-RISC 32bit, PA-RISC 64bit)

Linux

- Debian 3.1 (PPC32, x86)

- FC4 (x86)
- RHEL 3 (ia64, x86, x86_64)
- RHEL 4 (ia64, x86, x86_64)
- RHEL 5 (ia64, x86, x86_64)
- SLES 9 (ia64, x86, x86_64)
- SLES 10 (ia64, x86_64)
- SuSE 10.3, (x86_64)
- Ubuntu 8.04 (x86)
- Ubuntu 8.10 (x86_64)

Mac

- MacOSX 10.3 (PPC32, PPC64)
- MacOSX 10.4 (PPC32, PPC64, x86)
- MacOSX 10.5 (PPC32, PPC64, x86, x86_64)

SunOS

- Solaris 8 (SPARC32, SPARC64, x86)
- Solaris 9 (SPARC32, SPARC64, x86)
- Solaris 10 (SPARC32, SPARC64, x86, x86_64)

Windows

- XP Professional (32bit)
- 2003 (64bit)

Future versions will run on all platforms supported by the MySQL Server.

Note

MySQL Connector/C++ supports MySQL 5.1 and later.

Note

MySQL Connector/C++ supports only Microsoft Visual Studio 2003 and above on Windows.

MySQL Connector/C++ Download

You can download the source code for the MySQL Connector/C++ current release at the [MySQL Connector/C++ downloads](#).

MySQL Connector/C++ Source repository

The latest development version is also available through [Launchpad](#).

Bazaar is used for the MySQL Connector/C++ code repository. You can check out the latest source code using the `bzr` command line tool:

```
shell> bzr branch lp:mysql/mysql-connector-cpp/trunk .
```

Binary distributions

Starting with 1.0.4 Beta, binary distributions were made available in addition to source code releases. The releases available are shown below.

Microsoft Windows platform:

- Without installer, a Zip file
- MSI installer package

Other platforms:

- Compressed GNU TAR archive (tar.gz)

Note

Note that source packages are available for all platforms in the Compressed GNU TAR archive (tar.gz) format.

Binary and source packages can be obtained from [MySQL Connector/C++ downloads](#).

MySQL Connector/C++ Advantages

Using MySQL Connector/C++ instead of the MySQL C API (MySQL Client Library) offers the following advantages for C++ users:

- Convenience of pure C++, no C function calls required
- Supports an industry standard API, JDBC 4.0
- Supports the object-oriented programming paradigm
- Reduces development time
- MySQL Connector/C++ is licensed under the GPL with the FLOSS License Exception
- MySQL Connector/C++ is available under a commercial license upon request

MySQL Connector/C++ Status

MySQL Connector/C++ is available as a GA version. We kindly ask users and developers to try it out and provide us with feedback.

Note that MySQL Workbench is successfully using MySQL Connector/C++.

If you have any queries please [contact us](#).

22.5.1. MySQL Connector/C++ Binary Installation

Caution

One problem that can occur is when the tools you use to build your application are not compatible with the tools used to build the binary versions of MySQL Connector/C++. Ideally you need to build your application with the same tools that were used to build the MySQL Connector/C++ binaries. To help with this the following resources are provided.

All distributions contain a [README](#) file, which contains platform-specific notes. At the end of the [README](#) file contained in the binary distribution you will find the settings used to build the binaries. If you experience build-related issues on a platform, it may help to check the settings used on the platform to build the binary.

Developers using Microsoft Windows need to ensure they meet the following requirements:

1. Use a supported version of Visual Studio, either Visual Studio 2005 or Visual Studio 2008.
2. Ensure that your application uses the same run time library as that used to build MySQL Connector/C++. Visual Studio 2005 builds use Microsoft.VC80.CRT (8.0.50727.762), and Visual Studio 2008 builds use Microsoft.VC90.CRT (9.0.21022.8).

3. Your application should use the same linker configuration as MySQL Connector/C++, for example use one of /MD, /MDd, /MT, /MTd.

If you wish to use a variation of the requirements previously listed, such as a different compiler version, release configuration, or run time library, you must compile MySQL Connector/C++ from source using your desired settings, and then ensure that your application is built with these same settings. The three variables of compiler version, run time library, and run time linker configuration settings should always be the same for both application and MySQL Connector/C++ itself, in order to avoid issues.

For your convenience the same information, but more frequently updated, can be found on the [MySQL Forge site](#).

A better solution is to build your MySQL Connector/C++ libraries from the source code, using the same tools that you use for building your application. This ensures compatibility.

Downloading MySQL Connector/C++

Binary and source packages can be obtained from [MySQL Connector/C++ downloads](#).

Archive Package

Unpack the archive into an appropriate directory. If you plan to use a dynamically linked version of MySQL Connector/C++, make sure that your system can reference the MySQL Client Library. Consult your operating system documentation on how to modify and expand the search path for libraries. In case you cannot modify the library search path it may help to copy your application, the MySQL Connector/C++ library and the MySQL Client Library into the same directory. Most systems search for libraries in the current directory.

Windows MSI Installer

Windows users can choose between two binary packages:

1. Without installer (unzip in C:\)
2. Windows MSI Installer (x86)

Using the MSI Installer may be the easiest solution. Running the MSI Installer does not require any administrative permissions as it simply copies files.

Figure 22.59. Windows Installer Welcome Screen

Figure 22.60. Windows Installer Overview Screen

The “Typical” installation consists of all required header files and the Release libraries. The only available “Custom” installation option enables you to install additional Debug versions of the connector libraries.

Figure 22.61. Windows Installer Custom Setup Screen

22.5.2. MySQL Connector/C++ Source Installation

The MySQL Connector/C++ is based on the MySQL Client Library (MySQL C API). MySQL Connector/C++ is linked against the MySQL Client Library. You need to have the MySQL Client Library installed to compile MySQL Connector/C++.

You also need to have the cross-platform build tool [CMake](#) 2.4, or newer, and GLib 2.2.3 or newer installed. Check the [README](#) file included with the distribution for platform specific notes on building for Windows and SunOS.

Typically the MySQL Client Library is installed when the MySQL Server is installed. However, check your operating system documentation for other installation options.

As of MySQL Connector/C++ version 1.1.0 it is necessary to have the Boost C++ libraries 1.34.0 or newer installed. Boost is only required to build the connector, it is not required to use the connector. You can obtain Boost from [the official site](#) and installation instructions can be obtained from the same site. Once Boost has been installed you will need to tell the make system where the Boost files are. This is done by setting the define `-DBOOST_ROOT:STRING=`. This can be done when initially invoking [CMake](#), for example:

```
shell> CMake . -DBOOST_ROOT:STRING=/usr/local/boost_1_40_0
```

You may need to change `/usr/local/boost_1_40_0/` to match your installation. See the [Section 22.5.2.1, “Building source on Unix, Solaris and Mac OS X”](#) and [Section 22.5.2.2, “Building source on Windows”](#) for further details.

22.5.2.1. Building source on Unix, Solaris and Mac OS X

- Run [CMake](#) to build a [Makefile](#):

```
shell> me@host:/path/to/mysql-connector-cpp> cmake .
-- Check for working C compiler: /usr/local/bin/gcc
-- Check for working C compiler: /usr/local/bin/gcc -- works
[...]
-- Generating done
```

```
-- Build files have been written to: /path/to/mysql-connector-cpp/
```

On non-Windows systems, **CMake** first checks to see if the **CMake** variable **MYSQL_CONFIG_EXECUTABLE** is set. If it is not found **CMake** tries to locate **mysql_config** in the default locations.

If you have any problems with the configure process please check the troubleshooting instructions below.

2. Use make to build the libraries. First make sure you have a clean build:

```
shell> me@host:/path/to/mysql-connector-cpp> make clean
```

Then build the connector:

```
me@host:/path/to/mysql-connector-cpp> make
[ 1%] Building CXX object »
driver/CMakeFiles/mysqlcppconn.dir/mysql_connection.o
[ 3%] Building CXX object »
driver/CMakeFiles/mysqlcppconn.dir/mysql_constructed_resultset.o
[...]
[100%] Building CXX object examples/CMakeFiles/statement.dir/statement.o
Linking CXX executable statement
```

If all goes well, you will find the MySQL Connector/C++ library in [/path/to/cppconn/libmysqlcppconn.so](#).

3. Finally make sure the header and library files are installed to their correct locations:

```
make install
```

Unless you have changed this in the configuration step, the header files will be copied to the directory [/usr/local/include](#). The header files copied are **mysql_connection.h** and **mysql_driver.h**.

Again, unless you have specified otherwise, the library files will be copied to [/usr/local/lib](#). The files copied are **libmysqlcppcon.so**, the dynamic library, and **libmysqlcppconn-static.a**, the static library.

If you encounter any errors, please first carry out the checks shown below:

1. **CMake** options: MySQL installation path, debug version and more

In case of configuration or compilation problems, check the list of **CMake** options:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake -L
[...]
CMAKE_BACKWARDS_COMPATIBILITY:STRING=2.4
CMAKE_BUILD_TYPE:STRING=
CMAKE_INSTALL_PREFIX:PATH=/usr/local
EXECUTABLE_OUTPUT_PATH:PATH=
LIBRARY_OUTPUT_PATH:PATH=
MYSQLCPPCONN_GCOV_ENABLE:BOOL=0
MYSQLCPPCONN_TRACE_ENABLE:BOOL=0
MYSQL_CONFIG_EXECUTABLE:FILEPATH=/usr/bin/mysql_config
```

For example, if your MySQL Server installation path is not [/usr/local/mysql](#) and you want to build a debug version of the MySQL Connector/C++ use:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake »
-D CMAKE_BUILD_TYPE:STRING=Debug »
-D MYSQL_CONFIG_EXECUTABLE=/path/to/my/mysql/server/bin/mysql_config .
```

2. Verify your settings with **cmake -L**:

```
shell> me@host:/path/to/mysql-connector-cpp> cmake -L
[...]
CMAKE_BACKWARDS_COMPATIBILITY:STRING=2.4
CMAKE_BUILD_TYPE:STRING=
CMAKE_INSTALL_PREFIX:PATH=/usr/local
EXECUTABLE_OUTPUT_PATH:PATH=
LIBRARY_OUTPUT_PATH:PATH=
MYSQLCPPCONN_GCOV_ENABLE:BOOL=0
MYSQLCPPCONN_TRACE_ENABLE:BOOL=0
MYSQL_CONFIG_EXECUTABLE=/path/to/my/mysql/server/bin/mysql_config
```

Proceed by carrying out a **make clean** command followed by a **make** command, as described above.

Once you have installed MySQL Connector/C++ you can carry out a quick test to check the installation. To do this you can compile and run one of the example programs, such as `examples/standalone_example.cpp`. This example is discussed in more detail later, but for now you can use it to test the connector has been correctly installed. This procedure assumes you have a working MySQL Server that you can connect to.

1. First compile the example. To do this change to the `examples` directory and type:

```
shell> g++ -o test_install -I/usr/local/include -I/usr/local/include/cppconn -Wl,-Bdynamic -lmysqlcppconn standalone_example.cpp
```

2. You need to make sure the dynamic library which is used in this case can be found at run time. To do this enter:

```
shell> export LD_LIBRARY_PATH=/usr/local/lib
```

3. Now run the program to test your installation, exchanging the host, user, password and database to be accessed given below to match your system:

```
./test_install localhost root password database
```

You will see something similar to the following:

```
Connector/C++ standalone program example...
...
... running 'SELECT 'Welcome to Connector/C++' AS _message'
... MySQL replies: Welcome to Connector/C++
... say it again, MySQL
....MySQL replies: Welcome to Connector/C++
...
... find more at http://www.mysql.com
```

If you see any errors take note of them and go through the troubleshooting procedures discussed earlier.

22.5.2.2. Building source on Windows

Note

Please note the only compiler formally supported for Windows is Microsoft Visual Studio 2003 and above.

The basic steps for building the connector on Windows are the same as for Unix. It is important to use `CMake` 2.6.2 or newer to generate build files for your compiler and to invoke the compiler.

Note

On Windows, `mysql_config` is not present, so `CMake` will attempt to retrieve the location of MySQL from the environment variable `$ENV{MYSQL_DIR}`. If `MYSQL_DIR` is not set, `CMake` will then proceed to check for MySQL in the following locations: `$ENV{ProgramFiles}/MySQL/*/include`, and `$ENV{SystemDrive}/MySQL/*/include`.

`CMake` makes it easy for you to try other compilers. However, you may experience compile warnings, compile errors or linking issues not detected by Visual Studio. Patches are gratefully accepted to fix issues with other compilers.

Consult the `CMake` manual or check `cmake --help` to find out which build systems are supported by your `CMake` version:

```
C:\>cmake --help
cmake version 2.6-patch 2
Usage
[...]
Generators

The following generators are available on this platform:
  Borland Makefiles      = Generates Borland makefiles.
  MSYS Makefiles         = Generates MSYS makefiles.
  MinGW Makefiles        = Generates a make file for use with
                           mingw32-make.
  NMake Makefiles         = Generates NMake makefiles.
  Unix Makefiles          = Generates standard UNIX makefiles.
  Visual Studio 6          = Generates Visual Studio 6 project files.
  Visual Studio 7          = Generates Visual Studio .NET 2002 project
                           files.
  Visual Studio 7 .NET 2003 = Generates Visual Studio .NET 2003 project
                           files.
  Visual Studio 8 2005      = Generates Visual Studio .NET 2005 project
                           files.
  Visual Studio 8 2005 Win64 = Generates Visual Studio .NET 2005 Win64
                           project files.
  Visual Studio 9 2008      = Generates Visual Studio 9 2008 project fil
```

```
Visual Studio 9 2008 Win64 = Generates Visual Studio 9 2008 Win64 project files.  
[...]
```

It is likely that your [CMake](#) binary will support more compilers, known by [CMake](#) as *generators*, than supported by MySQL Connector/C++. We have built the connector using the following generators:

- Microsoft Visual Studio 8 (Visual Studio 2005)
- Microsoft Visual Studio 9 (Visual Studio 2008, Visual Studio 2008 Express)
- NMake

Please see the building instructions for Unix, Solaris and Mac OS X for troubleshooting and configuration hints.

The steps to build the connector are given below:

1. Run [CMake](#) to generate build files for your *generator*:

Visual Studio

```
C:\path_to_mysql_cpp>cmake -G "Visual Studio 9 2008"  
-- Check for working C compiler: cl  
-- Check for working C compiler: cl -- works  
-- Detecting C compiler ABI info  
-- Detecting C compiler ABI info - done  
-- Check for working CXX compiler: cl  
-- Check for working CXX compiler: cl -- works  
-- Detecting CXX compiler ABI info  
-- Detecting CXX compiler ABI info - done  
-- ENV[MYSQL_DIR] =  
-- MySQL Include dir: C:/Programme/MySQL/MySQL Server 5.1/include  
-- MySQL Library : C:/Progams/MySQL/MySQL Server 5.1/lib/opt/mysqlclient.lib

```

22.5.2.3. Dynamically Linking MySQL Connector/C++ against the MySQL Client Library

Note

Note this section refers to dynamic linking of the MySQL Connector/C++ with the client library, not the dynamic linking of the application to MySQL Connector/C++.

An application that uses MySQL Connector/C++ can be either statically or dynamically linked to the MySQL Connector/C++ libraries. MySQL Connector/C++ is usually statically linked to the underlying MySQL Client Library (or Connector/C). Note, that unless otherwise stated, reference to the MySQL Client Library is also taken to include Connector/C, which is a separately packaged, stand alone version of the MySQL Client Library. From MySQL Connector/C++ version 1.1.0 it is possible to also dynamically link to the underlying MySQL Client Library. The ability of MySQL Connector/C++ to dynamically link to MySQL Client Library is not enabled by default, and enabling this feature is done through a compile time option, when compiling the MySQL Connector/C++ source code.

To use the ability to dynamically link the client library to MySQL Connector/C++ the `MYSQLCLIENT_STATIC_BINDING:BOOL` needs to be defined when building the MySQL Connector/C++ source code:

```
rm CMakeCache.txt
cmake -DMYSQLCLIENT_STATIC_BINDING:BOOL=1 .
make clean
make
make install
```

Note that precompiled binaries of MySQL Connector/C++ use static binding with the client library by default.

Now, in your application, when creating a connection, MySQL Connector/C++ will select and load a client library at runtime. It will choose the client library by searching defined locations and environment variables depending on the host operating system. It is also possible when creating a connection in an application to define an absolute path to the client library to be loaded at runtime. This can be convenient if you have defined a standard location from which you want the client library to be loaded. This is sometimes done to circumvent possible conflicts with other versions of the client library that may be located on the system.

22.5.3. MySQL Connector/C++ Building Windows applications with Microsoft Visual Studio

MySQL Connector/C++ is available as a static or dynamic library to use with your application. This section looks at how to link the library to your application.

Note

To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

Static library

The MySQL Connector/C++ static library file is `mysqlcppconn-static.lib`. This needs to be statically linked with your application. You also need to link against the files `libmysql.dll` and `libmysql.lib`. Once linking has been successfully completed, the application will require access to `libmysql.dll` at run time.

Dynamic library

The MySQL Connector/C++ dynamic library file is `mysqlcppconn.dll`. To build your client application, you must link it with the file `mysqlcppconn.lib`. At run time, the application will require access to the files `mysqlcppconn.dll` and `libmysql.dll`.

Building a MySQL Connector/C++ application with Microsoft Visual Studio

Initially, the procedure for building an application to use either the static or dynamic library is the same. You then carry out some additional steps depending on whether you want to build your application to use the [static](#) or [dynamic](#) library.

1. Select **FILE**, **NEW**, **PROJECT** from the main menu.

Figure 22.62. Creating a New Project

2. In the wizard select **VISUAL C++, WIN32**. From **VISUAL STUDIO INSTALLED TEMPLATES** select the application type **WIN32 CONSOLE APPLICATION**. Enter a name for the application, and then click **OK**, to move to the Win32 Application Wizard.

Figure 22.63. The New Project Dialog Box

3. In the Win32 Application Wizard, click **APPLICATION SETTINGS** and ensure the defaults are selected. The radio button **CONSOLE APPLICATION**, and the checkbox **PRECOMPILED HEADERS** will be selected. Click **FINISH** to close the wizard.

Figure 22.64. The Win32 Application Wizard

- From the drop down list box on the toolbar, change from the default **DEBUG** build to the **RELEASE** build.

Figure 22.65. Selecting the Release Build

- From the main menu select **PROJECT**, **PROPERTIES**. This can also be accessed using the hot key ALT + F7.

Figure 22.66. Selecting Project Properties from the Main Menu

6. Under **CONFIGURATION PROPERTIES**, open the tree view.
7. Select **C++, GENERAL** in the tree view.

Figure 22.67. Setting Properties

8. You now need to ensure that Visual Studio can find the MySQL include directory. This directory includes header files that can optionally be installed when installing MySQL Server.

Figure 22.68. MySQL Include Directory

The screenshot shows a Windows Command Prompt window titled "Command Prompt". The command entered is "C:\mysql\include>dir". The output lists the contents of the "include" directory:

```
C:\mysql\include>dir
 Volume in drive C has no label.
 Volume Serial Number is 9484-B7C3

 Directory of C:\mysql\include

10/12/2008  13:56    <DIR>   .
10/12/2008  13:56    <DIR>   ..
15/11/2008  06:53      10,935 config-win.h
15/11/2008  06:53      4,058 decimal.h
15/11/2008  06:53      3,854 errmsg.h
15/11/2008  06:53      6,954 keycache.h
15/11/2008  06:53      2,819 libmysql.def
10/12/2008  13:56    <DIR>   mysql
15/11/2008  06:53      33,654 mysql.h
15/11/2008  06:53      23,155 mysqld_ename.h
15/11/2008  06:53      23,212 mysqld_error.h
15/11/2008  06:53      20,174 mysql_com.h
15/11/2008  06:53      1,130 mysql_embed.h
15/11/2008  06:53      2,097 mysql_time.h
15/11/2008  06:53      860 mysql_version.h
15/11/2008  06:53      1,804 my_alloc.h
15/11/2008  06:53      1,941 my_attribute.h
15/11/2008  06:53      4,576 my_dbug.h
15/11/2008  06:53      3,460 my_dir.h
15/11/2008  06:53      3,278 my_getopt.h
15/11/2008  06:53      50,497 my_global.h
15/11/2008  06:53      1,488 my_list.h
15/11/2008  06:53      3,656 my_net.h
15/11/2008  06:53      1,542 my_no_pthread.h
15/11/2008  06:53      26,468 my_pthread.h
15/11/2008  06:53      40,097 my_sys.h
15/11/2008  06:53      2,677 my_xml.h
15/11/2008  06:53      22,584 m_ctype.h
15/11/2008  06:53      8,256 m_string.h
15/11/2008  06:53      1,957 sql_common.h
15/11/2008  06:53      12,484 sql_state.h
15/11/2008  06:53      1,006 sslopt-case.h
15/11/2008  06:53      2,205 sslopt-longopts.h
15/11/2008  06:53      1,107 sslopt-vars.h
15/11/2008  06:53      1,501 typelib.h

               32 File(s)   325,486 bytes
                 3 Dir(s)   4,091,248,640 bytes free

C:\mysql\include>
```

9. Then in the **ADDITIONAL INCLUDE DIRECTORIES** text field, add the MySQL [include](#) directory.

Figure 22.69. Select Directory Dialog

10. You will also need to set the location of additional libraries that Visual Studio will need to build the application. These are located in the MySQL `lib/opt` directory, a sub-directory of the MySQL Server installation directory.

Figure 22.70. Typical Contents of MySQL lib/opt Directory

```
C:\mysql\lib\opt>dir
 Volume in drive C has no label.
 Volume Serial Number is 9484-B7C3

 Directory of C:\mysql\lib\opt

10/12/2008  13:56    <DIR>    .
10/12/2008  13:56    <DIR>    ..
15/11/2008  06:53      34,876  libmysql.lib
15/11/2008  06:53      6,590,464  libmysql.pdb
15/11/2008  06:53      7,710,426  mysqlclient.lib
15/11/2008  06:53      397,312  mysqlclient.pdb
15/11/2008  06:53      2,675,708  mysys.lib
15/11/2008  06:53      135,168  mysys.pdb
15/11/2008  06:53      235,420  regex.lib
15/11/2008  06:53      77,824  regex.pdb
15/11/2008  06:53      2,566,162  strings.lib
15/11/2008  06:53      86,016  strings.pdb
15/11/2008  06:53      202,226  zlib.lib
15/11/2008  06:53      69,632  zlib.pdb
               12 File(s)   20,781,234 bytes
                2 Dir(s)   4,091,240,448 bytes free

C:\mysql\lib\opt>
```

11. In the tree view open **LINKER, GENERAL, ADDITIONAL LIBRARY DIRECTORIES**.

Figure 22.71. Additional Library Directories

12. Add the `lib/opt` directory into the **ADDITIONAL LIBRARY DIRECTORIES** text field. This enables the library file `libmysql.lib` to be found.

Figure 22.72. Additional Library Directories Dialog

The remaining steps depend on whether you are building an application to use the MySQL Connector/C++ static or dynamic library. If you are building your application to use the dynamic library [go here](#). If you are building your application to use the static library, carry out the following steps:

1. Then open **LINKER, INPUT, ADDITIONAL DEPENDENCIES**.

Figure 22.73.

2. Enter `mysqlcppconn-static.lib` and `libmysql.lib`.

Figure 22.74. Adding Additional Dependencies

3. By default `CPPCONN_PUBLIC_FUNC` is defined to declare functions to be compatible with an application that calls a DLL. If building an application to call the static library, you must ensure that function prototypes are compatible with this. In this case `CPPCONN_PUBLIC_FUNC` needs to be defined to be an empty string, so that functions are declared with the correct prototype.

In the **PROJECT, PROPERTIES** tree view, under **C++, PREPROCESSOR**, enter `CPPCONN_PUBLIC_FUNC=` into the PREPROCESSOR DEFINITIONS text field.

Figure 22.75. Setting the CPPCONN_PUBLIC_FUNC Define

Note

Make sure you enter `CPPCONN_PUBLIC_FUNC=` and not `CPPCONN_PUBLIC_FUNC`, as it needs to be defined as an empty string.

If building an application to use the MySQL Connector/C++ dynamically linked library carry out these steps:

1. Under **LINKER, INPUT**, add `mysqlcppconn.lib` into the **ADDITIONAL DEPENDENCIES** text field.
2. The application will need to access the MySQL Connector/C++ Dynamic Linked Library at run time. Therefore, `mysqlcppconn.dll` needs to be in the same directory as the application executable, or somewhere on the system's path.

Copy `mysqlcppconn.dll` to the same directory as the application. Alternatively, extend the `PATH` environment variable using `SET PATH=%PATH%;C:\path\to\cpp`. Alternatively, you can copy `mysqlcppconn.dll` to the Windows installation Directory, typically `c:\windows`.

22.5.4. MySQL Connector/C++ Building Linux applications with NetBeans

This section describes how you can build MySQL Connector/C++ applications for Linux using the NetBeans IDE.

Figure 22.76. The NetBeans IDE

Note

To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

1. The first step of building your application is to create a new project. Select **FILE**, **NEW PROJECT**. Choose a **C/C++ APPLICATION** and click **NEXT**.
2. Give the project a name and click **FINISH**. A new project is created.
3. In the **PROJECTS** tab, right-click **SOURCE FILES** and select **NEW**, then **MAIN C++ FILE...**
4. Change the filename, or simply select the defaults and click **FINISH** to add the new file to the project.
5. You now need to add some working code to your main source file. Explore your MySQL Connector/C++ installation and navigate to the **examples** directory.
6. Select a suitable example such as **standalone_example_docs1.cpp**. Copy all the code in this file, and use it to replace the code in your existing main source file. Amend the code to reflect the connection properties required for your test database. You now have a working example that will access a MySQL database using MySQL Connector/C++.
7. You will notice that at this point NetBeans is showing some errors in the source code. This is because you need to direct NetBeans to the necessary header files that need to be included. Select **FILE**, **PROJECT PROPERTIES** from the main menu.
8. In the **CATEGORIES**: tree view panel, navigate to **BUILD**, **C++ COMPILER**.
9. In the **GENERAL** panel, select **INCLUDE DIRECTORIES**.
10. Click the ... button.
11. Click **ADD** and then navigate to the directory where the MySQL Connector/C++ header files are located. This will be **/usr/local/include** unless you have installed the files to a different location. Click **SELECT**. Click **OK**.

Figure 22.77. Setting the Header Include Directory

12. Click OK again to close the **PROJECT PROPERTIES** dialog.

At this point you have created a NetBeans project, containing a single C++ source file. You have also ensured that the necessary include files are accessible. Before continuing, you need to decide whether your project is to use the MySQL Connector/C++ static or dynamic library. The project settings are slightly different in each case, as you need to link against a different library.

Using the static library

If you intend to use the static library you will need to link against two library files, `libmysqlcppconn-static.a` and `libmysqlclient.a`. The locations of the files will depend on your setup, but typically the former will be found in `/usr/local/lib` and the latter in `/usr/lib`. Note the file `libmysqlclient.a` is not part of MySQL Connector/C++, but is the MySQL Client Library file distributed with MySQL Server. Remember, the MySQL Client Library is an optional component as part of the MySQL Server installation process. Note the MySQL Client Library is also available as part of the new MySQL Connector/C distribution.

1. The first step is to set the project to link the necessary library files. Select **FILE**, **PROJECT PROPERTIES** from the main menu.
2. In the **CATEGORES:** tree view navigate to **LINKER**.
3. In the **GENERAL** panel select **ADDITIONAL LIBRARY DIRECTORIES**. Click the ... button.
4. Select and add the `/usr/lib` and `/usr/local/lib` directories.
5. In the same panel add the two library files required for static linking as discussed earlier. The properties panel should then look similar to the following screenshot:

Figure 22.78. Setting the Static Library Directories and File Names

- Click OK to close the **PROJECT PROPERTIES** dialog.

Using the dynamic library

If you require your application to use the MySQL Connector/C++ dynamic library, you simply need to link your project with a single library file, `libmysqlcppconn.so`. The location of this file will depend on how you configured your installation of MySQL Connector/C++, but will typically be `/usr/local/lib`.

- The first step is to set the project to link the necessary library file. Select **FILE**, **PROJECT PROPERTIES** from the main menu.
- In the **CATEGORIES:** tree view navigate to **LINKER**.
- In the **GENERAL** panel select **ADDITIONAL LIBRARY DIRECTORIES**. Click the ... button.
- Select and add the `/usr/local/lib` directories.
- In the same panel add the library file required for static linking as discussed earlier. The properties panel should then look similar to the following screenshot:

Figure 22.79. Setting the Dynamic Library Directory and File Name

- Click OK to close the Project Properties dialog.

Having configured your project you can build it by selecting RUN, BUILD MAIN PROJECT from the main menu. You can then run the project using RUN, RUN MAIN PROJECT.

On running the application you should see a screen similar to the following (this is actually the static version of the application shown):

Figure 22.80. The Example Application Running

```
▼ dist/Debug/GNU-Linux-x86/test_static
Running 'SELECT 'Hello World!' AS _message'...
... MySQL replies: Hello World!
... MySQL says it again: Hello World!

[Press Enter to close window]■
```

Note

Note the above settings and procedures were carried out for the default `Debug` configuration. If you want to create a `Release` configuration you will need to select that configuration before setting the Project Properties.

22.5.5. MySQL Connector/C++ Getting Started: Usage Examples

The download package contains usage examples in the directory `examples/`. The examples explain the basic usage of the following classes:

- `Connection`
- `Driver`
- `PreparedStatement`
- `ResultSet`
- `ResultSetMetaData`
- `Statement`

The examples cover:

- Using the `Driver` class to connect to MySQL
- Creating tables, inserting rows, fetching rows using (simple) statements
- Creating tables, inserting rows, fetching rows using prepared statements
- Hints for working around prepared statement limitations
- Accessing result set metadata

The examples in this document are only code snippets. The code snippets provide a brief overview on the API. They are not complete programs. Please check the `examples/` directory of your MySQL Connector/C++ installation for complete programs. Please also read the `README` file in the `examples/` directory. Note to test the example code you will first need to edit the `examples.h` file in the `examples/` directory, to add your connection information. Then simply rebuild the code by issuing a `make` command.

The examples in the `examples/` directory include:

- `examples/connect.cpp`:

How to create a connection, insert data into MySQL and handle exceptions.

- `examples/connection_meta_schemaobj.cpp`:

How to obtain metadata associated with a connection object, for example, a list of tables, databases, MySQL version, connector version.

- `examples/debug_output.cpp`:

How to activate and deactivate the MySQL Connector/C++ debug protocol.

- `examples/exceptions.cpp`:

A closer look at the exceptions thrown by the connector and how to fetch error information.

- `examples/prepared_statements.cpp`:

How to run Prepared Statements including an example how to handle SQL commands that cannot be prepared by the MySQL Server.

- `examples/resultset.cpp`:

How to fetch data and iterate over the result set (cursor).

- `examples/resultset_meta.cpp`:

How to obtain metadata associated with a result set, for example, number of columns and column types.

- `examples/resultset_types.cpp`:

Result sets returned from metadata methods - this is more a test than much of an example.

- `examples/standalone_example.cpp`:

Simple standalone program not integrated into regular `CMake` builds.

- `examples/statements.cpp`:

How to run SQL commands without using Prepared Statements.

- `examples/cpp_trace_analyzer.cpp`:

This example shows how to filter the output of the `debug trace`. Please see the inline comments for further documentation. This script is unsupported.

22.5.5.1. MySQL Connector/C++ Connecting to MySQL

A connection to MySQL is established by retrieving an instance of `sql::Connection` from a `sql::mysql::MySQL_Driver` object. A `sql::mysql::MySQL_Driver` object is returned by `sql::mysql::MySQL_Driver::get_mysql_driver_instance()`.

```
sql::mysql::MySQL_Driver *driver;
sql::Connection *con;

driver = sql::mysql::MySQL_Driver::get_mysql_driver_instance();
con = driver->connect("tcp://127.0.0.1:3306", "user", "password");
delete con;
```

Make sure that you free the `sql::Connection` object as soon as you do not need it any more. But do not explicitly free the connector object!

22.5.5.2. MySQL Connector/C++ Running a simple query

For running simple queries you can use the methods `sql::Statement::execute()`, `sql::Statement::executeQuery()` and `sql::Statement::executeUpdate()`. The method `sql::Statement::execute()` should be used if your query does not return a result set or if your query returns more than one result set. See the `examples/` directory for more on this.

```
sql::mysql::MySQL_Driver *driver;
sql::Connection *con;
sql::Statement *stmt;

driver = sql::mysql::get_mysql_driver_instance();
con = driver->connect("tcp://127.0.0.1:3306", "user", "password");

stmt = con->createStatement();
stmt->execute("USE " EXAMPLE_DB);
stmt->execute("DROP TABLE IF EXISTS test");
stmt->execute("CREATE TABLE test(id INT, label CHAR(1))");
stmt->execute("INSERT INTO test(id, label) VALUES (1, 'a')");

delete stmt;
delete con;
```

Note that you have to free `sql::Statement` and `sql::Connection` objects explicitly using delete.

22.5.5.3. MySQL Connector/C++ Fetching results

The API for fetching result sets is identical for (simple) statements and prepared statements. If your query returns one result set you should use `sql::Statement::executeQuery()` or `sql::PreparedStatement::executeQuery()` to run your query. Both methods return `sql::ResultSet` objects. The preview version does buffer all result sets on the client to support cursors.

```
// ...
sql::Connection *con;
sql::Statement *stmt;
sql::ResultSet *res;
// ...
stmt = con->createStatement();
// ...

res = stmt->executeQuery("SELECT id, label FROM test ORDER BY id ASC");
while (res->next()) {
    // You can use either numeric offsets...
    cout << "id = " << res->getInt(1); // getInt(1) returns the first column
    // ... or column names for accessing results.
    // The latter is recommended.
    cout << ", label = '" << res->getString("label") << "'" << endl;
}

delete res;
delete stmt;
delete con;
```

Note

Note in the preceding code snippet that column indexing starts from 1.

Note that you have to free `sql::Statement`, `sql::Connection` and `sql::ResultSet` objects explicitly using delete.

The usage of cursors is demonstrated in the examples contained in the download package.

22.5.5.4. MySQL Connector/C++ Using Prepared Statements

If you are not familiar with Prepared Statements on MySQL have an extra look at the source code comments and explanations in the file `examples/prepared_statement.cpp`.

`sql::PreparedStatement` is created by passing a SQL query to `sql::Connection::prepareStatement()`. As `sql::PreparedStatement` is derived from `sql::Statement`, you will feel familiar with the API once you have learned how to use (simple) statements (`sql::Statement`). For example, the syntax for fetching results is identical.

```
// ...
sql::Connection *con;
sql::PreparedStatement *prep_stmt
// ...

prep_stmt = con->prepareStatement("INSERT INTO test(id, label) VALUES (?, ?)");

prep_stmt->setInt(1, 1);
prep_stmt->setString(2, "a");
```

```

prep_stmt->execute();
prep_stmt->setInt(1, 2);
prep_stmt->setString(2, "b");
prep_stmt->execute();

delete prep_stmt;
delete con;

```

As usual, you have to free `sql::PreparedStatement` and `sql::Connection` objects explicitly.

22.5.5.5. MySQL Connector/C++ Complete Example 1

The following code shows a complete example of how to use MySQL Connector/C++:

```

/* Standard C++ includes */
#include <stdlib.h>
#include <iostream>

/*
   Include directly the different
   headers from cppconn/ and mysql_driver.h + mysql_util.h
   (and mysql_connection.h). This will reduce your build time!
*/
#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>

using namespace std;

int main(void)
{
cout << endl;
cout << "Running 'SELECT 'Hello World!'" <<
     AS _message'..." << endl;

try {
    sql::Driver *driver;
    sql::Connection *con;
    sql::Statement *stmt;
    sql::ResultSet *res;

    /* Create a connection */
    driver = get_driver_instance();
    con = driver->connect("tcp://127.0.0.1:3306", "root", "root");
    /* Connect to the MySQL test database */
    con->setSchema("test");

    stmt = con->createStatement();
    res = stmt->executeQuery("SELECT 'Hello World!' AS _message");
    while (res->next()) {
        cout << "\t... MySQL replies: ";
        /* Access column data by alias or column name */
        cout << res->getString("_message") << endl;
        cout << "\t... MySQL says it again: ";
        /* Access column data by numeric offset, 1 is the first column */
        cout << res->getString(1) << endl;
    }
    delete res;
    delete stmt;
    delete con;
} catch (sql::SQLException &e) {
    cout << "# ERR: SQLException in " << __FILE__;
    cout << "(" << __FUNCTION__ << ")" on line " >
         << __LINE__ << endl;
    cout << "# ERR: " << e.what();
    cout << " (MySQL error code: " << e.getErrorCode();
    cout << ", SQLState: " << e.getSQLState() << ")" << endl;
}

```

```

    }

cout << endl;

return EXIT_SUCCESS;
}

```

22.5.5.6. MySQL Connector/C++ Complete Example 2

The following code shows a complete example of how to use MySQL Connector/C++:

```

/* Standard C++ includes */
#include <stdlib.h>
#include <iostream>

/*
 * Include directly the different
 * headers from cppconn/ and mysql_driver.h + mysql_util.h
 * (and mysql_connection.h). This will reduce your build time!
 */
#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>
#include <cppconn/prepared_statement.h>

using namespace std;

int main(void)
{
    cout << endl;
    cout << "Let's have MySQL count from 10 to 1..." << endl;

    try {
        sql::Driver *driver;
        sql::Connection *con;
        sql::Statement *stmt;
        sql::ResultSet *res;
        sql::PreparedStatement * pstmt;

        /* Create a connection */
        driver = get_driver_instance();
        con = driver->connect("tcp://127.0.0.1:3306", "root", "root");
        /* Connect to the MySQL test database */
        con->setSchema("test");

        stmt = con->createStatement();
        stmt->execute("DROP TABLE IF EXISTS test");
        stmt->execute("CREATE TABLE test(id INT)");
        delete stmt;

        /* '?' is the supported placeholder syntax */
        pstmt = con->prepareStatement("INSERT INTO test(id) VALUES (?)");
        for (int i = 1; i <= 10; i++) {
            pstmt->setInt(1, i);
            pstmt->executeUpdate();
        }
        delete pstmt;

        /* Select in ascending order */
        pstmt = con->prepareStatement("SELECT id FROM test ORDER BY id ASC");
        res = pstmt->executeQuery();

        /* Fetch in reverse = descending order! */
        res->afterLast();
        while (res->previous())
            cout << "\t... MySQL counts: " << res->getInt("id") << endl;
        delete res;

        delete pstmt;
    }
}

```

```

    delete con;

} catch (sql::SQLException &e) {
    cout << "# ERR: SQLException in " << __FILE__;
    cout << "(" << __FUNCTION__ << ")" on line " >
        << __LINE__ << endl;
    cout << "# ERR: " << e.what();
    cout << "(MySQL error code: " << e.getErrorCode();
    cout << ", SQLState: " << e.getSQLState() << "
        " )" << endl;
}

cout << endl;

return EXIT_SUCCESS;
}

```

22.5.6. MySQL Connector/C++ Tutorials

Here are some tutorials on using MySQL Connector/C++. You should also have a look at the examples which can be found in the following section [Section 22.5.5, “MySQL Connector/C++ Getting Started: Usage Examples”](#).

Setting up the World database for use in the tutorials

These tutorials primarily use the `World` database, so you need to have that installed. You can download the `World` database, and documentation on how to install it, from the [MySQL Documentation](#) page - look for the section called “Example Databases”.

Tutorial framework code

Rather than repeating the same code, a framework is given here. You can reuse this framework with all the tutorials unless otherwise stated. This boiler plate code can then simply be reused for each tutorial.

The framework code is given here:

```

#include <stdlib.h>
#include <iostream>
#include <sstream>
#include <stdexcept>

#include "mysql_connection.h"

#include <cppconn/driver.h>
#include <cppconn/exception.h>
#include <cppconn/resultset.h>
#include <cppconn/statement.h>
#include <cppconn/prepared_statement.h>

#define EXAMPLE_HOST "localhost"
#define EXAMPLE_USER "root"
#define EXAMPLE_PASS ""
#define EXAMPLE_DB "world"

using namespace std;

int main(int argc, const char **argv)
{
    string url(argc >= 2 ? argv[1] : EXAMPLE_HOST);
    const string user(argc >= 3 ? argv[2] : EXAMPLE_USER);
    const string pass(argc >= 4 ? argv[3] : EXAMPLE_PASS);
    const string database(argc >= 5 ? argv[4] : EXAMPLE_DB);

    cout << "Connector/C++ tutorial framework..." << endl;
    cout << endl;

    try {
        /* INSERT TUTORIAL CODE HERE! */

    } catch (sql::SQLException &e) {
        /*
         * The MySQL Connector/C++ throws three different exceptions:
         *
         * - sql::MethodNotImplementedException (derived from sql::SQLException)
         * - sql::InvalidArgumentException (derived from sql::SQLException)
         * - sql::SQLException (derived from std::runtime_error)
         */
        cout << "# ERR: SQLException in " << __FILE__;
        cout << "(" << __FUNCTION__ << ")" on line " << __LINE__ << endl;
        /* Use what() (derived from std::runtime_error) to fetch the error message */
        cout << "# ERR: " << e.what();
        cout << "(MySQL error code: " << e.getErrorCode();
        cout << ", SQLState: " << e.getSQLState() << ")" << endl;

        return EXIT_FAILURE;
    }
}

```

```

        cout << "Done." << endl;
        return EXIT_SUCCESS;
    }
}

```

To compile and run the framework

First, copy and paste the framework code to a file such as `frmwk.cpp`. Edit the `#define` statements to reflect your connection details (server, user, password, database).

To compile the framework, for example on Mac OS X, type:

```
shell> g++ -o frmwk -I/usr/local/include -I/usr/local/include/cppconn -lmysqlcppconn frmwk.cpp
```

To run the framework, enter the following:

```
shell> ./frmwk
```

You will see a simple message. You are now ready to continue to the tutorials.

22.5.6.1. Tutorial: Calling Stored Procedures with Statements in MySQL Connector/C++

Stored Procedures can be called using both Statements and Prepared Statements. This tutorial looks at calling Stored Procedures using Statements. The following tutorial [Section 22.5.6.2, “Tutorial: Calling Stored Procedures with Prepared Statements in MySQL Connector/C++”](#) will cover the use of Prepared Statements.

When considering calling Stored Procedures there are several scenarios that can occur:

1. A Stored Procedure that does not return a result set.
2. A Stored Procedure that returns an output parameter.
3. A Stored Procedure that returns a result set.

Stored Procedures are given below that illustrate each of the above scenarios.

The following routine enables you to add a country into the World database, but does not return a result. This corresponds to Scenario 1 above.

```
CREATE PROCEDURE add_country (IN country_code CHAR(3), IN country_name CHAR(52), IN continent_name CHAR(30))
BEGIN
    INSERT INTO Country(Code, Name, Continent) VALUES (country_code, country_name, continent_name);
END
```

The next routine returns the population of a specified country, and corresponds to Scenario 2 above:

```
CREATE PROCEDURE get_pop (IN country_name CHAR(52), OUT country_pop INT(11))
BEGIN
    SELECT Population INTO country_pop FROM Country WHERE Name = country_name;
END
```

The next routine is an example of a procedure returning a result set containing multiple records. This routine corresponds to Scenario 3 above.

```
CREATE PROCEDURE get_data ()
BEGIN
    SELECT Code, Name, Population, Continent FROM Country WHERE Continent = "Oceania" AND Population < 10000;
    SELECT Code, Name, Population, Continent FROM Country WHERE Continent = "Europe" AND Population < 10000;
    SELECT Code, Name, Population, Continent FROM Country WHERE Continent = "North America" AND Population < 10000
END
```

Enter and test the Stored Procedures to ensure no errors have been introduced. You are now ready to start writing routines to test out the use of Stored Procedures using Connector/C++.

Scenario 1 - Stored Procedure does not return a result set

In the first case you will examine Scenario 1, you call a Stored procedure that does not return a result set.

1. Make a copy of the tutorial framework code.
2. Insert the following code into the framework at the correct location (denoted by an INSERT HERE comment in the framework).

```
sql::Driver* driver = get_driver_instance();
std::auto_ptr<sql::Connection> con(driver->connect(url, user, pass));
con->setSchema(database);
std::auto_ptr<sql::Statement> stmt(con->createStatement());

// We don't need to check the return value explicitly, if it indicates
// an error Connector/C++ will generate an exception.
stmt->execute("CALL add_country(\"ATL\", \"Atlantis\", \"North America\")");
```

3. Compile the program using the following command:

```
shell> g++ -o sp_scenario1 -I/usr/local/include/cppconn/ -lmysqlcppconn sp_scenario1.cpp
```

4. Run the program by typing:

```
shell> ./sp_scenario1
```

5. Using the MySQL Command Line Client, or other suitable tool, check the World database to determine that it has been updated correctly. You can use a query such as:

```
SELECT Code, Name, Continent FROM Country WHERE Code="ATL";
```

The code in this case simply creates a statement and then invokes the execute method on it, passing the call to the Stored Procedure as a parameter. The Stored Procedure itself does not return a value, although it is important to note there will always be a return value from the call - this is simply the call status. MySQL Connector/C++ handles this status for you, so you do not need code to handle it explicitly. If the call should fail for some reason an exception will be raised, and this will be handled by the `catch` statement in the code.

Scenario 2 - Stored Procedure returns an output parameter

You will now see how to handle a Stored Procedure that returns an output parameter.

1. Enter the following code into the tutorial framework code:

```
sql::Driver* driver = get_driver_instance();
std::auto_ptr<sql::Connection> con(driver->connect(url, user, pass));
con->setSchema(database);
std::auto_ptr<sql::Statement> stmt(con->createStatement());

stmt->execute("CALL get_pop(\"Uganda\", @pop)");

std::auto_ptr<sql::ResultSet> res(stmt->executeQuery("SELECT @pop AS _reply"));
while (res->next())
    cout << "Population of Uganda: " << res->getString("_reply") << endl;

stmt->execute("CALL get_pop_continent(\"Asia\", @pop)");
res.reset(stmt->executeQuery("SELECT @pop AS _reply"));
while (res->next())
    cout << "Population of Asia: " << res->getString("_reply") << endl;

stmt->execute("CALL get_world_pop(@pop)");
res.reset(stmt->executeQuery("SELECT @pop AS _reply"));
while (res->next())
    cout << "Population of World: " << res->getString("_reply") << endl;
```

2. Compile the program using the following command:

```
shell> g++ -o sp_scenario2 -I/usr/local/include/cppconn/ -lmysqlcppconn sp_scenario2.cpp
```

3. Run the program by typing:

```
shell> ./sp_scenario2
```

Note the output generated by the program.

In this scenario the Stored Procedure sets an output parameter. This is not returned as such, but needs to be obtained using a query. If running the SQL statements directly this might be similar to the following:

```
CALL get_world_pop(@pop);
SELECT @pop;
```

In the C++ code a similar sequence is carried out. First, the `CALL` is executed as seen earlier. To obtain the output parameter an additional query must be executed. This query results in a `ResultSet` that can then be processed in a `while` loop. The simplest way to retrieve the data in this case is to use a `getString` method on the `ResultSet`, passing the name of the variable to access. In this example `_reply` is used as a placeholder for the variable and therefore is used as the key to access the correct element of the result dictionary.

Scenario 3 - Stored Procedure returns a Result Set

You will now see how to handle a Stored Procedure that returns a result set.

- Enter the following code into the tutorial framework code:

```
sql::Driver* driver = get_driver_instance();
std::auto_ptr<sql::Connection> con(driver->connect(url, user, pass));
con->setSchema(database);
std::auto_ptr<sql::Statement> stmt(con->createStatement());

stmt->execute("CALL get_stats()");
std::auto_ptr<sql::ResultSet> res;
do {
    res.reset(stmt->getResultSet());
    while (res->next()) {
        cout << "Result: " << res->getString(1) << endl;
    }
} while (stmt->getMoreResults());
```

- Compile the program using the following command:

```
shell> g++ -o sp_scenario3 -I/usr/local/include/cppconn/ -lmysqlcppconn sp_scenario3.cpp
```

- Run the program by typing:

```
shell> ./sp_scenario3
```

Note the output generated by the program.

The code is similar to the examples you have previously seen. The code of particular interest in this case is:

```
do {
    res.reset(stmt->getResultSet());
    while (res->next()) {
        cout << "Name: " << res->getString("Name")
            << " Population: " << res->getInt("Population")
            << endl;
    }
} while (stmt->getMoreResults());
```

The `CALL` is executed as before, with the results being returned into multiple `ResultSets`. This is because the Stored Procedure in this case uses multiple `SELECT` statements. In this example the output shows that three Result Sets are processed, because there are three `SELECT` statements in the Stored Procedure. All of the Result Sets have more than one row.

Studying the code it should be noted that the results are processed using the pattern:

```
do {
    Get Result Set
    while (Get Result) {
        Process Result
    }
} while (Get More Result Sets);
```

Note

Note this pattern would be used even if the Stored Procedure carried out a single `SELECT` and you knew there was

■ only one result set. This is a requirement of the underlying protocol.

22.5.6.2. Tutorial: Calling Stored Procedures with Prepared Statements in MySQL Connector/C++

Before working through this tutorial it is recommended you first work through the previous tutorial [Section 22.5.6.1, “Tutorial: Calling Stored Procedures with Statements in MySQL Connector/C++”](#).

Scenario 1 - Using a Prepared Statement to prepare a Stored Procedure that does not return a result set

1. Add the following code to the `try` block of the tutorial framework:

```

vector<string> code_vector;
code_vector.push_back("SLD");
code_vector.push_back("DSN");
code_vector.push_back("ATL");

vector<string> name_vector;
name_vector.push_back("Sealand");
name_vector.push_back("Disneyland");
name_vector.push_back("Atlantis");

vector<string> cont_vector;
cont_vector.push_back("Europe");
cont_vector.push_back("North America");
cont_vector.push_back("Oceania");

sql::Driver * driver = get_driver_instance();

std::auto_ptr< sql::Connection > con(driver->connect(url, user, pass));
con->setSchema(database);

std::auto_ptr< sql::PreparedStatement > pstmt;

pstmt.reset(con->prepareStatement("CALL add_country(?, ?, ?)"));
for (int i=0; i<3; i++)
{
    pstmt->setString(1,code_vector[i]);
    pstmt->setString(2,name_vector[i]);
    pstmt->setString(3,cont_vector[i]);

    pstmt->execute();
}

```

You will also need to add `#include <vector>` to the top of your code as vectors are used to store sample data.

2. Compile the code using the following command:

```
g++ -o ps_scenario1 -I/usr/local/include/cppconn/ -lmysqlcppconn ps_scenario1.cpp
```

3. Run the code using the command:

```
./ps_scenario1
```

4. You can test the database has been updated correctly by using a query such as:

```
SELECT Code, Name, Continent FROM Country WHERE Code = "DSN" OR Code="ATL" OR Code="SLD";
```

The code is relatively simple, as no processing is required to handle Result Sets. The procedure call, `CALL add_country(?, ?, ?)`, is made using placeholders for input parameters denoted by '?'. These placeholders are replaced by values using the Prepared Statement's `setString` method in this case. The `for` loop is set up to iterate 3 times, as there are three data sets in this example. The same Prepared Statement is executed three times, each time with different input parameters.

Scenario 2 - Using a Prepared Statement to prepare a Stored Procedure that uses an output parameter

In this scenario a different Stored Procedure is going to be used compared to the one used in the tutorial [Section 22.5.6.1, “Tutorial: Calling Stored Procedures with Statements in MySQL Connector/C++”](#). This is to illustrate passing an input parameter as well as fetching an output parameter. The stored routine is as follows:

```

CREATE PROCEDURE get_pop_continent (IN continent_name CHAR(30), OUT continent_pop INT(11))
BEGIN
    SELECT SUM(Population) INTO continent_pop FROM Country WHERE Continent = continent_name;
END

```

1. Copy the following code into the `try` block of the tutorial framework code:

```

vector<string> cont_vector;
cont_vector.push_back("Europe");
cont_vector.push_back("North America");
cont_vector.push_back("Oceania");

sql::Driver * driver = get_driver_instance();

std::auto_ptr< sql::Connection > con(driver->connect(url, user, pass));
con->setSchema(database);

std::auto_ptr< sql::Statement > stmt(con->createStatement());
std::auto_ptr< sql::PreparedStatement > pstmt;
std::auto_ptr< sql::ResultSet > res;

pstmt.reset(con->prepareStatement("CALL get_pop_continent(?,@pop)"));

for (int i=0; i<3; i++)
{
    pstmt->setString(1,cont_vector[i]);
    pstmt->execute();
    res.reset(stmt->executeQuery("SELECT @pop AS _population"));
    while (res->next())
        cout << "Population of " << cont_vector[i] << " is " << res->getString("_population") << endl;
}

```

You will also need to add the line `#include <vector>` to the top of the code, as vectors are used in this example.

2. Compile the code using:

```
shell> g++ -o ps_scenario2 -I/usr/local/include/cppconn/ -lmysqlcppconn ps_scenario2.cpp
```

3. Run the code using:

```
shell> ./ps_scenario2
```

4. Make a note of the output.

In this scenario a Prepared Statement is created that calls the Stored Procedure `get_pop_continent`. This procedure takes an input parameter, and also returns an output parameter. The approach used is to create another statement that can be used to fetch the output parameter using a `SELECT` query. Note that when the Prepared Statement is created, the input parameter to the Stored Procedure is denoted by `?`. Prior to execution of Prepared Statement it is necessary to replace this placeholder by an actual value. This is done using methods such as `setString` and `setInt`, for example:

```
pstmt->setString(1,cont_vector[i]);
```

Although for the query used to obtain the output parameter a single result set is expected, it is important to use the `while` loop to catch more than one result, to avoid the possibility of the connection becoming unstable.

Scenario 3 - Using a Prepared Statement to prepare a Stored Procedure that returns multiple Result Sets

Note

Note this scenario is not supported on versions of MySQL prior to 5.5.3. This is due to a limitation in the client/server protocol.

1. Enter the following code into the `try` block of the tutorial framework:

```

sql::Driver * driver = get_driver_instance();

std::auto_ptr< sql::Connection > con(driver->connect(url, user, pass));
con->setSchema(database);

std::auto_ptr< sql::PreparedStatement > pstmt;
std::auto_ptr< sql::ResultSet > res;

pstmt.reset(con->prepareStatement("CALL get_data()"));

res.reset(pstmt->executeQuery());

do {
    res.reset(pstmt->getResultSet());
    while (res->next()) {
        cout << "Name: " << res->getString("Name")
            << " Population: " << res->getInt("Population")
            << endl;
}

```

```

        }
    } while (stmt->getMoreResults());
}

```

2. Compile the code using the following command:

```
shell> g++ -o ps_scenario3 -I/usr/local/include/cppconn/ -lmysqlcppconn ps_scenario3.cpp
```

3. Run the program using the command:

```
shell> ./ps_scenario3
```

4. Make a note of the output generated.

The code executes the Stored Procedure using a Prepared Statement. The standard do-while construct is used to ensure that all Result Sets are fetched. In this case the returned values are fetched from the Result Sets using the `getInt` and `getString` methods.

22.5.7. MySQL Connector/C++ Debug Tracing

Although a debugger can be used to debug your application, you may find it beneficial to turn on the debug traces of the connector. Some problems happen randomly which makes them difficult to debug using a debugger. In such cases debug traces and protocol files are more useful because they allow you to trace the activities of all instances of your program.

DTrace is a very powerful technology to trace any application without having to develop an extra trace module for your application. Unfortunately, DTrace is currently only available on Solaris, MacOS 10.5, and FreeBSD.

The MySQL Connector/C++ can write two trace files:

1. Trace file generated by the MySQL Client Library
2. Trace file generated internally by MySQL Connector/C++

The first trace file can be generated by the underlying MySQL Client Library (libmysql). To enable this trace the connector will call the C-API function `mysql_debug()` internally. Only debug versions of the MySQL Client Library are capable of writing a trace file. Therefore you need to compile MySQL Connector/C++ against a debug version of the library, if you want utilize this trace. The trace shows the internal function calls and the addresses of internal objects as you can see below:

```

>mysql_stmt_init
| >_mymalloc
| | enter: Size: 816
| | exit: ptr: 0x68e7b8
<_mymalloc | >init_alloc_root
| enter: root: 0x68e7b8
| >_mymalloc
| | enter: Size: 2064
| | exit: ptr: 0x68eb28
[...]

```

The second trace is the MySQL Connector/C++ internal trace. It is available with debug and nondebug builds of the connector as long as you have enabled the tracing module at compile time using `cmake -DMYSQLCPPCONN_TRACE_ENABLE:BOOL=1`. By default, the tracing functionality is not available and calls to trace functions are removed by the preprocessor.

Compiling the connector with tracing functionality enabled will cause two additional tracing function calls per each connector function call. You will need to run your own benchmark to find out how much this will impact the performance of your application.

A simple test using a loop running 30,000 INSERT SQL statements showed no significant real-time impact. The two variants of this application using a trace enabled and trace disabled version of the connector performed equally well. The run time measured in real-time was not significantly impacted as long as writing a debug trace was not enabled. However, there will be a difference in the time spent in the application. When writing a debug trace the IO subsystem may become a bottleneck.

In summary, use connector builds with tracing enabled carefully. Trace enabled versions may cause higher CPU usage even if the overall run time of your application is not impacted significantly.

```

| INF: Tracing enabled
<MySQL_Connection::setClientOption
>MySQL_Prepared_Statement::setInt
| INF: this=0x69a2e0
| >MySQL_Prepared_Statement::checkClosed
| <MySQL_Prepared_Statement::checkClosed
| <MySQL_Prepared_Statement::setInt

```

[...]

The example from [examples/debug_output.cpp](#) demonstrates how to activate the debug traces in your program. Currently they can only be activated through API calls. The traces are controlled on a per-connection basis. You can use the `setClientOptions()` method of a connection object to activate and deactivate the generation of a trace. The MySQL Client Library trace is always written into a file, whereas the connector's protocol messages are printed to standard out.

```
sql::Driver *driver;
int on_off = 1;

/* Using the Driver to create a connection */
driver = get_driver_instance();
std::auto_ptr< sql::Connection > con(driver->connect(host, user, pass));

/*
Activate debug trace of the MySQL Client Library (C-API)
Only available with a debug build of the MySQL Client Library!
*/
con->setClientOption("libmysql_debug", "d:t:O,client.trace");

/*
Tracing is available if you have compiled the driver using
cmake -DMYSQLCPPCONN_TRACE_ENABLE:BOOL=1
*/
con->setClientOption("client_trace", &on_off);
```

22.5.8. MySQL Connector/C++ Usage Notes

See the [JDBC overview](#) for information on JDBC 4.0. Please also check the [examples/](#) directory of the download package.

Notes on using the MySQL Connector/C++ API

- `DatabaseMetaData::supportsBatchUpdates()` returns `true` because MySQL supports batch updates in general. However, no API calls for batch updates are provided by the MySQL Connector/C++ API.
- Two non-JDBC methods have been introduced for fetching and setting unsigned integers: `getUInt64()` and `getUInt()`. These are available for `ResultSet` and `PreparedStatement`:

- `ResultSet::getUInt64()`
- `ResultSet::getUInt()`
- `PreparedStatement::setUInt64()`
- `PreparedStatement::setUInt()`

The corresponding `getLong()` and `setLong()` methods have been removed.

- The method `DatabaseMetaData::getColumns()` has 23 columns in its result set, rather than the 22 columns defined by JDBC. The first 22 columns are as described in the JDBC documentation, but column 23 is new:

 23. `IS_AUTOINCREMENT`: String which is “YES” if the column is an auto-increment column. Otherwise the string contains “NO”.

- MySQL Connector/C++ may return different metadata for the same column.

When you have any column that accepts a charset and a collation in its specification and you specify a binary collation, such as:

```
CHAR(250) CHARACTER SET 'latin1' COLLATE 'latin1_bin'
```

The server sets the `BINARY` flag in the result set metadata of this column. The method `ResultSetMetadata::getColumnTypeName()` uses the metadata and will report, due to the `BINARY` flag, that the column type name is `BINARY`. This is illustrated below:

```
mysql> create table varbin(a varchar(20) character set utf8 collate utf8_bin);
Query OK, 0 rows affected (0.00 sec)

mysql> select * from varbin;
Field 1: `a`
Catalog: `def`
Database: `test`
Table: `varbin`
Org_table: `varbin`
Type: VAR_STRING
Collation: latin1_swedish_ci (8)
Length: 20
```

```

Max_length: 0
Decimals: 0
Flags: BINARY

0 rows in set (0.00 sec)

mysql> select * from information_schema.columns where table_name='varbin'\G
***** 1. row ****
  TABLE_CATALOG: NULL
  TABLE_SCHEMA: test
  TABLE_NAME: varbin
  COLUMN_NAME: a
  ORDINAL_POSITION: 1
  COLUMN_DEFAULT: NULL
  IS_NULLABLE: YES
  DATA_TYPE: varchar
CHARACTER_MAXIMUM_LENGTH: 20
CHARACTER_OCTET_LENGTH: 60
  NUMERIC_PRECISION: NULL
  NUMERIC_SCALE: NULL
  CHARACTER_SET_NAME: utf8
  COLLATION_NAME: utf8_bin
  COLUMN_TYPE: varchar(20)
  COLUMN_KEY:
  EXTRA:
  PRIVILEGES: select,insert,update,references
  COLUMN_COMMENT:
1 row in set (0.01 sec)

```

However, `INFORMATION_SCHEMA` gives no hint in its `COLUMNS` table that metadata will contain the `BINARY` flag. `DatabaseMetaData::getColumns()` uses `INFORMATION_SCHEMA`. It will report the type name `CHAR` for the same column. Note, a different type code is also returned.

- The MySQL Connector/C++ class `sql::::DataType` defines the following JDBC standard data types: `UNKNOWN`, `BIT`, `TINYINT`, `SMALLINT`, `MEDIUMINT`, `INTEGER`, `BIGINT`, `REAL`, `DOUBLE`, `DECIMAL`, `NUMERIC`, `CHAR`, `BINARY`, `VARCHAR`, `VARBINARY`, `LONGVARCHAR`, `LONGVARBINARY`, `TIMESTAMP`, `DATE`, `TIME`, `GEOMETRY`, `ENUM`, `SET`, `SQLNULL`.

However, the following JDBC standard data types are *not* supported by MySQL Connector/C++: `ARRAY`, `BLOB`, `CLOB`, `DISTINCT`, `FLOAT`, `OTHER`, `REF`, `STRUCT`.

- When inserting or updating `BLOB` or `TEXT` columns, MySQL Connector/C++ developers are advised not to use `setString()`. Instead it is recommended that the dedicated API function `setBlob()` be used instead.

The use of `setString()` can cause a `Packet too large` error message. The error will occur if the length of the string passed to the connector using `setString()` exceeds `max_allowed_packet` (minus a few bytes reserved in the protocol for control purposes). This situation is not handled in MySQL Connector/C++, as this could lead to security issues, such as extremely large memory allocation requests due to malevolently long strings.

However, if `setBlob()` is used, this problem does not arise. This is because `setBlob()` takes a streaming approach based on `std::::istream`. When sending the data from the stream to MySQL Server, MySQL Connector/C++ will split the stream into chunks appropriate for MySQL Server and observe the `max_allowed_packet` setting currently being used.

Caution

When using `setString()` it is not possible to set `max_allowed_packet` to a value large enough for the string, prior to passing it to MySQL Connector/C++. The MySQL 5.1 documentation for `max_allowed_packet` states: “As of MySQL 5.1.31, the session value of this variable is read only. Before 5.1.31, setting the session value is permitted but has no effect.”

This difference with the JDBC specification ensures that MySQL Connector/C++ is not vulnerable to memory flooding attacks.

- In general MySQL Connector/C++ works with MySQL 5.0, but it is not completely supported. Some methods may not be available when connecting to MySQL 5.0. This is because the Information Schema is used to obtain the requested information. There are no plans to improve the support for 5.0 because the current GA version of MySQL Server is 5.1. As a new product, MySQL Connector/C++ is primarily targeted at the MySQL Server GA version that was available on its release.

The following methods will throw a `sql::::MethodNotImplemented` exception when you connect to MySQL earlier than 5.1.0:

- `DatabaseMetadata::getCrossReference()`
- `DatabaseMetadata::getExportedKeys()`
- MySQL Connector/C++ includes a method `Connection::getClientOption()` which is not included in the JDBC API specification. The prototype is:

```
void getClientOption(const std::string & optionName, void * optionValue)
```

The method can be used to check the value of connection properties set when establishing a database connection. The values are returned through the `optionValue` argument passed to the method with the type `void *`.

Currently, `getClientOption()` supports fetching the `optionValue` of the following options:

- `metadataUseInfoSchema`
- `defaultStatementResultType`
- `defaultPreparedStatementResultType`

The connection option `metadataUseInfoSchema` controls whether to use the `Information_Schemata` for returning the meta data of `SHOW` commands. In the case of `metadataUseInfoSchema` the `optionValue` argument should be interpreted as a boolean upon return.

In the case of both `defaultStatementResultType` and `defaultPreparedStatementResultType`, the `optionValue` argument should be interpreted as an integer upon return.

The connection property can be either set when establishing the connection through the connection property map or using `void Connection::setClientOption(const std::string & optionName, const void * optionValue)` where `optionName` is assigned the value `metadataUseInfoSchema`.

Some examples are given below:

```
int defaultStmtResType;
int defaultPStmtResType;
conn->getClientOption("defaultStatementResultType", (void *) &defaultStmtResType);
conn->getClientOption("defaultPreparedStatementResultType", (void *) &defaultPStmtResType);

bool isInfoSchemaUsed;
conn->getClientOption("metadataUseInfoSchema", (void *) &isInfoSchemaUsed);
```

- MySQL Connector/C++ also supports the following methods not found in the JDBC API standard:

```
std::string MySQL_Connection::getSessionVariable(const std::string & varname)
```

```
void MySQL_Connection::setSessionVariable(const std::string & varname, const std::string & value)
```

Note that both methods are members of the `MySQL_Connection` class. The methods get and set MySQL session variables.

`setSessionVariable()` is equivalent to executing:

```
SET SESSION <varname> = <value>
```

`getSessionVariable()` is equivalent to executing the following and fetching the first return value:

```
SHOW SESSION VARIABLES LIKE "<varname>"
```

You can use “%” and other placeholders in `<varname>`, if the underlying MySQL server supports this.

- Fetching the value of a column can sometimes return different values depending on whether the call is made from a Statement or Prepared Statement. This is because the protocol used to communicate with the server differs depending on whether a Statement or Prepared Statement is used.

To illustrate this, consider the case where a column has been defined as of type `BIGINT`. The most negative `BIGINT` value is then inserted into the column. If a Statement and Prepared Statement are created that perform a `GetUInt64()` call, then the results will be found to be different in each case. The Statement returns the maximum positive value for `BIGINT`. The Prepared Statement returns 0.

The reason for the different results is due to the fact that Statements use a text protocol, and Prepared Statements use a binary protocol. With the binary protocol in this case, a binary value is returned from the server that can be interpreted as an `int64`. In the above scenario a very large negative value was fetched with `GetUInt64()`, which fetches unsigned integers. As the large negative value cannot be sensibly converted to an unsigned value 0 is returned.

In the case of the Statement, which uses the text protocol, values are returned from the server as strings, and then converted as required. When a string value is returned from the server in the above scenario the large negative value will need to be converted by the runtime library function `strtoul()`, which `GetUInt64()` calls. The behavior of `strtoul()` is dependent upon the specific runtime and host operating system, so the results can be variable. In the case given a large positive value was

actually returned.

Although it is very rare, there are some cases where Statements and Prepared Statements can return different values unexpectedly, but this usually only happens in extreme cases such as the one mentioned.

- The JDBC documentation [lists many fields](#) for the `DatabaseMetaData` class. JDBC also appears to [define certain values](#) for those fields. However, MySQL Connector/C++ does not define certain values for those fields. Internally enumerations are used and the compiler determines the values to assign to a field.

To compare a value with the field, code such as the following should be used, rather than making assumptions about specific values for the attribute:

```
// dbmeta is an instance of DatabaseMetaData
if (myvalue == dbmeta->attributeNoNulls) {
    ...
}
```

Usually `myvalue` will be a column from a result set holding metadata information. MySQL Connector/C++ does not guarantee that `attributeNoNulls` is 0. It can be any value.

- When programming Stored Procedures JDBC has available an extra class, an extra abstraction layer for callable statements, the `CallableStatement` class. This is not present in MySQL Connector/C++. You therefore need to use the methods from the `Statement` and `Prepared Statement` classes to run a Stored Procedure using `CALL`.

22.5.9. MySQL Connector/C++ Known Bugs and Issues

Note

Please report bugs through [MySQL Bug System](#).

Known bugs:

None.

Known issues:

- When linking against a static library for 1.0.3 on Windows you need to define `CPPDBC_PUBLIC_FUNC` either in the compiler options (preferable) or with `/D "CPPCONN_PUBLIC_FUNC=`". You can also explicitly define it in your code by placing `#define CPPCONN_PUBLIC_FUNC` before the header inclusions.
- Generally speaking C++ library binaries are less portable than C library binaries. Issues can be caused by name mangling, different Standard Template Library (STL) versions and using different compilers and linkers for linking against the libraries than were used for building the library itself.

Even a small change in the compiler version can, but does not have to, cause problems. If you obtain error messages, that you suspect are related to binary incompatibilities, build MySQL Connector/C++ from source, using the same compiler and linker that you will use to build and link your application.

Due to the variations between Linux distributions, compiler and linker versions and STL versions, it is not possible to provide binaries for each and every possible configuration. However, the MySQL Connector/C++ binary distributions contain a `README` file that describes the environment and settings used to build the binary versions of the libraries.

- To avoid potential crashes the build configuration of MySQL Connector/C++ should match the build configuration of the application using it. For example, do not use the release build of MySQL Connector/C++ with a debug build of the client application.

See also the MySQL Connector/C++ Changelogs which can be found here [Section D.8, “MySQL Connector/C++ Change History”](#).

22.5.10. MySQL Connector/C++ Feature requests

You can suggest new features in the first instance by joining the mailing list or forum and talking with the developers directly. See [Section 22.5.11, “MySQL Connector/C++ Support”](#)

The following feature requests are currently being worked on:

- C++ references for `Statements`, `ResultSets`, and exceptions, are being considered, instead of pointers to heap memory.

This reduces the exception handling burden for the programmer.

- Adopt STL (suggestions are welcome).
- JDBC compliance: data type interfaces and support through `ResultSet::getType()` and `PreparedStatement::bind()`. Introduce `sql::Blob`, `sql::Clob`, `sql::Date`, `sql::Time`, `sql::Timestamp`, `sql::URL`. Support `get|setBlob()`, `get|setClob()`, `get|setDate()`, `get|setTime()`, `get|setTimestamp()`, `get|setURL()`
- Add support for all C-API connection options. Improved support for `mysql_options`.
- Add connect method which supports passing options using HashMaps.
- Create Windows installer.

22.5.11. MySQL Connector/C++ Support

For general discussion of the MySQL Connector/C++ please use the [C/C++ community forum](#) or join the [MySQL Connector/C++ mailing list](#).

Bugs can be reported at the [MySQL bug Web site](#).

For Licensing questions, and to purchase MySQL Products and Services, please <http://www.mysql.com/buy-mysql/>

The MySQL Connector/C++ Changelogs can be found here [Section D.8, “MySQL Connector/C++ Change History”](#)

22.5.12. MySQL Connector/C++ FAQ

Questions

- [23.5.12.1: What is MySQL Connector/C++?](#)
- [23.5.12.2: Are any MySQL products using MySQL Connector/C++?](#)
- [23.5.12.3: Does MySQL Connector/C++ implement the client/server protocol?](#)
- [23.5.12.4: Which MySQL Server version\(s\) is MySQL Connector/C++ compatible with?](#)

Questions and Answers

23.5.12.1: What is MySQL Connector/C++?

MySQL Connector/C++ is a MySQL database connector for C++. It allows you develop applications in C++ that connect to the MySQL Server. MySQL Connector/C++ is compatible with the JDBC 4.0 API.

23.5.12.2: Are any MySQL products using MySQL Connector/C++?

Yes, MySQL Workbench and MySQL Connector/OpenOffice.org.

23.5.12.3: Does MySQL Connector/C++ implement the client/server protocol?

No. MySQL Connector/C++ uses the MySQL Client Library for the client/server communication.

23.5.12.4: Which MySQL Server version(s) is MySQL Connector/C++ compatible with?

MySQL Connector/C++ fully supports MySQL Server version 5.1 and later.

22.6. MySQL Connector/C

What is MySQL Connector/C?

MySQL Connector/C is a C client library for client/server communication. It is a standalone replacement for the MySQL Client Library shipped with the MySQL Server.

Why have a replacement for MySQL Client Library?

There is no need to compile or install the MySQL Server package if you only need the client library.

MySQL Connector/C does not rely on the MySQL Server release cycle, so bug fixes and new features are released more often.

MySQL Connector/C API documentation is available here [Section 22.9.3, “C API Function Descriptions”](#).

Supported platforms include:

- Windows
- Windows x64
- Linux
- Solaris
- FreeBSD
- Mac OS X
- HP-UX
- IBM AIX
- IBM i5/OS

22.6.1. Building MySQL Connector/C from the Source Code

Obtaining the Source Code

A TAR file containing the source code can be [downloaded](#) from the MySQL Developers site. You will need to select the source code package from the drop down list.

The source code for development releases of the connector can be found at Launchpad. The project home page can be found [here](#).

The source code for the 1.0 branch can be found [here](#).

To obtain the code you will need to have Bazaar installed and use the command `bzr branch lp:libmysql`.

• Building on Unix

Examples of supported Unix or Unix-like operating systems include:

- Solaris
- Linux
- HP-UX
- AIX
- OS X

Compiler Tools

Ideally, the native compiler tool set for the target platform is used for compilation. This would be SunStudio for Solaris and aCC for HP-UX for example. However, the GNU tool-chain can be used across all platforms.

You also need [CMake](#) 2.6 or newer, which is available [online](#).

To Build

If using GNU AutoTools change to the MySQL Connector/C source directory and follow the procedure below.

1. To generate the makefile enter:

```
shell> cmake -G "Unix Makefiles"
```

or for a Debug build enter:

```
shell> cmake -G "Unix Makefiles" -DCMAKE_BUILD_TYPE=Debug
```

2. Then build the project using:

```
shell> make
```

To Install

By default make install will install the MySQL Connector/C files in the `/usr/local` directory. You can change this behavior by specifying another directory when generating the `makefile`:

```
shell> cmake -G "Unix Makefiles" -DCMAKE_INSTALL_PREFIX=/mypath
```

Now, in the root shell, enter the following to install the MySQL Connector/C libraries and tools:

```
root-shell> make install
```

At this point all of the MySQL Connector/C files will be in place.

- **Building on Microsoft Windows**

Older versions of Microsoft Windows are not supported. Supported versions are Windows 2000, Windows XP, Windows Vista, Windows Server 2003, or Windows Server 2008.

Compiler Tools

Microsoft Visual Studio 8 and 9 are recommended. The Express Edition of Visual Studio and other compilers may work, but are untested.

You also need `CMake` 2.6 or newer, available at <http://www.cmake.org>

To Build

You need to have the environment variables set for the Visual Studio toolchain. Visual Studio includes a batch file to set these for you, and installs a shortcut into the **START** menu to open a command prompt with these variables set.

Build MySQL Connector/C using the `CMake` command-line tool by entering the following from the source root directory in a command prompt window:

```
shell> cmake -G "Visual Studio 9 2008"
```

This produces a project file that you can open with Visual Studio or build from the command line with either of:

```
shell> devenv.com libmysql.sln /build Release
```

```
shell> devenv.com libmysql.sln /build RelWithDebInfo
```

For other versions of Visual Studio or `nmake` based build, run the following command:

```
shell> cmake --help
```

to check the supported generators.

To compile the Debug build, you must run set the `CMake` build type so the correct version of external libraries are used:

```
shell> cmake -G "Visual Studio 8 2005" -DCMAKE_BUILD_TYPE=Debug
```

Followed by:

```
shell> devenv.com libmysql.sln /build Debug
```

To Install

To create a install package you can choose between two variants:

1. Creating a Zip package
2. Creating an MSI install package

- **Zip package**

To create a Zip package, run the `cpack` command from the root of your MySQL Connector/C source directory.

- **MSI Install package**

The required tools include Windows XML Installer toolset (WIX), which is available [online](#).

To create the MSI install package change to the subdirectory `win` and generate the `makefile`:

```
shell> cmake -G "NMake Makefiles"
```

Create the MSI install package by calling `nmake`:

```
shell> nmake
```

Build Options

The following options can be used when building the MySQL Connector/C source code:

Build Option	Description
<code>-DWITH_OPENSSL=1</code>	Enables dynamic linking to the system OpenSSL library.
<code>-DWITH_EXTERNAL_ZLIB=1</code>	Enables dynamic linking to the system Zlib library.

22.6.2. Testing MySQL Connector/C

For testing MySQL Connector/C you will need a running MySQL server instance. Before you run the test suite you need to specify the following environment variables:

- `MYSQL_TEST_HOST` (default localhost)
- `MYSQL_TEST_USER`
- `MYSQL_TEST_PASSWD`
- `MYSQL_TEST_PORT`
- `MYSQL_TEST_SOCKET`
- `MYSQL_TEST_DB` (default test)

To run the test suite, execute `ctest` from the command line:

```
shell> ctest
```

22.6.3. MySQL Connector/C FAQ

Questions

- [23.6.3.1:](#) What is the “MySQL Native C API”? What are its typical benefits and use cases?
- [23.6.3.2:](#) What is “libmysql”?
- [23.6.3.3:](#) What is “libmysqld”?
- [23.6.3.4:](#) What is “MySQL Connector/C”?
- [23.6.3.5:](#) What is the difference between “Native C API”, “libmysql”, “libmysqld” and “MySQL Connector/C”?
- [23.6.3.6:](#) Does MySQL Connector/C replace any of “Native C API”, “libmysql” and “libmysqld”?

Questions and Answers

23.6.3.1: What is the “MySQL Native C API”? What are its typical benefits and use cases?

MySQL Connector/C, also known as `libmysql`, or MySQL Native C API, is a standalone, C-based API and library that you can use in C applications to connect with the MySQL Server. It implements the same MySQL client API that has been in use for a decade.

It is also used as the foundation for drivers for standard database APIs such as ODBC, Perl's DBI, and Python's DB API.

23.6.3.2: What is “libmysql”?

`libmysql` is the name of the library that MySQL Connector/C provides.

23.6.3.3: What is “libmysqld”?

`libmysqld` is an embedded database server with the same API as MySQL Connector/C. It is included with the MySQL Server distribution.

23.6.3.4: What is “MySQL Connector/C”?

MySQL Connector/C is a standalone distribution of the `libmysql` library, which was previously only available as part of the MySQL Server distribution. The version of `libmysql` included with MySQL Connector/C and the version bundled with the server are functionally equivalent, but the cross-platform build system for MySQL Connector/C uses `CMake`.

23.6.3.5: What is the difference between “Native C API”, “libmysql”, “libmysqld” and “MySQL Connector/C”?

MySQL Connector/C and `libmysql` are the “native C API for MySQL”, and all three terms can be used interchangeably. “`libmysqld`” is the embedded version of the MySQL Server, and is included in the server distribution.

23.6.3.6: Does MySQL Connector/C replace any of “Native C API”, “libmysql” and “libmysqld”?

MySQL Connector/C contains `libmysql`, and implements a native C API. It does not include `libmysqld`, which can be found with the MySQL server distribution.

22.7. MySQL Connector/OpenOffice.org

MySQL Connector/OpenOffice.org is a native MySQL database connector for OpenOffice.org. Currently, it is in preview status and supports OpenOffice.org 3.1 and above. It can be used to connect OpenOffice.org applications to a MySQL server.

Before MySQL Connector/OpenOffice.org became available you would have to use MySQL Connector/J (JDBC) or MySQL Connector/ODBC to connect to a MySQL server.

Connector/OpenOffice.org is a community project. The source code for Connector/OpenOffice.org is available under GPL with the FLOSS License Exception.

Advantages

Using MySQL Connector/OpenOffice.org has the following advantages:

- Easy installation through the OpenOffice.org Extension Manager.
- Seamless integration into OpenOffice.org.
- No need to go through an additional Connector installation routine (ODBC/JDBC)
- No need to configure or register an additional Connector (ODBC)
- No need to install or configure a driver manager (ODBC)

Status

MySQL Connector/OpenOffice.org is currently at version 1.0 GA.

If you have any queries please contact us through our mailing list at <users@dba.openoffice.org>

22.7.1. Installation

1. Install or upgrade to OpenOffice.org 3.1.
2. Download MySQL Connector/OpenOffice.org from [The OpenOffice.org extension download site](#). Save the file corresponding to your platform. Currently supported platforms are Windows, Linux, Linux x86-64, Mac OS X, Solaris x86 and Solaris SPARC.
3. Add the `.oxt` extension through the Extension Manager of OpenOffice.org. In OpenOffice.org, select **TOOLS, EXTENSION MANAGER...** and specify the `.oxt` file as a new extension. When done, MySQL Connector/OpenOffice.org will show up as a new extension in the Extension Manager.

Figure 22.81. Adding an Extension

4. Restart OpenOffice.org.

22.7.2. Getting Started: Connecting to MySQL

MySQL Connector/OpenOffice.org enables you to access the MySQL Server and its schemata from the OpenOffice.org suite.

The following example demonstrates the creation of a new OpenOffice.org Base database which uses a local MySQL Server for storage and the new connector for connecting.

1. **Select the database**

Create a new database by selecting **FILE, NEW, DATABASE**. This starts a wizard that enables you to create a new database, open an existing database, or connect to an existing database. Select the **CONNECT TO EXISTING DATABASE** radio button. From the listbox select MySQL. Click **NEXT >>**.

Figure 22.82. Selecting the Database

2. You will be asked how you would like to connect to the database. Select the **CONNECT NATIVE** radio button.

Figure 22.83. Selecting the connection type

Click NEXT >>.

3. **Fill in the connection settings**

Enter the name of the database, server URL, and optionally the socket to connect on (if not using the default).

Note that if you do not specify a database all databases will be available for selection.

Figure 22.84. Entering Connection Settings

Click NEXT >>.

4. **Set up user authentication**

If you are using MySQL server's anonymous account without a password, you do not have to fill in anything in this step. Otherwise, fill in your MySQL user name and check the password checkbox. Note, for security reasons, you should not normally use the anonymous account without a password.

Figure 22.85. Setting Up User Authentication

You can now test your connection to the MySQL database server by clicking the TEST CONNECTION button. Check the checkbox if you do not want OpenOffice.org to ask you for your password again in the current session. Testing the connection is optional, although recommended.

Click NEXT >>.

5. Decide how to proceed after connecting to the database

Figure 22.86. After Connecting to the Database

Keep the default settings.

Click FINISH.

6. You will then be prompted to save your database as a database file. Enter the name of the database and the location in which to save the file.

Figure 22.87. Entering the Database File Name

Click SAVE.

You will be located in the Base application with your database tables displayed.

22.7.3. Getting Started: Usage Examples

Listing Tables

In the **DATABASE** area of the **BASE** main window, select **TABLES**. If this is the first time you are accessing the database you will be prompted for your credentials (user name and password); you can store these settings for your current Base session.

Figure 22.88. Listing Tables

Depending on your connection settings you will now see all databases with all their tables, or just the database you have specified in the connection settings.

22.7.4. References

See the [OpenOffice.org Web site](#) for documentation of the office suite and its Extension Manager.

22.7.5. Known Bugs

If you discover a bug in Connector/OpenOffice.org please [add it to this list](#) and send an email to <users@dba.openoffice.org>. You need to be logged in with an OpenOffice.org account for both; see the [project mailing list](#) for details.

22.7.6. Contact

To discuss the new MySQL Connector/OpenOffice.org, please subscribe to the mailing list <users@dba.openoffice.org>. It is a low-volume list with less than 10 mails per day.

22.8. libmysqld, the Embedded MySQL Server Library

The embedded MySQL server library makes it possible to run a full-featured MySQL server inside a client application. The main benefits are increased speed and more simple management for embedded applications.

The embedded server library is based on the client/server version of MySQL, which is written in C/C++. Consequently, the embedded server also is written in C/C++. There is no embedded server available in other languages.

The API is identical for the embedded MySQL version and the client/server version. To change an old threaded application to use the embedded library, you normally only have to add calls to the following functions.

Function	When to Call
<code>mysql_library_init()</code>	Should be called before any other MySQL function is called, preferably early in the <code>main()</code> function.
<code>mysql_library_end()</code>	Should be called before your program exits.
<code>mysql_thread_init()</code>	Should be called in each thread you create that accesses MySQL.
<code>mysql_thread_end()</code>	Should be called before calling <code>pthread_exit()</code>

Then you must link your code with `libmysqld.a` instead of `libmysqlclient.a`. To ensure binary compatibility between your application and the server library, be sure to compile your application against headers for the same series of MySQL that was used to compile the server library. For example, if `libmysqld` was compiled against MySQL 4.1 headers, do not compile your application against MySQL 5.1 headers, or vice versa.

The `mysql_library_xxx()` functions are also included in `libmysqlclient.a` to enable you to change between the embedded and the client/server version by just linking your application with the right library. See [Section 22.9.3.40, “`mysql_library_init\(\)`”](#).

One difference between the embedded server and the standalone server is that for the embedded server, authentication for connections is disabled by default. To use authentication for the embedded server, define the `HAVE_EMBEDDED_PRIVILEGE_CONTROL` compiler flag when you invoke `CMake` to configure your MySQL distribution. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

22.8.1. Compiling Programs with `libmysqld`

In precompiled binary MySQL distributions that include `libmysqld`, the embedded server library, MySQL builds the library using the appropriate vendor compiler if there is one.

To get a `libmysqld` library if you build MySQL from source yourself, you should configure MySQL with the `-DWITH_EMBEDDED_SERVER=1` option. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

When you link your program with `libmysqld`, you must also include the system-specific `pthread` libraries and some libraries that the MySQL server uses. You can get the full list of libraries by executing `mysql_config --libmysqld-libs`.

The correct flags for compiling and linking a threaded program must be used, even if you do not directly call any thread functions in your code.

To compile a C program to include the necessary files to embed the MySQL server library into an executable version of a program, the compiler will need to know where to find various files and need instructions on how to compile the program. The following example shows how a program could be compiled from the command line, assuming that you are using `gcc`, use the GNU C compiler:

```
gcc mysql_test.c -o mysql_test -lz \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

Immediately following the `gcc` command is the name of the C program source file. After it, the `-o` option is given to indicate that the file name that follows is the name that the compiler is to give to the output file, the compiled program. The next line of code tells the compiler to obtain the location of the include files and libraries and other settings for the system on which it is compiled. Because of a problem with `mysql_config`, the option `-lz` (for compression) is added here. The `mysql_config` command is contained in backticks, not single quotation marks.

On some non-`gcc` platforms, the embedded library depends on C++ runtime libraries and linking against the embedded library might result in missing-symbol errors. To solve this, link using a C++ compiler or explicitly list the required libraries on the link command line.

22.8.2. Restrictions When Using the Embedded MySQL Server

The embedded server has the following limitations:

- No user-defined functions (UDFs).
- No stack trace on core dump.
- You cannot set this up as a master or a slave (no replication).
- Very large result sets may be unusable on low memory systems.

- You cannot connect to an embedded server from an outside process with sockets or TCP/IP. However, you can connect to an intermediate application, which in turn can connect to an embedded server on the behalf of a remote client or outside process.
- [InnoDB](#) is not reentrant in the embedded server and cannot be used for multiple connections, either successively or simultaneously.
- The Event Scheduler is not available. Because of this, the `event_scheduler` system variable is disabled.

Some of these limitations can be changed by editing the `mysql_embed.h` include file and recompiling MySQL.

22.8.3. Options with the Embedded Server

Any options that may be given with the `mysqld` server daemon, may be used with an embedded server library. Server options may be given in an array as an argument to the `mysql_library_init()`, which initializes the server. They also may be given in an option file like `my.cnf`. To specify an option file for a C program, use the `--defaults-file` option as one of the elements of the second argument of the `mysql_library_init()` function. See [Section 22.9.3.40, “mysql_library_init\(\)”](#), for more information on the `mysql_library_init()` function.

Using option files can make it easier to switch between a client/server application and one where MySQL is embedded. Put common options under the `[server]` group. These are read by both MySQL versions. Client/server-specific options should go under the `[mysqld]` section. Put options specific to the embedded MySQL server library in the `[embedded]` section. Options specific to applications go under section labeled `[ApplicationName_SERVER]`. See [Section 4.2.3.3, “Using Option Files”](#).

22.8.4. Embedded Server Examples

These two example programs should work without any changes on a Linux or FreeBSD system. For other operating systems, minor changes are needed, mostly with file paths. These examples are designed to give enough details for you to understand the problem, without the clutter that is a necessary part of a real application. The first example is very straightforward. The second example is a little more advanced with some error checking. The first is followed by a command-line entry for compiling the program. The second is followed by a GNUmakefile that may be used for compiling instead.

Example 1

```
test1_libmysqld.c

#include <stdio.h>
#include <stdlib.h>
#include <stdarg.h>
#include "mysql.h"

MYSQL *mysql;
MYSQL_RES *results;
MYSQL_ROW record;

static char *server_options[] = \
{ "mysql_test", "--defaults-file=my.cnf", NULL };
int num_elements = (sizeof(server_options) / sizeof(char *)) - 1;

static char *server_groups[] = { "libmysqld_server",
                                "libmysqld_client", NULL };

int main(void)
{
    mysql_library_init(num_elements, server_options, server_groups);
    mysql = mysql_init(NULL);
    mysql_options(mysql, MYSQL_READ_DEFAULT_GROUP, "libmysqld_client");
    mysql_options(mysql, MYSQL_OPT_USE_EMBEDDED_CONNECTION, NULL);

    mysql_real_connect(mysql, NULL,NULL,NULL, "database1", 0,NULL,0);
    mysql_query(mysql, "SELECT column1, column2 FROM table1");
    results = mysql_store_result(mysql);

    while((record = mysql_fetch_row(results))) {
        printf("%s - %s \n", record[0], record[1]);
    }

    mysql_free_result(results);
    mysql_close(mysql);
    mysql_library_end();

    return 0;
}
```

Here is the command line for compiling the above program:

```
gcc test1_libmysqld.c -o test1_libmysqld -lz \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

Example 2

To try the example, create an `test2_libmysqld` directory at the same level as the MySQL source directory. Save the `test2_libmysqld.c` source and the `GNUmakefile` in the directory, and run GNU `make` from inside the `test2_libmysqld` directory.

```
test2_libmysqld.c

/*
 * A simple example client, using the embedded MySQL server library
 */

#include <mysql.h>
#include <stdarg.h>
#include <stdio.h>
#include <stdlib.h>

MYSQL *db_connect(const char *dbname);
void db_disconnect(MYSQL *db);
void db_do_query(MYSQL *db, const char *query);

const char *server_groups[] = {
    "test2_libmysqld_SERVER", "embedded", "server", NULL
};

int
main(int argc, char **argv)
{
    MYSQL *one, *two;

    /* mysql_library_init() must be called before any other mysql
     * functions.
     *
     * You can use mysql_library_init(0, NULL, NULL), and it
     * initializes the server using groups = {
     *     "server", "embedded", NULL
     * }.
     *
     * In your $HOME/.my.cnf file, you probably want to put:

[mysql]
language = /path/to/source/of/mysql/sql/share/english

    * You could, of course, modify argc and argv before passing
    * them to this function. Or you could create new ones in any
    * way you like. But all of the arguments in argv (except for
    * argv[0], which is the program name) should be valid options
    * for the MySQL server.
    *
    * If you link this client against the normal mysqlclient
    * library, this function is just a stub that does nothing.
    */
    mysql_library_init(argc, argv, (char **)server_groups);

    one = db_connect("test");
    two = db_connect(NULL);

    db_do_query(one, "SHOW TABLE STATUS");
    db_do_query(two, "SHOW DATABASES");

    mysql_close(two);
    mysql_close(one);

    /* This must be called after all other mysql functions */
    mysql_library_end();

    exit(EXIT_SUCCESS);
}

static void
die(MYSQL *db, char *fmt, ...)
{
    va_list ap;
    va_start(ap, fmt);
    vfprintf(stderr, fmt, ap);
    va_end(ap);
    (void)putc('\n', stderr);
    if (db)
        db_disconnect(db);
    exit(EXIT_FAILURE);
}

MYSQL *
db_connect(const char *dbname)
{
    MYSQL *db = mysql_init(NULL);
    if (!db)
        die(db, "mysql_init failed: no memory");
    /*
     * Notice that the client and server use separate group names.
     * This is critical, because the server does not accept the
     * client's options, and vice versa.
    */
}
```

```

/*
mysql_options(db, MYSQL_READ_DEFAULT_GROUP, "test2_libmysqld_CLIENT");
if (!mysql_real_connect(db, NULL, NULL, NULL, dbname, 0, NULL, 0))
    die(db, "mysql_real_connect failed: %s", mysql_error(db));

return db;
}

void
db_disconnect(MYSQL *db)
{
    mysql_close(db);
}

void
db_do_query(MYSQL *db, const char *query)
{
    if (mysql_query(db, query) != 0)
        goto err;

    if (mysql_field_count(db) > 0)
    {
        MYSQL_RES     *res;
        MYSQL_ROW      row, end_row;
        int num_fields;

        if (!(res = mysql_store_result(db)))
            goto err;
        num_fields = mysql_num_fields(res);
        while ((row = mysql_fetch_row(res)))
        {
            (void)fputs("">> ", stdout);
            for (end_row = row + num_fields; row < end_row; ++row)
                (void)printf("%s\t", row ? (char*)*row : "NULL");
            (void)fputc('\n', stdout);
        }
        (void)fputc('\n', stdout);
        mysql_free_result(res);
    }
    else
        (void)printf("Affected rows: %lld\n", mysql_affected_rows(db));
    return;
err:
    die(db, "db_do_query failed: %s [%s]", mysql_error(db), query);
}

```

GNUmakefile

```

# This assumes the MySQL software is installed in /usr/local/mysql
inc      := /usr/local/mysql/include/mysql
lib      := /usr/local/mysql/lib

# If you have not installed the MySQL software yet, try this instead
#inc      := $(HOME)/mysql-5.5/include
#lib      := $(HOME)/mysql-5.5/libmysqld

CC       := gcc

else
# Assume Linux
LDLIBS += -lpthread
endif

# This works for simple one-file test programs
sources := $(wildcard *.c)
objects := $(patsubst %.c,%o,$(sources))
targets := $(basename $(sources))

all: $(targets)

clean:
    rm -f $(targets) $(objects) *.core

```

22.8.5. Licensing the Embedded Server

We encourage everyone to promote free software by releasing code under the GPL or a compatible license. For those who are not able to do this, another option is to purchase a commercial license for the MySQL code from Oracle Corporation. For details, please see <http://www.mysql.com/company/legal/licensing/>.

22.9. MySQL C API

The C API code is distributed with MySQL. It is included in the `mysqlclient` library and enables C programs to access a database.

Many of the clients in the MySQL source distribution are written in C. If you are looking for examples that demonstrate how to use the C API, take a look at these clients. You can find these in the `client` directory in the MySQL source distribution.

Most of the other client APIs (all except Connector/J and Connector/NET) use the `mysqlclient` library to communicate with the MySQL server. This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs, because they are referenced from the library. See [Chapter 4, MySQL Programs](#), for a list of these variables.

The client has a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (the maximum is 16MB). Because buffer sizes are increased only as demand warrants, simply increasing the default maximum limit does not in itself cause more resources to be used. This size check is mostly a check for erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each thread's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have `BLOB` values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The client's default maximum is 16MB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter when the server is started. See [Section 7.11.2, “Tuning Server Parameters”](#).

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

For programming with threads, see [Section 22.9.17.2, “How to Write a Threaded Client”](#). For creating a standalone application which includes the “server” and “client” in the same program (and does not communicate with an external MySQL server), see [Section 22.8, “libmysqld, the Embedded MySQL Server Library”](#).

Note

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, you probably have used old header or library files when compiling your programs. In this case, you should check the date for your `mysql.h` file and `libmysqlclient.a` library to verify that they are from the new MySQL distribution. If not, recompile your programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example from `libmysqlclient.so.15` to `libmysqlclient.so.16`).

22.9.1. C API Data Structures

This section describes C API data structures other than those used for prepared statements. For information about the latter, see [Section 22.9.5, “C API Prepared Statement Data Structures”](#).

- [`MYSQL`](#)

This structure represents a handle to one database connection. It is used for almost all MySQL functions. You should not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- [`MYSQL_RES`](#)

This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- [`MYSQL_ROW`](#)

This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- [`MYSQL_FIELD`](#)

This structure contains information about a field, such as the field's name, type, and size. Its members are described in more detail later in this section. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- [`MYSQL_FIELD_OFFSET`](#)

This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field numbers within a row, beginning at zero.

- **`my_ulonglong`**

The type used for the number of rows and for `mysql_affected_rows()`, `mysql_num_rows()`, and `mysql_insert_id()`. This type provides a range of 0 to `1.84e19`.

On some systems, attempting to print a value of type `my_ulonglong` does not work. To print such a value, convert it to `unsigned long` and use a `%lu` print format. Example:

```
printf ("Number of rows: %lu\n",
       (unsigned long) mysql_num_rows(result));
```

- **`my_bool`**

A boolean type, for values that are true (nonzero) or false (zero).

The `MYSQL_FIELD` structure contains the members described in the following list. The definitions apply primarily for columns of result sets such as those produced by `SELECT` statements. As of MySQL 5.5.3, `MYSQL_FIELD` structures are also used to provide metadata for `OUT` and `INOUT` parameters returned from stored procedures executed using prepared `CALL` statements. For such parameters, some of the structure members have a meaning different from the meaning for column values.

- **`char * name`**

The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias. For a procedure parameter, the parameter name.

- **`char * org_name`**

The name of the field, as a null-terminated string. Aliases are ignored. For a procedure parameter, the parameter name.

- **`char * table`**

The name of the table containing this field, if it isn't a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string. For a procedure parameter, the procedure name.

- **`char * org_table`**

The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the underlying table. For a `UNION`, the value is the empty string. For a procedure parameter, the procedure name.

- **`char * db`**

The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the name of the database containing the procedure.

- **`char * catalog`**

The catalog name. This value is always `"def"`.

- **`char * def`**

The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- **`unsigned long length`**

The width of the field. This corresponds to the display length, in bytes.

The server determines the `length` value before it generates the result set, so this is the minimum length required for a data type capable of holding the largest possible value from the result column, without knowing in advance the actual values that will be produced by the query for the result set.

- **`unsigned long max_length`**

The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the res-

ult set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.

The value of `max_length` is the length of the string representation of the values in the result set. For example, if you retrieve a `FLOAT` column and the “widest” value is `-12.345`, `max_length` is 7 (the length of ‘`-12.345`’).

If you are using prepared statements, `max_length` is not set by default because for the binary protocol the lengths of the values depend on the types of the values in the result set. (See [Section 22.9.5, “C API Prepared Statement Data Structures”](#).) If you want the `max_length` values anyway, enable the `STMT_ATTR_UPDATE_MAX_LENGTH` option with `mysql_stmt_attr_set()` and the lengths will be set when you call `mysql_stmt_store_result()`. (See [Section 22.9.7.3, “mysql_stmt_attr_set\(\)”](#), and [Section 22.9.7.28, “mysql_stmt_store_result\(\)”](#).)

- `unsigned int name_length`

The length of `name`.

- `unsigned int org_name_length`

The length of `org_name`.

- `unsigned int table_length`

The length of `table`.

- `unsigned int org_table_length`

The length of `org_table`.

- `unsigned int db_length`

The length of `db`.

- `unsigned int catalog_length`

The length of `catalog`.

- `unsigned int def_length`

The length of `def`.

- `unsigned int flags`

Bit-flags that describe the field. The `flags` value may have zero or more of the following bits set.

Flag Value	Flag Description
<code>NOT_NULL_FLAG</code>	Field can't be <code>NULL</code>
<code>PRI_KEY_FLAG</code>	Field is part of a primary key
<code>UNIQUE_KEY_FLAG</code>	Field is part of a unique key
<code>MULTIPLE_KEY_FLAG</code>	Field is part of a nonunique key
<code>UNSIGNED_FLAG</code>	Field has the <code>UNSIGNED</code> attribute
<code>ZEROFILL_FLAG</code>	Field has the <code>ZEROFILL</code> attribute
<code>BINARY_FLAG</code>	Field has the <code>BINARY</code> attribute
<code>AUTO_INCREMENT_FLAG</code>	Field has the <code>AUTO_INCREMENT</code> attribute
<code>NUM_FLAG</code>	Field is numeric
<code>ENUM_FLAG</code>	Field is an <code>ENUM</code> (deprecated)
<code>SET_FLAG</code>	Field is a <code>SET</code> (deprecated)
<code>BLOB_FLAG</code>	Field is a <code>BLOB</code> or <code>TEXT</code> (deprecated)
<code>TIMESTAMP_FLAG</code>	Field is a <code>TIMESTAMP</code> (deprecated)
<code>NO_DEFAULT_VALUE_FLAG</code>	Field has no default value; see additional notes following table

Use of the `BLOB_FLAG`, `ENUM_FLAG`, `SET_FLAG`, and `TIMESTAMP_FLAG` flags is deprecated because they indicate the type of a field rather than an attribute of its type. It is preferable to test `field->type` against `MYSQL_TYPE_BLOB`,

`MYSQL_TYPE_ENUM`, `MYSQL_TYPE_SET`, or `MYSQL_TYPE_TIMESTAMP` instead.

`NUM_FLAG` indicates that a column is numeric. This includes columns with a type of `MYSQL_TYPE_DECIMAL`, `MYSQL_TYPE_NEWDECIMAL`, `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, `MYSQL_TYPE_FLOAT`, `MYSQL_TYPE_DOUBLE`, `MYSQL_TYPE_NULL`, `MYSQL_TYPE_LONGLONG`, `MYSQL_TYPE_INT24`, and `MYSQL_TYPE_YEAR`.

`NO_DEFAULT_VALUE_FLAG` indicates that a column has no `DEFAULT` clause in its definition. This does not apply to `NULL` columns (because such columns have a default of `NULL`), or to `AUTO_INCREMENT` columns (which have an implied default value).

The following example illustrates a typical use of the `flags` value:

```
if (field->flags & NOT_NULL_FLAG)
    printf("Field can't be null\n");
```

You may use the following convenience macros to determine the boolean status of the `flags` value.

Flag Status	Description
<code>IS_NOT_NULL(flags)</code>	True if this field is defined as <code>NOT NULL</code>
<code>IS_PRI_KEY(flags)</code>	True if this field is a primary key
<code>IS_BLOB(flags)</code>	True if this field is a <code>BLOB</code> or <code>TEXT</code> (deprecated; test <code>field->type</code> instead)

- `unsigned int decimals`

The number of decimals for numeric fields.

- `unsigned int charsetnr`

An ID number that indicates the character set/collation pair for the field.

To distinguish between binary and nonbinary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

`charsetnr` values are the same as those displayed in the `Id` column of the `SHOW COLLATION` statement or the `ID` column of the `INFORMATION_SCHEMA COLLATIONS` table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

```
mysql> SHOW COLLATION WHERE Id = 63;
+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+
| binary    | binary   | 63 | Yes     | Yes      | 1        |
+-----+-----+-----+-----+-----+
mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
-> FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
+-----+-----+
| COLLATION_NAME | CHARACTER_SET_NAME |
+-----+-----+
| utf8_general_ci | utf8               |
+-----+-----+
```

- `enum enum_field_types type`

The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

Type Value	Type Description
<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code> field
<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code> field
<code>MYSQL_TYPE_LONG</code>	<code>INTEGER</code> field
<code>MYSQL_TYPE_INT24</code>	<code>MEDIUMINT</code> field
<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code> field
<code>MYSQL_TYPE_DECIMAL</code>	<code>DECIMAL</code> or <code>NUMERIC</code> field
<code>MYSQL_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code>

Type Value	Type Description
MYSQL_TYPE_FLOAT	FLOAT field
MYSQL_TYPE_DOUBLE	DOUBLE or REAL field
MYSQL_TYPE_BIT	BIT field
MYSQL_TYPE_TIMESTAMP	TIMESTAMP field
MYSQL_TYPE_DATE	DATE field
MYSQL_TYPE_TIME	TIME field
MYSQL_TYPE_DATETIME	DATETIME field
MYSQL_TYPE_YEAR	YEAR field
MYSQL_TYPE_STRING	CHAR or BINARY field
MYSQL_TYPE_VAR_STRING	VARCHAR or VARBINARY field
MYSQL_TYPE_BLOB	BLOB or TEXT field (use <code>max_length</code> to determine the maximum length)
MYSQL_TYPE_SET	SET field
MYSQL_TYPE_ENUM	ENUM field
MYSQL_TYPE_GEOMETRY	Spatial field
MYSQL_TYPE_NULL	NULL-type field

You can use the `IS_NUM()` macro to test whether a field has a numeric type. Pass the `type` value to `IS_NUM()` and it evaluates to TRUE if the field is numeric:

```
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

22.9.2. C API Function Overview

The functions available in the C API are summarized here and described in greater detail in a later section. See [Section 22.9.3, “C API Function Descriptions”](#).

Table 22.4. C API Function Names and Descriptions

Function	Description
<code>my_init()</code>	Initialize global variables, and thread handler in thread-safe programs
<code>mysql_affected_rows()</code>	Returns the number of rows changed/deleted/inserted by the last <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> query
<code>mysql_autocommit()</code>	Toggles autocommit mode on/off
<code>mysql_change_user()</code>	Changes user and database on an open connection
<code>mysql_character_set_name()</code>	Return default character set name for current connection
<code>mysql_client_find_plugin()</code>	Return pointer to plugin
<code>mysql_client_register_plugin()</code>	Register a plugin
<code>mysql_close()</code>	Closes a server connection
<code>mysql_commit()</code>	Commits the transaction
<code>mysql_connect()</code>	Connects to a MySQL server (this function is deprecated; use <code>mysql_real_connect()</code> instead)
<code>mysql_create_db()</code>	Creates a database (this function is deprecated; use the SQL statement <code>CREATE DATABASE</code> instead)
<code>mysql_data_seek()</code>	Seeks to an arbitrary row number in a query result set
<code>mysql_debug()</code>	Does a <code>DBUG_PUSH</code> with the given string
<code>mysql_drop_db()</code>	Drops a database (this function is deprecated; use the SQL statement <code>DROP DATABASE</code> instead)
<code>mysql_dump_debug_info()</code>	Makes the server write debug information to the log
<code>mysql_eof()</code>	Determines whether the last row of a result set has been read (this function is deprec-

Function	Description
<code>mysql_errno()</code>	ated; <code>mysql_errno()</code> or <code>mysql_error()</code> may be used instead)
<code>mysql_error()</code>	Returns the error number for the most recently invoked MySQL function
<code>mysql_escape_string()</code>	Returns the error message for the most recently invoked MySQL function
<code>mysql_fetch_field()</code>	Escapes special characters in a string for use in an SQL statement
<code>mysql_fetch_field_direct()</code>	Returns the type of the next table field
<code>mysql_fetch_fields()</code>	Returns the type of a table field, given a field number
<code>mysql_fetch_lengths()</code>	Returns an array of all field structures
<code>mysql_fetch_lengths()</code>	Returns the lengths of all columns in the current row
<code>mysql_fetch_row()</code>	Fetches the next row from the result set
<code>mysql_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_field_seek()</code>	Puts the column cursor on a specified column
<code>mysql_field_tell()</code>	Returns the position of the field cursor used for the last <code>mysql_fetch_field()</code>
<code>mysql_free_result()</code>	Frees memory used by a result set
<code>mysql_get_character_set_info()</code>	Return information about default character set
<code>mysql_get_client_info()</code>	Returns client version information as a string
<code>mysql_get_client_version()</code>	Returns client version information as an integer
<code>mysql_get_host_info()</code>	Returns a string describing the connection
<code>mysql_get_proto_info()</code>	Returns the protocol version used by the connection
<code>mysql_get_server_info()</code>	Returns the server version number
<code>mysql_get_server_version()</code>	Returns version number of server as an integer
<code>mysql_get_ssl_cipher()</code>	Return current SSL cipher
<code>mysql_hex_string()</code>	Encode string in hexadecimal format
<code>mysql_info()</code>	Returns information about the most recently executed query
<code>mysql_init()</code>	Gets or initializes a <code>MYSQL</code> structure
<code>mysql_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by the previous query
<code>mysql_kill()</code>	Kills a given thread
<code>mysql_library_end()</code>	Finalize the MySQL C API library
<code>mysql_library_init()</code>	Initialize the MySQL C API library
<code>mysql_list_dbs()</code>	Returns database names matching a simple regular expression
<code>mysql_list_fields()</code>	Returns field names matching a simple regular expression
<code>mysql_list_processes()</code>	Returns a list of the current server threads
<code>mysql_list_tables()</code>	Returns table names matching a simple regular expression
<code>mysql_load_plugin()</code>	Load a plugin
<code>mysql_load_plugin_v()</code>	Load a plugin
<code>mysql_more_results()</code>	Checks whether any more results exist
<code>mysql_next_result()</code>	Returns/initiates the next result in multiple-result executions
<code>mysql_num_fields()</code>	Returns the number of columns in a result set
<code>mysql_num_rows()</code>	Returns the number of rows in a result set
<code>mysql_options()</code>	Sets connect options for <code>mysql_real_connect()</code>
<code>mysql_ping()</code>	Checks whether the connection to the server is working, reconnecting as necessary
<code>mysql_plugin_options()</code>	Set a plugin option
<code>mysql_query()</code>	Executes an SQL query specified as a null-terminated string
<code>mysql_real_connect()</code>	Connects to a MySQL server
<code>mysql_real_escape_string()</code>	Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection
<code>mysql_real_query()</code>	Executes an SQL query specified as a counted string
<code>mysql_refresh()</code>	Flush or reset tables and caches
<code>mysql_reload()</code>	Tells the server to reload the grant tables

Function	Description
<code>mysql_rollback()</code>	Rolls back the transaction
<code>mysql_row_seek()</code>	Seeks to a row offset in a result set, using value returned from <code>mysql_row_tell()</code>
<code>mysql_row_tell()</code>	Returns the row cursor position
<code>mysql_select_db()</code>	Selects a database
<code>mysql_server_end()</code>	Finalize the MySQL C API library
<code>mysql_server_init()</code>	Initialize the MySQL C API library
<code>mysql_set_character_set()</code>	Set default character set for current connection
<code>mysql_set_local_infile_default()</code>	Set the <code>LOAD DATA LOCAL INFILE</code> handler callbacks to their default values
<code>mysql_set_local_infile_handler()</code>	Install application-specific <code>LOAD DATA LOCAL INFILE</code> handler callbacks
<code>mysql_set_server_option()</code>	Sets an option for the connection (like <code>multi-statements</code>)
<code>mysql_sqlstate()</code>	Returns the SQLSTATE error code for the last error
<code>mysql_shutdown()</code>	Shuts down the database server
<code>mysql_ssl_set()</code>	Prepare to establish SSL connection to server
<code>mysql_stat()</code>	Returns the server status as a string
<code>mysql_store_result()</code>	Retrieves a complete result set to the client
<code>mysql_thread_end()</code>	Finalize thread handler
<code>mysql_thread_id()</code>	Returns the current thread ID
<code>mysql_thread_init()</code>	Initialize thread handler
<code>mysql_thread_safe()</code>	Returns 1 if the clients are compiled as thread-safe
<code>mysql_use_result()</code>	Initiates a row-by-row result set retrieval
<code>mysql_warning_count()</code>	Returns the warning count for the previous SQL statement

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL library by calling `mysql_library_init()`. This function exists in both the `mysqlclient` C client library and the `mysqld` embedded server library, so it is used whether you build a regular client program by linking with the `-libmysqlclient` flag, or an embedded server application by linking with the `-libmysqld` flag.
2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.
3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)
4. Close the connection to the MySQL server by calling `mysql_close()`.
5. End use of the MySQL library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL library. For applications that are linked with the client library, they provide improved memory management. If you don't call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.) For applications that are linked with the embedded server, these calls start and stop the server.

In a nonmulti-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. This should be done prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the host name, user name, and password). Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior. When you are done with the connection, call `mysql_close()` to terminate it.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. They should be treated the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Client programs should choose the approach that is most appropriate for their requirements. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you don't have random access to rows within the result set (you can only access rows sequentially), and you don't know how many rows are in the result set until you have retrieved them all. Furthermore, you *must* retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is nonzero, the statement should have returned rows, but didn't. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` enable you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, enabling you to determine when an error occurred and what it was.

22.9.3. C API Function Descriptions

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and functions returning an integer return zero to indicate success or nonzero to indicate an error. Note that “nonzero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```
if (result)          /* correct */
... error ...
```

```

if (result < 0)           /* incorrect */
... error ...
if (result == -1)         /* incorrect */
... error ...

```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

22.9.3.1. mysql_affected_rows()

```
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

Description

`mysql_affected_rows()` may be called immediately after executing a statement with `mysql_query()` or `mysql_real_query()`. It returns the number of rows changed, deleted, or inserted by the last statement if it was an `UPDATE`, `DELETE`, or `INSERT`. For `SELECT` statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

For `UPDATE` statements, the affected-rows value by default is the number of rows actually changed. If you specify the `CLI-ENT_FOUND_ROWS` flag to `mysql_real_connect()` when connecting to `mysqld`, the affected-rows value is the number of rows “found”; that is, matched by the `WHERE` clause.

For `REPLACE` statements, the affected-rows value is 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

For `INSERT ... ON DUPLICATE KEY UPDATE` statements, the affected-rows value is 1 if the row is inserted as a new row and 2 if an existing row is updated.

Following a `CALL` statement for a stored procedure, `mysql_affected_rows()` returns the value that it would return for the last statement executed within the procedure, or 0 if that statement would return -1. Within the procedure, you can use `ROW_COUNT()` at the SQL level to obtain the affected-rows value for individual statements.

As of MySQL 5.5.5, `mysql_affected_rows()` returns a meaningful value for a wider range of statements. For details, see the description for `ROW_COUNT()` in Section 11.14, “Information Functions”.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_affected_rows()` was called prior to calling `mysql_store_result()`.

Because `mysql_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

Errors

None.

Example

```

char *stmt = "UPDATE products SET cost=cost*1.25
              WHERE group=10";
mysql_query(&mysql,stmt);
printf("%ld products updated",
      (long) mysql_affected_rows(&mysql));

```

22.9.3.2. mysql_autocommit()

```
my_bool mysql_autocommit(MYSQL *mysql, my_bool mode)
```

Description

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

Return Values

Zero if successful. Nonzero if an error occurred.

Errors

None.

22.9.3.3. `mysql_change_user()`

```
my_bool mysql_change_user(MYSQL *mysql, const char *user, const char *password, const  
                           char *db)
```

Description

Changes the user and causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_change_user()` fails if the connected user cannot be authenticated or doesn't have permission to use the database. In this case, the user and database are not changed.

The `db` parameter may be set to `NULL` if you don't want to have a default database.

This command resets the state as if one had done a new connect. (See [Section 22.9.12, “Controlling Automatic Reconnection Behavior”](#).) It always performs a `ROLLBACK` of any active transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system variables are reset to the values of the corresponding global system variables. Prepared statements are released and `HANDLER` variables are closed. Locks acquired with `GET_LOCK()` are released. These effects occur even if the user didn't change.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

The same that you can get from `mysql_real_connect()`.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

- `ER_UNKNOWN_COM_ERROR`

The MySQL server doesn't implement this command (probably an old server).

- `ER_ACCESS_DENIED_ERROR`

The user or password was wrong.

- `ER_BAD_DB_ERROR`

The database didn't exist.

- `ER_DBACCESS_DENIED_ERROR`

The user did not have access rights to the database.

- `ER_WRONG_DB_NAME`

The database name was too long.

Example

```
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
    fprintf(stderr, "Failed to change user. Error: %s\n",
            mysql_error(&mysql));
}
```

22.9.3.4. `mysql_character_set_name()`

```
const char *mysql_character_set_name(MYSQL *mysql)
```

Description

Returns the default character set name for the current connection.

Return Values

The default character set name

Errors

None.

22.9.3.5. `mysql_close()`

```
void mysql_close(MYSQL *mysql)
```

Description

Closes a previously opened connection. `mysql_close()` also deallocates the connection handle pointed to by `mysql` if the handle was allocated automatically by `mysql_init()` or `mysql_connect()`.

Return Values

None.

Errors

None.

22.9.3.6. `mysql_commit()`

```
my_bool mysql_commit(MYSQL *mysql)
```

Description

Commits the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is `RELEASE` (or 2), the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

Return Values

Zero if successful. Nonzero if an error occurred.

Errors

None.

22.9.3.7. `mysql_connect()`

```
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const char
                      *passwd)
```

Description

This function is deprecated. Use `mysql_real_connect()` instead.

`mysql_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_connect()` must complete successfully before you can execute any of the other API functions, with the exception of `mysql_get_client_info()`.

The meanings of the parameters are the same as for the corresponding parameters for `mysql_real_connect()` with the difference that the connection parameter may be `NULL`. In this case, the C API allocates memory for the connection structure automatically and frees it when you call `mysql_close()`. The disadvantage of this approach is that you can't retrieve an error message if the connection fails. (To get error information from `mysql_errno()` or `mysql_error()`, you must provide a valid `MYSQL` pointer.)

Return Values

Same as for `mysql_real_connect()`.

Errors

Same as for `mysql_real_connect()`.

22.9.3.8. `mysql_create_db()`

```
int mysql_create_db(MYSQL *mysql, const char *db)
```

Description

Creates the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `CREATE DATABASE` statement instead.

Return Values

Zero if the database was created successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

```
if(mysql_create_db(&mysql, "my_database"))
{
    fprintf(stderr, "Failed to create new database.  Error: %s\n",
            mysql_error(&mysql));
}
```

22.9.3.9. `mysql_data_seek()`

```
void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a query result set. The `offset` value is a row number and should be in the range from `0` to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used

only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

None.

Errors

None.

22.9.3.10. `mysql_debug()`

```
void mysql_debug(const char *debug)
```

Description

Does a `DEBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See [MySQL Internals: Porting](#).

Return Values

None.

Errors

None.

Example

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```
mysql_debug("d:t:o,/tmp/client.trace");
```

22.9.3.11. `mysql_drop_db()`

```
int mysql_drop_db(MYSQL *mysql, const char *db)
```

Description

Drops the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `DROP DATABASE` statement instead.

Return Values

Zero if the database was dropped successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

```
if(mysql_drop_db(&mysql, "my_database"))
```

```
fprintf(stderr, "Failed to drop the database: Error: %s\n",
        mysql_error(&mysql));
```

22.9.3.12. `mysql_dump_debug_info()`

```
int mysql_dump_debug_info(MYSQL *mysql)
```

Description

Instructs the server to write some debug information to the log. For this to work, the connected user must have the `SUPER` privilege.

Return Values

Zero if the command was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

22.9.3.13. `mysql_eof()`

```
my_bool mysql_eof(MYSQL_RES *result)
```

Description

This function is deprecated. `mysql_errno()` or `mysql_error()` may be used instead.

`mysql_eof()` determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to `mysql_store_result()`, the client receives the entire set in one operation. In this case, a `NULL` return from `mysql_fetch_row()` always means the end of the result set has been reached and it is unnecessary to call `mysql_eof()`. When used with `mysql_store_result()`, `mysql_eof()` always returns true.

On the other hand, if you use `mysql_use_result()` to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call `mysql_fetch_row()` repeatedly. Because an error may occur on the connection during this process, a `NULL` return value from `mysql_fetch_row()` does not necessarily mean the end of the result set was reached normally. In this case, you can use `mysql_eof()` to determine what happened. `mysql_eof()` returns a nonzero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because `mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

Return Values

Zero if no error occurred. Nonzero if the end of the result set has been reached.

Errors

None.

Example

The following example shows how you might use `mysql_eof()`:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(mysql_errno(&mysql)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

22.9.3.14. `mysql_errno()`

```
unsigned int mysql_errno(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix C, Errors, Error Codes, and Common Problems](#).

Note that some functions like `mysql_fetch_row()` don't set `mysql_errno()` if they succeed.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and '`42S02`' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Return Values

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

Errors

None.

22.9.3.15. `mysql_error()`

```
const char *mysql_error(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function didn't fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_error()`, the following two tests are equivalent:

```
if(*mysql_error(&mysql))
{
    // an error occurred
```

```

}
if(mysql_error(&mysql)[0])
{
    // an error occurred
}

```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages. See [Section 9.2, “Setting the Error Message Language”](#).

Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

Errors

None.

22.9.3.16. `mysql_escape_string()`

You should use `mysql_real_escape_string()` instead!

This function is identical to `mysql_real_escape_string()` except that `mysql_real_escape_string()` takes a connection handler as its first argument and escapes the string according to the current character set. `mysql_escape_string()` does not take a connection argument and does not respect the current character set.

22.9.3.17. `mysql_fetch_field()`

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL doesn't know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left.

Errors

None.

Example

```

MYSQL_FIELD *field;
while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}

```

22.9.3.18. `mysql_fetch_field_direct()`

```
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int fieldnr)
```

Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. You may use this function to retrieve the definition for an arbitrary column. The value of `fieldnr` should be in the range from 0 to `mysql_num_fields(result)-1`.

Return Values

The `MYSQL_FIELD` structure for the specified column.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

22.9.3.19. `mysql_fetch_fields()`

```
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```

Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}
```

22.9.3.20. `mysql_fetch_lengths()`

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null characters). `NULL` if an error occurred.

Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling

`mysql_fetch_row()` or after retrieving all rows in the result.

Example

```
MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("Column %u is %lu bytes in length.\n",
               i, lengths[i]);
    }
}
```

22.9.3.21. `mysql_fetch_row()`

`MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)`

Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

Errors

Note that error is not reset between calls to `mysql_fetch_row()`

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

```
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("[%.*s] ", (int) lengths[i],
               row[i] ? row[i] : "NULL");
    }
    printf("\n");
}
```

22.9.3.22. `mysql_field_count()`

```
unsigned int mysql_field_count(MYSQL *mysql)
```

Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT-like`) statement. The example shown here illustrates how this may be done.

See [Section 22.9.11.1, “Why `mysql_store_result\(\)` Sometimes Returns `NULL` After `mysql_query\(\)` Returns Success”](#).

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if(mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
        else // mysql_store_result() should have returned data
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
    }
}
```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a `SELECT`.

22.9.3.23. `mysql_field_seek()`

```
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)
```

Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

Return Values

The previous value of the field cursor.

Errors

None.

22.9.3.24. `mysql_field_tell()`

```
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

Return Values

The current offset of the field cursor.

Errors

None.

22.9.3.25. `mysql_free_result()`

```
void mysql_free_result(MYSQL_RES *result)
```

Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

Return Values

None.

Errors

None.

22.9.3.26. `mysql_get_character_set_info()`

```
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

Description

This function provides information about the default client character set. The default character set may be changed with the `mysql_set_character_set()` function.

Example

This example shows the fields that are available in the `MY_CHARSET_INFO` structure:

```
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set+collation number: %d\n", cs.number);
    printf("character set name: %s\n", cs.name);
    printf("collation name: %s\n", cs.csname);
    printf("comment: %s\n", cs.comment);
    printf("directory: %s\n", cs.dir);
    printf("multi byte character min. length: %d\n", cs.mbmpminlen);
    printf("multi byte character max. length: %d\n", cs.mbmpmaxlen);
}
```

22.9.3.27. `mysql_get_client_info()`

```
const char *mysql_get_client_info(void)
```

Description

Returns a string that represents the client library version.

Return Values

A character string that represents the MySQL client library version.

Errors

None.

22.9.3.28. `mysql_get_client_version()`

```
unsigned long mysql_get_client_version(void)
```

Description

Returns an integer that represents the client library version. The value has the format `XYYZZ` where `X` is the major version, `YY` is the release level, and `ZZ` is the version number within the release level. For example, a value of `40102` represents a client library version of `4.1.2`.

Return Values

An integer that represents the MySQL client library version.

Errors

None.

22.9.3.29. `mysql_get_host_info()`

```
const char *mysql_get_host_info(MYSQL *mysql)
```

Description

Returns a string describing the type of connection in use, including the server host name.

Return Values

A character string representing the server host name and the connection type.

Errors

None.

22.9.3.30. `mysql_get_proto_info()`

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

Description

Returns the protocol version used by current connection.

Return Values

An unsigned integer representing the protocol version used by the current connection.

Errors

None.

22.9.3.31. `mysql_get_server_info()`

```
const char *mysql_get_server_info(MYSQL *mysql)
```

Description

Returns a string that represents the server version number.

Return Values

A character string that represents the server version number.

Errors

None.

22.9.3.32. `mysql_get_server_version()`

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

Description

Returns the version number of the server as an integer.

Return Values

A number that represents the MySQL server version in this format:

```
major_version*10000 + minor_version *100 + sub_version
```

For example, 5.1.5 is returned as 50105.

This function is useful in client programs for quickly determining whether some version-specific server capability exists.

Errors

None.

22.9.3.33. `mysql_get_ssl_cipher()`

```
const char *mysql_get_ssl_cipher(MYSQL *mysql)
```

Description

`mysql_get_ssl_cipher()` returns the SSL cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

Return Values

A string naming the SSL cipher used for the connection, or `NULL` if no cipher is being used.

22.9.3.34. `mysql_hex_string()`

```
unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)
```

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in `to` and a terminating null byte is appended.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

The return value can be placed into an SQL statement using either `0xvalue` or `X'value'` format. However, the return value does not include the `0x` or `X'...`. The caller must supply whichever of those is desired.

Example

```
char query[1000],*end;
end = strmov(query,"INSERT INTO test_table values()");
end = strmov(end,"0x");
end += mysql_hex_string(end,"What is this",12);
end = strmov(end,",0x");
end += mysql_hex_string(end,"binary data: \0\r\n",16);
*end++ = ')';
if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
```

```
{    fprintf(stderr, "Failed to insert row, Error: %s\n",
        mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

22.9.3.35. `mysql_info()`

```
const char *mysql_info(MYSQL *mysql)
```

Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- `INSERT INTO ... SELECT ...`
String format: `Records: 100 Duplicates: 0 Warnings: 0`
- `INSERT INTO ... VALUES (...),(...),(...)...`
String format: `Records: 3 Duplicates: 0 Warnings: 0`
- `LOAD DATA INFILE ...`
String format: `Records: 1 Deleted: 0 Skipped: 0 Warnings: 0`
- `ALTER TABLE`
String format: `Records: 3 Duplicates: 0 Warnings: 0`
- `UPDATE`
String format: `Rows matched: 40 Changed: 40 Warnings: 0`

Note that `mysql_info()` returns a non-`NULL` value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

Return Values

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

Errors

None.

22.9.3.36. `mysql_init()`

```
MYSQL *mysql_init(MYSQL *mysql)
```

Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

Return Values

An initialized `MYSQL*` handle. `NULL` if there was insufficient memory to allocate a new object.

Errors

In case of insufficient memory, `NULL` is returned.

22.9.3.37. `mysql_insert_id()`

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` or `UPDATE` statement. Use this function after you have performed an `INSERT` statement into a table that contains an `AUTO_INCREMENT` field, or have used `INSERT` or `UPDATE` to set a column value with `LAST_INSERT_ID(expr)`.

The return value of `mysql_insert_id()` is always zero unless explicitly updated under one of the following conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit nonspecial value.
- In the case of a multiple-row `INSERT` statement, the return value of `mysql_insert_id()` depends on the MySQL server version.

`mysql_insert_id()` returns the *first* automatically generated `AUTO_INCREMENT` value that was *successfully* inserted.

If no rows are successfully inserted, `mysql_insert_id()` returns 0.

- If an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, `mysql_insert_id()` returns the ID of the last inserted row.
- If an `INSERT ... SELECT` statement uses `LAST_INSERT_ID(expr)`, `mysql_insert_id()` returns `expr`.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column or by updating any column to `LAST_INSERT_ID(expr)`.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

The return value of `mysql_insert_id()` can be simplified to the following sequence:

1. If there is an `AUTO_INCREMENT` column, and an automatically generated value was successfully inserted, return the first such value.
2. If `LAST_INSERT_ID(expr)` occurred in the statement, return `expr`, even if there was an `AUTO_INCREMENT` column in the affected table.
3. The return value varies depending on the statement used. When called after an `INSERT` statement:
 - If there is an `AUTO_INCREMENT` column in the table, and there were some explicit values for this column that were successfully inserted into the table, return the last of the explicit values.

When called after an `INSERT ... ON DUPLICATE KEY UPDATE` statement:

- If there is an `AUTO_INCREMENT` column in the table and there were some explicit successfully inserted values, or some updated rows, return the last of the inserted or updated values.

`mysql_insert_id()` returns 0 if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The `LAST_INSERT_ID()` SQL function will contain the value of the first automatically generated value that was successfully inserted. `LAST_INSERT_ID()` is not reset between statements because the value of that function is maintained in the server. Another difference from `mysql_insert_id()` is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific nonspecial value. See [Section 11.14, “Information Functions”](#).

`mysql_insert_id()` returns 0 following a `CALL` statement for a stored procedure that generates an `AUTO_INCREMENT` value because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `LAST_INSERT_ID()` at the SQL level to obtain the `AUTO_INCREMENT` value.

The reason for the differences between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide more exact information about what happens to the `AUTO_INCREMENT` column.

Return Values

Described in the preceding discussion.

Errors

None.

22.9.3.38. `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

Description

Asks the server to kill the thread specified by `pid`.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `KILL` statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

22.9.3.39. `mysql_library_end()`

```
void mysql_library_end(void)
```

Description

This function finalizes the MySQL library. You should call it when you are done using the library (for example, after disconnecting from the server). The action taken by the call depends on whether your application is linked to the MySQL client library or the MySQL embedded server library. For a client program linked against the `libmysqlclient` library by using the `-lmysqlclient` flag, `mysql_library_end()` performs some memory management to clean up. For an embedded server application linked against the `libmysqld` library by using the `-lmysqld` flag, `mysql_library_end()` shuts down the embedded server and then cleans up.

For usage information, see [Section 22.9.2, “C API Function Overview”](#), and [Section 22.9.3.40, “`mysql_library_init\(\)`”](#).

22.9.3.40. `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

Description

This function should be called to initialize the MySQL library before you call any other MySQL function, whether your application is a regular client program or uses the embedded server. If the application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

After your application is done using the MySQL library, call `mysql_library_end()` to clean up. See [Section 22.9.3.39, “`mysql_library_end\(\)`”](#).

The choice of whether the application operates as a regular client or uses the embedded server depends on whether you use the `libmysqlclient` or `libmysqlld` library at link time to produce the final executable. For additional information, see [Section 22.9.2, “C API Function Overview”](#).

In a nonmulti-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. This should be done prior to any other client library call.

The `argc` and `argv` arguments are analogous to the arguments to `main()`, and enable passing of options to the embedded server. For convenience, `argc` may be 0 (zero) if there are no command-line arguments for the server. This is the usual case for applications intended for use only as regular (nonembedded) clients, and the call typically is written as `mysql_library_init(0, NULL, NULL)`.

```
#include <mysql.h>
#include <stdlib.h>

int main(void) {
    if (mysql_library_init(0, NULL, NULL)) {
        fprintf(stderr, "could not initialize MySQL library\n");
        exit(1);
    }
    /* Use any MySQL API functions here */
    mysql_library_end();
    return EXIT_SUCCESS;
}
```

When arguments are to be passed (`argc` is greater than 0), the first element of `argv` is ignored (it typically contains the program name). `mysql_library_init()` makes a copy of the arguments so it is safe to destroy `argv` or `groups` after the call.

For embedded applications, if you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument should be an array of strings that indicate the groups in option files from which options should be read. See [Section 4.2.3.3, “Using Option Files”](#). The final entry in the array should be `NULL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
    "this_program",           /* this string is not used */
    "--datadir=.",
    "--key_buffer_size=32M"
};
static char *server_groups[] = {
    "embedded",
    "server",
    "this_program_SERVER",
    (char *)NULL
};

int main(void) {
    if (mysql_library_init(sizeof(server_args) / sizeof(char *),
                          server_args, server_groups)) {
        fprintf(stderr, "could not initialize MySQL library\n");
        exit(1);
    }
    /* Use any MySQL API functions here */
    mysql_library_end();
    return EXIT_SUCCESS;
}
```

Return Values

Zero if successful. Nonzero if an error occurred.

22.9.3.41. `mysql_list_dbs()`

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW DATABASES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

22.9.3.42. `mysql_list_fields()`

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

Description

Returns a result set consisting of field names in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

It is preferable to use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

22.9.3.43. `mysql_list_processes()`

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

Description

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

22.9.3.44. `mysql_list_tables()`

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW TABLES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

22.9.3.45. `mysql_more_results()`

```
my_bool mysql_more_results(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

`mysql_more_results()` true if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See [Section 22.9.13, “C API Support for Multiple Statement Execution”](#), and [Section 22.9.3.46, “`mysql_next_result\(\)`”](#).

Errors

None.

22.9.3.46. `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you use `CALL` statements to execute stored procedures, which can return multiple result sets.

`mysql_next_result()` reads the next statement result and returns a status to indicate whether more results exist. If `mysql_next_result()` returns an error, there are no more results.

Before each call to `mysql_next_result()`, you must call `mysql_free_result()` for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, you should process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`). As of MySQL 5.5.3, `CLIENT_MULTI_RESULTS` is enabled by default.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_next_result()` to advance to the next result.

For an example that shows how to use `mysql_next_result()`, see [Section 22.9.13, “C API Support for Multiple Statement Execution”](#).

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order. For example, if you didn't call `mysql_use_result()` for a previous result set.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

22.9.3.47. `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

Description

Returns the number of columns in a result set.

Note that you can get the number of columns either from a pointer to a result set or to a connection handle. You would use the connection handle if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 22.9.11.1, “Why `mysql_store_result\(\)` Sometimes Returns `NULL` After `mysql_query\(\)` Returns Success”](#).

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
```

```

        if (mysql_errno(&mysql))
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
        else if (mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}

```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

22.9.3.48. `mysql_num_rows()`

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

22.9.3.49. `mysql_options()`

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)
```

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options.

`mysql_options()` should be called after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, `arg` should point to the value of the integer.

The following list describes the possible options, their effect, and how `arg` is used for each option. Several of the options apply only when the application is linked against the `libmysqld` embedded server library and are unused for applications linked against the `libmysql` client library. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- `MYSQL_DEFAULT_AUTH` (argument type: `char *`)

The name of the authentication plugin to use. This option was added in MySQL 5.5.7.

- `MYSQL_INIT_COMMAND` (argument type: `char *`)

SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.

- `MYSQL_OPT_COMPRESS` (argument: not used)

Use the compressed client/server protocol.

- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)

Connect timeout in seconds.

- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this enables the library to guess whether to use the embedded server or a remote server. “Guess” means that if the host name is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)

If no pointer is given or if pointer points to an `unsigned int` that has a nonzero value, the `LOAD LOCAL INFILE` statement is enabled.

- `MYSQL_OPT_NAMED_PIPE` (argument: not used)

Use named pipes to connect to a MySQL server on Windows, if the server permits named-pipe connections.

- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)

Type of protocol to use. Should be one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for attempts to read from the server. Each attempt uses this timeout value and there are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes. This option works only for TCP/IP connections.

- `MYSQL_OPT_RECONNECT` (argument type: `my_bool *`)

Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly.

- `MYSQL_PLUGIN_DIR` (argument type: `char *`)

The directory in which to look for client plugins. This option was added in MySQL 5.5.7.

- `MYSQL_SET_CLIENT_IP` (argument type: `char *`)

For an application linked against the `libmysqld` embedded server library (when `libmysqld` is compiled with authentication support), this means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` (argument type: `my_bool *`)

Enable or disable verification of the server's Common Name value in its certificate against the host name used when connecting to the server. The connection is rejected if there is a mismatch. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default.

- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this forces the use of the embedded server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this forces the use of a remote server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_RESULT` (argument: not used)

This option is unused.

- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for attempts to write to the server. Each attempt uses this timeout value and there are `net_retry_count` retries if necessary, so the total effective timeout value is `net_retry_count` times the option value.

This option works only for TCP/IP connections.

- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `my_bool *`)

Enable or disable reporting of data truncation errors for prepared statements using the `error` member of `MYSQL_BIND` structures. (Default: enabled.)

- `MYSQL_SECURE_AUTH` (argument type: `my_bool *`)

Whether to connect to a server that does not support the password hashing used in MySQL 4.1.1 and later.

- `MYSQL_SET_CHARSET_DIR` (argument type: `char *`)

The path name to the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char *`)

The name of the character set to use as the default character set. The argument can be `MYSQL_AUTO_DETECT_CHARSET_NAME` to cause the character set to be autodetected based on the operating system setting (see [Section 9.1.4, “Connection Character Sets and Collations”](#)).

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char *`)

The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Should have the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

The `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options.

Option	Description
<code>character-sets-dir=path</code>	The directory where character sets are installed.
<code>compress</code>	Use the compressed client/server protocol.
<code>connect-timeout=seconds</code>	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
<code>database=db_name</code>	Connect to this database if no database was specified in the connect command.
<code>debug</code>	Debug options.
<code>default-character-set=char-set_name</code>	The default character set to use.
<code>disable-local-infile</code>	Disable use of <code>LOAD DATA LOCAL</code> .
<code>host=host_name</code>	Default host name.
<code>init-command=stmt</code>	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
<code>interactive-timeout=seconds</code>	Same as specifying <code>CLIENT_INTERACTIVE</code> to <code>mysql_real_connect()</code> . See Section 22.9.3.52, “mysql_real_connect()” .
<code>local-infile[={0 1}]</code>	If no argument or nonzero argument, enable use of <code>LOAD DATA LOCAL</code> ; otherwise disable.
<code>max_allowed_packet=bytes</code>	Maximum size of packet that client can read from server.
<code>multi-queries, multi-results</code>	Enable multiple result sets from multiple-statement executions or stored procedures.
<code>multi-statements</code>	Enable the client to send multiple statements in a single string (separated by “;”).
<code>password=password</code>	Default password.
<code>pipe</code>	Use named pipes to connect to a MySQL server on Windows.
<code>port=port_num</code>	Default port number.

Option	Description
<code>proto={TCP SOCKET PIPE MEMORY}</code>	The protocol to use when connecting to the server.
<code>return-found-rows</code>	Tell <code>mysql_info()</code> to return found rows instead of updated rows when using <code>UPDATE</code> .
<code>shared-memory-base-name=name</code>	Shared-memory name to use to connect to server.
<code>socket=path</code>	Default socket file.
<code>ssl-ca=file_name</code>	Certificate Authority file.
<code>ssl-capath=path</code>	Certificate Authority directory.
<code>ssl-cert=file_name</code>	Certificate file.
<code>ssl-cipher=cipher_list</code>	Permissible SSL ciphers.
<code>ssl-key=file_name</code>	Key file.
<code>timeout=seconds</code>	Like <code>connect-timeout</code> .
<code>user</code>	Default user.

`timeout` has been replaced by `connect-timeout`, but `timeout` is still supported in MySQL 5.5 for backward compatibility.

For more information about option files, see [Section 4.2.3.3, “Using Option Files”](#).

Return Values

Zero for success. Nonzero if you specify an unknown option.

Example

The following `mysql_options()` calls request the use of compression in the client/server protocol, cause options to be read from the `[odbc]` group of option files, and disable transaction autocommit mode:

```
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql,MYSQL_OPT_COMPRESS,0);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"odbc");
mysql_options(&mysql,MYSQL_INIT_COMMAND,"SET autocommit=0");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

This code requests that the client use the compressed client/server protocol and read the additional options from the `odbc` section in the `my.cnf` file.

22.9.3.50. `mysql_ping()`

```
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down and auto-reconnect is enabled an attempt to reconnect is made. If the connection is down and auto-reconnect is disabled, `mysql_ping()` returns an error.

Auto-reconnect is disabled by default. To enable it, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option. For details, see [Section 22.9.3.49, “mysql_options\(\)”](#).

`mysql_ping()` can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

If `mysql_ping()` does cause a reconnect, there is no explicit indication of it. To determine whether a reconnect occurs, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these characteristics, see [Section 22.9.12, “Controlling Automatic Reconnection Behavior”](#).

Return Values

Zero if the connection to the server is active. Nonzero if an error occurred. A nonzero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

22.9.3.51. `mysql_query()`

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“`;`”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 22.9.13, “C API Support for Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “`\0`” character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 22.9.3.22, “mysql_field_count\(\)”](#).

Return Values

Zero if the statement was successful. Nonzero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

22.9.3.52. `mysql_real_connect()`

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)
```

Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`.

`mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handle structure.

The parameters are specified as follows:

- The first parameter should be the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()` you must call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See [Section 22.9.3.49, “`mysql_options\(\)`”](#).
- The value of `host` may be either a host name or an IP address. If `host` is `NULL` or the string "`localhost`", a connection to the local host is assumed: For Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server. For a `host` value of "`.`" on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
- The `user` parameter contains the user's MySQL login ID. If `user` is `NULL` or the empty string " ", the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the MyODBC section of [Chapter 22, Connectors and APIs](#).
- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This enables the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

Note

Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `latin1`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.
- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.
- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe that should be used. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features.

Flag Name	Flag Description
<code>CLIENT_COMPRESS</code>	Use compression protocol.
<code>CLIENT_FOUND_ROWS</code>	Return the number of found (matched) rows, not the number of changed rows.
<code>CLIENT_IGNORE_SIGPIPE</code>	Prevents the client library from installing a <code>SIGPIPE</code> signal handler. This can be used to avoid conflicts with a handler that the application has already installed.
<code>CLIENT_IGNORE_SPACE</code>	Permit spaces after function names. Makes all functions names reserved words.
<code>CLIENT_INTERACTIVE</code>	Permit <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable is set to the value of the session <code>interactive_timeout</code> variable.
<code>CLIENT_LOCAL_FILES</code>	Enable <code>LOAD DATA LOCAL</code> handling.
<code>CLIENT_MULTI_RESULTS</code>	Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if <code>CLIENT_MULTI_STATEMENTS</code> is enabled. See the note following this table for more information about this flag.
<code>CLIENT_MULTI_STATEMENTS</code>	Tell the server that the client may send multiple statements in a single string (separated by ";"). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
<code>CLIENT_NO_SCHEMA</code>	Do not permit the <code>db_name.tbl_name.col_name</code> syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
<code>CLIENT_ODBC</code>	Unused.

Flag Name	Flag Description
<code>CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the client library. Instead, use <code>mysql_ssl_set()</code> before calling <code>mysql_real_connect()</code> .
<code>CLIENT_REMEMBER_OPTIONS</code>	Remember options specified by calls to <code>mysql_options()</code> . Without this option, if <code>mysql_real_connect()</code> fails, you must repeat the <code>mysql_options()</code> calls before trying to connect again. With this option, the <code>mysql_options()</code> calls need not be repeated.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, you should process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`). As of MySQL 5.5.3, `CLIENT_MULTI_RESULTS` is enabled by default.

If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, you should process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 22.9.13, “C API Support for Multiple Statement Execution”](#).

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string ("").
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

Return Values

A `MYSQL*` connection handle if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

Errors

- `CR_CONN_HOST_ERROR`
Failed to connect to the MySQL server.
- `CR_CONNECTION_ERROR`
Failed to connect to the local MySQL server.
- `CR_IPSOCK_ERROR`
Failed to create an IP socket.
- `CR_OUT_OF_MEMORY`

Out of memory.

- [CR_SOCKET_CREATE_ERROR](#)

Failed to create a Unix socket.

- [CR_UNKNOWN_HOST](#)

Failed to find the IP address for the host name.

- [CR_VERSION_ERROR](#)

A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.

- [CR_NAMEDPIPEOPEN_ERROR](#)

Failed to create a named pipe on Windows.

- [CR_NAMEDPIPEWAIT_ERROR](#)

Failed to wait for a named pipe on Windows.

- [CR_NAMEDPIPESETSTATE_ERROR](#)

Failed to get a pipe handler on Windows.

- [CR_SERVER_LOST](#)

If `connect_timeout > 0` and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

- [CR_ALREADY_CONNECTED](#)

The `MYSQL` connection handle is already connected.

Example

```
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "your_prog_name");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some nonstandard way.

Note that upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

22.9.3.53. `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned long length)
```

Note that `mysql` must be a valid, open connection. This is needed because the escaping depends on the character set in use by the server.

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to an escaped SQL string, taking into account the current character set of the connection. The result is placed in `to` and a terminating null byte is appended. Characters encoded are `NUL` (ASCII 0), “`\n`”, “`\r`”, “`\\"`”, “`\t`”, “`\u0000`”, and Control-Z (see [Section 8.1, “Literal Values”](#)). (Strictly speaking, MySQL requires only that backslash and the quote character used

to quote the string in the query be escaped. This function quotes the other characters to make them easier to read in log files.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and you need room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

If you need to change the character set of the connection, you should use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

Example

```
char query[1000],*end;
end = strmov(query, "INSERT INTO test_table values()");
*end++ = '\'';
end += mysql_real_escape_string(&mysql, end, "What is this",12);
*end++ = '\'';
*end++ = '\'';
*end++ = '\'';
end += mysql_real_escape_string(&mysql, end,"binary data: \0\r\n",16);
*end++ = '\'';
*end++ = ')';
if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

22.9.3.54. `mysql_real_query()`

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

Description

Executes the SQL statement pointed to by `stmt_str`, which should be a string `length` bytes long. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“`;`”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See Section 22.9.13, “C API Support for Multiple Statement Execution”.

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “`\0`” character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See Section 22.9.3.22, “`mysql_field_count()`”.

Return Values

Zero if the statement was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

22.9.3.55. `mysql_refresh()`

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

Description

This function flushes tables or caches, or resets replication server information. The connected user must have the [RELOAD](#) privilege.

The `options` argument is a bit mask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- [REFRESH_GRANT](#)
Refresh the grant tables, like `FLUSH PRIVILEGES`.
- [REFRESH_LOG](#)
Flush the logs, like `FLUSH LOGS`.
- [REFRESH_TABLES](#)
Flush the table cache, like `FLUSH TABLES`.
- [REFRESH_HOSTS](#)
Flush the host cache, like `FLUSH HOSTS`.
- [REFRESH_STATUS](#)
Reset status variables, like `FLUSH STATUS`.
- [REFRESH_THREADS](#)
Flush the thread cache.
- [REFRESH_SLAVE](#)
On a slave replication server, reset the master server information and restart the slave, like `RESET SLAVE`.
- [REFRESH_MASTER](#)
On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like `RESET MASTER`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.

- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

22.9.3.56. `mysql_reload()`

```
int mysql_reload(MYSQL *mysql)
```

Description

Asks the MySQL server to reload the grant tables. The connected user must have the [RELOAD](#) privilege.

This function is deprecated. It is preferable to use [mysql_query\(\)](#) to issue an SQL [FLUSH PRIVILEGES](#) statement instead.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

22.9.3.57. `mysql_rollback()`

```
my_bool mysql_rollback(MYSQL *mysql)
```

Description

Rolls back the current transaction.

The action of this function is subject to the value of the [completion_type](#) system variable. In particular, if the value of [completion_type](#) is [RELEASE](#) (or 2), the server performs a release after terminating a transaction and closes the client connection. The client program should call [mysql_close\(\)](#) to close the connection from the client side.

Return Values

Zero if successful. Nonzero if an error occurred.

Errors

None.

22.9.3.58. `mysql_row_seek()`

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset that should be a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

Errors

None.

22.9.3.59. `mysql_row_tell()`

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

You should use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

22.9.3.60. `mysql_select_db()`

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

22.9.3.61. `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`.

Return Values

Zero for success. Nonzero if an error occurred.

Example

```
MYSQL mysql;
mysql_init(&mysql);
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}

if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
           mysql_character_set_name(&mysql));
}
```

22.9.3.62. `mysql_set_local_infile_default()`

```
void mysql_set_local_infile_default(MYSQL *mysql);
```

Description

Sets the `LOAD LOCAL DATA INFILE` handler callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

Return Values

None.

Errors

None.

22.9.3.63. `mysql_set_local_infile_handler()`

```
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)(void **,
                           const char *, void *), int (*local_infile_read)(void *, char *, unsigned int),
                           void (*local_infile_end)(void *), int (*local_infile_error)(void *, char *, unsigned int),
                           void *userdata);
```

Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argu-

ment is the same value that is passed to `mysql_set_local_infile_handler()`.

The initialization function should return zero for success, nonzero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data should be stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. This function should deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr,
                   char *error_msg,
                   unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message should be written, and `error_msg_len` is the length of the buffer. The message should be written as a null-terminated string, so the message can be at most `error_msg_len`-1 bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

Return Values

None.

Errors

None.

22.9.3.64. `mysql_set_server_option()`

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

Description

Enables or disables an option for the connection. `option` can have one of the following values.

Option	Description
<code>MYSQL_OPTION_MULTI_STATEMENTS_ON</code>	Enable multiple-statement support
<code>MYSQL_OPTION_MULTI_STATEMENTS_OFF</code>	Disable multiple-statement support

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 22.9.13, “C API Support for Multiple Statement Execution”](#).

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL SQL` statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insuffi-

cient to permit the use of `CALL`.

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `ER_UNKNOWN_COM_ERROR`
The server didn't support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server didn't support the option one tried to set.

22.9.3.65. `mysql_shutdown()`

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

Description

Asks the database server to shut down. The connected user must have the `SHUTDOWN` privilege. MySQL 5.5 servers support only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Additional shutdown levels are planned to make it possible to choose the desired level. Dynamically linked executables which have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

The shutdown process is described in [Section 5.1.10, “The Shutdown Process”](#).

Return Values

Zero for success. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

22.9.3.66. `mysql_sqlstate()`

```
const char *mysql_sqlstate(MYSQL *mysql)
```

Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error

code consists of five characters. '00000' means "no error". The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix C, Errors, Error Codes, and Common Problems](#).

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and '`42S02`' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value '`HY000`' (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

Return Values

A null-terminated character string containing the SQLSTATE error code.

See Also

See [Section 22.9.3.14, “mysql_errno\(\)”](#), [Section 22.9.3.15, “mysql_error\(\)”](#), and [Section 22.9.7.27, “mysql_stmt_sqlstate\(\)”](#).

22.9.3.67. `mysql_ssl_set()`

```
my_bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca,
                      const char *capath, const char *cipher)
```

Description

`mysql_ssl_set()` is used for establishing secure connections using SSL. It must be called before `mysql_real_connect()`.

`mysql_ssl_set()` does nothing unless SSL support is enabled in the client library.

`mysql` is the connection handler returned from `mysql_init()`. The other parameters are specified as follows:

- `key` is the path name to the key file.
- `cert` is the path name to the certificate file.
- `ca` is the path name to the certificate authority file.
- `capath` is the path name to a directory that contains trusted SSL CA certificates in pem format.
- `cipher` is a list of permissible ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`.

Return Values

This function always returns `0`. If SSL setup is incorrect, `mysql_real_connect()` returns an error when you attempt to connect.

22.9.3.68. `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Return Values

A character string describing the server status. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

22.9.3.69. `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You don't have to call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a nonzero value (more about this later on).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 22.9.13, “C API Support for Multiple Statement Execution”](#).

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 22.9.3.22, “mysql_field_count\(\)”](#).

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement didn't return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that isn't a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See [Section 22.9.11.1, “Why mysql_store_result\(\) Sometimes Returns NULL After mysql_query\(\) Returns Success”](#).

Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_OUT_OF_MEMORY](#)

Out of memory.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

22.9.3.70. [mysql_thread_id\(\)](#)

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

Description

Returns the thread ID of the current connection. This value can be used as an argument to [mysql_kill\(\)](#) to kill the thread.

If the connection is lost and you reconnect with [mysql_ping\(\)](#), the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Return Values

The thread ID of the current connection.

Errors

None.

22.9.3.71. [mysql_use_result\(\)](#)

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

Description

After invoking [mysql_query\(\)](#) or [mysql_real_query\(\)](#), you must call [mysql_store_result\(\)](#) or [mysql_use_result\(\)](#) for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call [mysql_free_result\(\)](#) after you are done with the result set.

[mysql_use_result\(\)](#) initiates a result set retrieval but does not actually read the result set into the client like [mysql_store_result\(\)](#) does. Instead, each row must be retrieved individually by making calls to [mysql_fetch_row\(\)](#). This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than [mysql_store_result\(\)](#). The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you shouldn't use [mysql_use_result\(\)](#) if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a `^S` (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using [mysql_use_result\(\)](#), you must execute [mysql_fetch_row\(\)](#) until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use [mysql_data_seek\(\)](#), [mysql_row_seek\(\)](#), [mysql_row_tell\(\)](#), [mysql_num_rows\(\)](#), or [mysql_affected_rows\(\)](#) with a result returned from [mysql_use_result\(\)](#), nor may you issue other queries until [mysql_use_result\(\)](#) has finished. (However, after you have fetched all the rows, [mysql_num_rows\(\)](#) accurately returns the number of rows fetched.)

You must call [mysql_free_result\(\)](#) once you are done with the result set.

When using the `libmysqld` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

22.9.3.72. `mysql_warning_count()`

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

Description

Returns the number of warnings generated during execution of the previous SQL statement.

Return Values

The warning count.

Errors

None.

22.9.4. C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handle returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and nonprepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

The following SQL statements can be used as prepared statements:

```
CALL
```

```

CREATE TABLE
DELETE
DO
INSERT
REPLACE
SELECT
SET
UPDATE
ANALYZE TABLE
OPTIMIZE TABLE
REPAIR TABLE
CACHE INDEX
CHANGE MASTER
CHECKSUM {TABLE | TABLES}
{CREATE | RENAME | DROP} DATABASE
{CREATE | RENAME | DROP} USER
FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
| LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
GRANT
REVOKE
KILL
LOAD INDEX INTO CACHE
RESET {MASTER | SLAVE | QUERY CACHE}
SHOW BINLOG EVENTS
SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
SHOW {MASTER | BINARY} LOGS
SHOW {MASTER | SLAVE} STATUS
SLAVE {START | STOP}
INSTALL PLUGIN
UNINSTALL PLUGIN

```

Other statements are not yet supported in MySQL 5.5.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see [Section 12.6.4, “Automatic Prepared Statement Repreparation”](#).

22.9.5. C API Prepared Statement Data Structures

Prepared statements use several data structures:

- To obtain a statement handle, pass a `MYSQL` connection handler to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure. This structure is used for further operations with the statement. To specify the statement to prepare, pass the `MYSQL_STMT` pointer and the statement string to `mysql_stmt_prepare()`.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.
- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail. For examples that show how to use them, see [Section 22.9.7.10, “`mysql_stmt_execute\(\)`”, and Section 22.9.7.11, “`mysql_stmt_fetch\(\)`”](#).

- **`MYSQL_STMT`**

This structure is a handle for a prepared statement. A handle is created by calling `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT`. The handle is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handle becomes invalid.

The `MYSQL_STMT` structure has no members intended for application use. Applications should not try to copy a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handles can be associated with a single connection. The limit on the number of handles depends on the available system resources.

- **`MYSQL_BIND`**

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

- For input, use `MYSQL_BIND` structures with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
- For output, use `MYSQL_BIND` structures with `mysql_stmt_bind_result()` to bind buffers to result set columns, for

use in fetching rows with `mysql_stmt_fetch()`.

To use a `MYSQL_BIND` structure, zero its contents to initialize it, then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

- `enum enum_field_types buffer_type`

The type of the buffer. This member indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored. For permissible `buffer_type` values, see [Section 22.9.5.1, “C API Prepared Statement Type Codes”](#).

- `void *buffer`

A pointer to the buffer to be used for data transfer. This is the address of a C language variable.

For input, `buffer` is a pointer to the variable in which you store the data value for a statement parameter. When you call `mysql_stmt_execute()`, MySQL uses the value stored in the variable in place of the corresponding parameter marker in the statement (specified with `?` in the statement string).

For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL stores a column value from the current row of the result set in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use C variables that have types similar to those of the corresponding SQL values:

- For numeric data types, `buffer` should point to a variable of the proper numeric C type. For integer variables (which can be `char` for single-byte values or an integer type for larger values), you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later.
- For character (nonbinary) and binary string data types, `buffer` should point to a character buffer.
- For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

For guidelines about mapping between C types and SQL types and notes about type conversions, see [Section 22.9.5.1, “C API Prepared Statement Type Codes”](#), and [Section 22.9.5.2, “C API Prepared Statement Type Conversions”](#).

- `unsigned long buffer_length`

The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer.length` is used for character or binary C data.

For input parameter data binding, set `*length` to indicate the actual length of the parameter value stored in `*buffer`. This is used by `mysql_stmt_execute()`.

For output value binding, MySQL sets `*length` when you call `mysql_stmt_fetch()`. The `mysql_stmt_fetch()` return value determines how to interpret the length:

- If the return value is 0, `*length` indicates the actual length of the parameter value.
- If the return value is `MYSQL_DATA_TRUNCATED`, `*length` indicates the nontruncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

`length` is ignored for numeric and temporal data types because the `buffer_type` value determines the length of the data value.

If you must determine the length of a returned value before fetching it, see [Section 22.9.7.11, “mysql_stmt_fetch\(\)”](#), for some strategies.

- `my_bool *is_null`

This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

`is_null` is a *pointer* to a boolean scalar, not a boolean scalar, to provide flexibility in how you specify `NULL` values:

- If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column. The other `MYSQL_BIND` members, including `is_null`, do not matter.
- If your data values are always `NOT NULL`, set `is_null = (my_bool*) 0`, and set the other members appropriately for the variable you are binding.
- In all other cases, set the other members appropriately and set `is_null` to the address of a `my_bool` variable. Set that variable's value to true or false appropriately between executions to indicate whether the corresponding data value is `NULL` or `NOT NULL`, respectively.

For output, when you fetch a row, MySQL sets the value pointed to by `is_null` to true or false according to whether the result set column value returned from the statement is or is not `NULL`.

- `my_bool is_unsigned`

This member applies for C variables with data types that can be `unsigned (char, short int, int, long long int)`. Set `is_unsigned` to true if the variable pointed to by `buffer` is `unsigned` and false otherwise. For example, if you bind a `signed char` variable to `buffer`, specify a type code of `MYSQL_TYPE_TINY` and set `is_unsigned` to false. If you bind an `unsigned char` instead, the type code is the same but `is_unsigned` should be true. (For `char`, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using `signed char` or `unsigned char`.)

`is_unsigned` applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an `int` variable to supply a value for a `BIGINT UNSIGNED` column, `is_unsigned` should be false because `int` is a signed type. If you use an `unsigned int` variable to supply a value for a `BIGINT` column, `is_unsigned` should be true because `unsigned int` is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- `my_bool *error`

For output, set this member to point to a `my_bool` variable to have truncation information for the parameter stored there after a row fetching operation. When truncation reporting is enabled, `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED` and `*error` is true in the `MYSQL_BIND` structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. Set the `buffer` member to point to a `MYSQL_TIME` structure, and set the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types (`MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATE`, `MYSQL_TYPE_DATETIME`, `MYSQL_TYPE_TIMESTAMP`).

The `MYSQL_TIME` structure contains the members listed in the following table.

Member	Description
<code>unsigned int year</code>	The year
<code>unsigned int month</code>	The month of the year
<code>unsigned int day</code>	The day of the month
<code>unsigned int hour</code>	The hour of the day
<code>unsigned int minute</code>	The minute of the hour
<code>unsigned int second</code>	The second of the minute
<code>my_bool neg</code>	A boolean flag indicating whether the time is negative

Member	Description
<code>unsigned long second_part</code>	The fractional part of the second in microseconds; currently unused

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See [Section 22.9.15, “C API Prepared Statement Handling of Date and Time Values”](#).

22.9.5.1. C API Prepared Statement Type Codes

The `buffer_type` member of `MYSQL_BIND` structures indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for input values sent to the server. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

Input Variable C Type	buffer_type Value	SQL Type of Destination Value
<code>signed char</code>	<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code>
<code>short int</code>	<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code>
<code>int</code>	<code>MYSQL_TYPE_LONG</code>	<code>INT</code>
<code>long long int</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code>
<code>float</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code>
<code>double</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIME</code>	<code>TIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATE</code>	<code>DATE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code>
<code>char[]</code>	<code>MYSQL_TYPE_STRING</code>	<code>TEXT, CHAR, VARCHAR</code>
<code>char[]</code>	<code>MYSQL_TYPE_BLOB</code>	<code>BLOB, BINARY, VARBINARY</code>
	<code>MYSQL_TYPE_NULL</code>	<code>NULL</code>

Use `MYSQL_TYPE_NULL` as indicated in the description for the `is_null` member in [Section 22.9.5, “C API Prepared Statement Data Structures”](#).

For input string data, use `MYSQL_TYPE_STRING` or `MYSQL_TYPE_BLOB` depending on whether the value is a character (nonbinary) or binary string:

- `MYSQL_TYPE_STRING` indicates character input string data. The value is assumed to be in the character set indicated by the `character_set_client` system variable. If the server stores the value into a column with a different character set, it converts the value to that character set.
- `MYSQL_TYPE_BLOB` indicates binary input string data. The value is treated as having the `binary` character set. That is, it is treated as a byte string and no conversion occurs.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for output values received from the server. The table shows the SQL types of received values, the corresponding type codes that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

SQL Type of Received Value	buffer_type Value	Output Variable C Type
<code>TINYINT</code>	<code>MYSQL_TYPE_TINY</code>	<code>signed char</code>

SQL Type of Received Value	buffer_type Value	Output Variable C Type
SMALLINT	MYSQL_TYPE_SHORT	short int
MEDIUMINT	MYSQL_TYPE_INT24	int
INT	MYSQL_TYPE_LONG	int
BIGINT	MYSQL_TYPE_LONGLONG	long long int
FLOAT	MYSQL_TYPE_FLOAT	float
DOUBLE	MYSQL_TYPE_DOUBLE	double
DECIMAL	MYSQL_TYPE_NEWDECIMAL	char[]
YEAR	MYSQL_TYPE_SHORT	short int
TIME	MYSQL_TYPE_TIME	MYSQL_TIME
DATE	MYSQL_TYPE_DATE	MYSQL_TIME
DATETIME	MYSQL_TYPE_DATETIME	MYSQL_TIME
TIMESTAMP	MYSQL_TYPE_TIMESTAMP	MYSQL_TIME
CHAR, BINARY	MYSQL_TYPE_STRING	char[]
VARCHAR, VARBINARY	MYSQL_TYPE_VAR_STRING	char[]
TINYBLOB, TINYTEXT	MYSQL_TYPE_TINY_BLOB	char[]
BLOB, TEXT	MYSQL_TYPE_BLOB	char[]
MEDIUMBLOB, MEDIUMTEXT	MYSQL_TYPE_MEDIUM_BLOB	char[]
LONGBLOB, LONGTEXT	MYSQL_TYPE_LONG_BLOB	char[]
BIT	MYSQL_TYPE_BIT	char[]

22.9.5.2. C API Prepared Statement Type Conversions

Prepared statements transmit data between the client and server using C language variables on the client side that correspond to SQL values on the server side. If there is a mismatch between the C variable type on the client side and the corresponding SQL value type on the server side, MySQL performs implicit type conversions in both directions.

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value in the `MYSQL_BIND` structure indicates the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL converts the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array is a 4-byte string '`255\0`'.
- MySQL returns `DECIMAL` values as the string representation of the original server-side value, which is why the corresponding C type is `char[]`. For example, `12.345` is returned to the client as '`12.345`'. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer as a string without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer, which is why the corresponding C type is `char[]`. The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

```
SELECT bit_col + 0 FROM t
SELECT CAST(bit_col AS UNSIGNED) FROM t
```

To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type

codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in [Section 22.9.7.23, “mysql_stmt_result_metadata\(\)”](#), and [Section 22.9.1, “C API Data Structures”](#).

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see [Section 22.9.1, “C API Data Structures”](#)). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. Choose the size of the buffers according to the types of the variables into which you fetch the values. For example, a `TINYINT` column containing the value -128 might have a `max_length` value of 4. But the binary representation of any `TINYINT` value requires only 1 byte for storage, so you can supply a `signed char` variable in which to store the value and set `is_unsigned` to indicate that values are signed.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see [Section 12.6.4, “Automatic Prepared Statement Repreparation”](#).

22.9.6. C API Prepared Statement Function Overview

The functions available for prepared statement processing are summarized here and described in greater detail in a later section. See [Section 22.9.7, “C API Prepared Statement Function Descriptions”](#).

Function	Description
<code>mysql_stmt_affected_rows()</code>	Returns the number of rows changed, deleted, or inserted by prepared <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> statement
<code>mysql_stmt_attr_get()</code>	Gets value of an attribute for a prepared statement
<code>mysql_stmt_attr_set()</code>	Sets an attribute for a prepared statement
<code>mysql_stmt_bind_param()</code>	Associates application data buffers with the parameter markers in a prepared SQL statement
<code>mysql_stmt_bind_result()</code>	Associates application data buffers with columns in a result set
<code>mysql_stmt_close()</code>	Frees memory used by a prepared statement
<code>mysql_stmt_data_seek()</code>	Seeks to an arbitrary row number in a statement result set
<code>mysql_stmt_errno()</code>	Returns the error number for the last statement execution
<code>mysql_stmt_error()</code>	Returns the error message for the last statement execution
<code>mysql_stmt_execute()</code>	Executes a prepared statement
<code>mysql_stmt_fetch()</code>	Fetches the next row of data from a result set and returns data for all bound columns
<code>mysql_stmt_fetch_column()</code>	Fetch data for one column of the current row of a result set
<code>mysql_stmt_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_stmt_free_result()</code>	Free the resources allocated to a statement handle
<code>mysql_stmt_init()</code>	Allocates memory for a <code>MYSQL_STMT</code> structure and initializes it
<code>mysql_stmt_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by a prepared statement
<code>mysql_stmt_next_result()</code>	Returns/initiates the next result in a multiple-result execution
<code>mysql_stmt_num_rows()</code>	Returns the row count from a buffered statement result set
<code>mysql_stmt_param_count()</code>	Returns the number of parameters in a prepared statement
<code>mysql_stmt_param_metadata()</code>	(Return parameter metadata in the form of a result set) Currently, this function does nothing
<code>mysql_stmt_prepare()</code>	Prepares an SQL statement string for execution
<code>mysql_stmt_reset()</code>	Resets the statement buffers in the server
<code>mysql_stmt_result_metadata()</code>	Returns prepared statement metadata in the form of a result set
<code>mysql_stmt_row_seek()</code>	Seeks to a row offset in a statement result set, using value returned from <code>mysql_stmt_row_tell()</code>
<code>mysql_stmt_row_tell()</code>	Returns the statement row cursor position
<code>mysql_stmt_send_long_data()</code>	Sends long data in chunks to server

Function	Description
<code>mysql_stmt_sqlstate()</code>	Returns the SQLSTATE error code for the last statement execution
<code>mysql_stmt_store_result()</code>	Retrieves a complete result set to the client

Call `mysql_stmt_init()` to create a statement handle, then `mysql_stmt_prepare()` to prepare the statement string, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

You can send text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See [Section 22.9.7.26, “mysql_stmt_send_long_data\(\)”](#).

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

When statement execution has been completed, close the statement handle using `mysql_stmt_close()` so that all resources associated with it can be freed.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handle with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement will produce a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handle and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and the number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the current row of the result set and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error number, error message, and SQLSTATE code using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

- Call `mysql_stmt_prepare()` to prepare the statement string "SELECT ?".
- Call `mysql_stmt_bind_param()` to bind the value 3 to the parameter in the prepared statement.
- Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare [1] SELECT ?
Execute [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. `N` is a positive integer. If there are multiple prepared statements active simultaneously for the client, `N` may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

22.9.7. C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handle, use the `mysql_stmt_init()` function.

22.9.7.1. `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_affected_rows()` may be called immediately after executing a statement with `mysql_stmt_execute()`. It is like `mysql_affected_rows()` but for prepared statements. For a description of what the affected-rows value returned by this function means, See [Section 22.9.3.1, “`mysql_affected_rows\(\)`”](#).

Errors

None.

Example

See the Example in [Section 22.9.7.10, “`mysql_stmt_execute\(\)`”](#).

22.9.7.2. `mysql_stmt_attr_get()`

```
my_bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void
                           *arg)
```

Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, `arg` should point to the value of the integer.

See [Section 22.9.7.3, “mysql_stmt_attr_get\(\)”](#), for a list of options and option types.

Return Values

Zero if successful. Nonzero if `option` is unknown.

Errors

None.

22.9.7.3. mysql_stmt_attr_set()

```
my_bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values.

Option	Argument Type	Function
STMT_ATTR_UPDATE_MAX_LENGTH	<code>my_bool *</code>	If set to 1, causes <code>mysql_stmt_store_result()</code> to update the metadata <code>MYSQL_FIELD->max_length</code> value.
STMT_ATTR_CURSOR_TYPE	<code>unsigned long *</code>	Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. <code>*arg</code> can be <code>CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>CURSOR_TYPE_READ_ONLY</code> .
STMT_ATTR_PREFETCH_ROWS	<code>unsigned long *</code>	Number of rows to fetch from server at a time when using a cursor. <code>*arg</code> can be in the range from 1 to the maximum value of <code>unsigned long</code> . The default is 1.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

Return Values

Zero if successful. Nonzero if `option` is unknown.

Errors

None.

Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;
```

```

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                        (void*) &prefetch_rows);
/* ... check return value ... */

```

22.9.7.4. `mysql_stmt_bind_param()`

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each “?” parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?, ?, ?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

[Section 22.9.5, “C API Prepared Statement Data Structures”](#), describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

See the Example in [Section 22.9.7.10, “`mysql_stmt_execute\(\)`”](#).

22.9.7.5. `mysql_stmt_bind_result()`

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol doesn't return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the

next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. [Section 22.9.5, “C API Prepared Statement Data Structures”](#), describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

Return Values

Zero if the bind operation was successful. Nonzero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

See the Example in [Section 22.9.7.11, “mysql_stmt_fetch\(\)”](#).

22.9.7.6. `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT * )
```

Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handle pointed to by `stmt`.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Return Values

Zero if the statement was freed successfully. Nonzero if an error occurred.

Errors

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

See the Example in [Section 22.9.7.10, “mysql_stmt_execute\(\)”](#).

22.9.7.7. `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

None.

Errors

None.

22.9.7.8. `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix C, Errors, Error Codes, and Common Problems](#).

Return Values

An error code value. Zero if no error occurred.

Errors

None.

22.9.7.9. `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string (" ") is returned if no error occurred. This means the following two tests are equivalent:

```
if(*mysql_stmt_errno(stmt))
{
    // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages.

Return Values

A character string that describes the error. An empty string if no error occurred.

Errors

None.

22.9.7.10. `mysql_stmt_execute()`

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an `UPDATE`, `DELETE`, or `INSERT`, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.
- For a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to [Section 22.9.7.11, “mysql_stmt_fetch\(\)”](#).

Do not follow invocation of `mysql_stmt_execute()` with a call to `mysql_store_result()` or `mysql_use_result()`. Those functions are not intended for processing results from prepared statements.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see [Section 12.6.4, “Automatic Prepared Statement Repreparation”](#).

Return Values

Zero if execution was successful. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handle. For an example that shows how to retrieve data, see [Section 22.9.7.11, “mysql_stmt_fetch\(\)”](#).

```
#define STRING_SIZE 50
#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\n                           col2 VARCHAR(40),\n                           col3 SMALLINT,\n                           col4 TIMESTAMP)"
#define INSERT_SAMPLE "INSERT INTO \
                           test_table(col1,col2,col3) \
                           VALUES(?, ?, ?)"

MYSQL_STMT    *stmt;
MYSQL_BIND    bind[3];
my_ulonglong affected_rows;
int           param_count;
short          small_data;
int            int_data;
```

```

char          str_data[STRING_SIZE];
unsigned long str_length;
my_bool       is_null;

if (mysql_query(mysql, DROP_SAMPLE_TABLE))
{
    fprintf(stderr, " DROP TABLE failed\n");
    fprintf(stderr, " %s\n", mysql_error(mysql));
    exit(0);
}

        (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, "%s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

Note

For complete examples on the use of prepared statement functions, refer to the file [tests/mysql_client_test.c](#). This file can be obtained from a MySQL source distribution or from the Bazaar source repository.

22.9.7.11. `mysql_stmt_fetch()`

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that produces a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains TRUE (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
<code>MYSQL_TYPE_TINY</code>	1
<code>MYSQL_TYPE_SHORT</code>	2
<code>MYSQL_TYPE_LONG</code>	4
<code>MYSQL_TYPE_LONGLONG</code>	8
<code>MYSQL_TYPE_FLOAT</code>	4

Type	Length
MYSQL_TYPE_DOUBLE	8
MYSQL_TYPE_TIME	<code>sizeof(MYSQL_TIME)</code>
MYSQL_TYPE_DATE	<code>sizeof(MYSQL_TIME)</code>
MYSQL_TYPE_DATETIME	<code>sizeof(MYSQL_TIME)</code>
MYSQL_TYPE_STRING	<code>data_length</code>
MYSQL_TYPE_BLOB	<code>data_length</code>

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()`, then invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Setting the `STMT_ATTR_UPDATE_MAX_LENGTH` attribute causes the maximal length of column values to be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`.
- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```
real_length= 0;
bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length;
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
    bind[0].buffer_length= real_length;
    mysql_stmt_fetch_column(stmt, bind, 0, 0);
}
```

Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling <code>mysql_stmt_errno()</code> and <code>mysql_stmt_error()</code> .
MYSQL_NO_DATA	No more rows/data exists
MYSQL_DATA_TRUNCATED	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is returned when truncation reporting is enabled. To determine which column values were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` structures used for fetching values. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

- [CR_UNSUPPORTED_PARAM_TYPE](#)

The buffer type is `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, but the data type is not `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP`.

- All other unsupported conversion errors are returned from `mysql_stmt_bind_result()`.

Example

The following example demonstrates how to fetch data from a table using `mysql_stmt_result_metadata()`, `mysql_stmt_bind_result()`, and `mysql_stmt_fetch()`. (This example expects to retrieve the two rows inserted by the example shown in [Section 22.9.7.10, “mysql_stmt_execute\(\)”](#).) The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50
#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 \
    FROM test_table"

MYSQL_STMT    *stmt;
MYSQL_BIND     bind[4];
MYSQL_RES     *prepare_meta_result;
MYSQL_TIME    ts;

                ts.year, ts.month, ts.day,
                ts.hour, ts.minute, ts.second,
                length[3]);
    fprintf(stdout, "\n");
}

```

```
/* Validate rows fetched */
fprintf(stdout, " total rows fetched: %d\n", row_count);
if (row_count != 2)
{
    fprintf(stderr, " MySQL failed to return all rows\n");
    exit(0);
}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
```

22.9.7.12. `mysql_stmt_fetch_column()`

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)
```

Description

Fetch one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

Return Values

Zero if the value was fetched successfully. Nonzero if an error occurred.

Errors

- `CR_INVALID_PARAMETER_NO`

Invalid column number.

- `CR_NO_DATA`

The end of the result set has already been reached.

22.9.7.13. `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

22.9.7.14. `mysql_stmt_free_result()`

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

Return Values

Zero if the result set was freed successfully. Nonzero if an error occurred.

Errors

22.9.7.15. `mysql_stmt_init()`

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

Description

Create a `MYSQL_STMT` handle. The handle should be freed with `mysql_stmt_close(MYSQL_STMT *)`.

See also [Section 22.9.5, “C API Prepared Statement Data Structures”](#), for more information.

Return Values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

Errors

- `CR_OUT_OF_MEMORY`

Out of memory.

22.9.7.16. `mysql_stmt_insert_id()`

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed a prepared `INSERT` statement on a table which contains an `AUTO_INCREMENT` field.

See [Section 22.9.3.37, “`mysql_insert_id\(\)`”](#), for more information.

Return Values

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

Errors

None.

22.9.7.17. `mysql_stmt_next_result()`

```
int mysql_stmt_next_result(MYSQL_STMT *mysql)
```

Description

This function is used when you use prepared `CALL` statements to execute stored procedures, which can return multiple result sets. Use a loop that calls `mysql_stmt_next_result()` to determine whether there are more results. If a procedure has `OUT` or `INOUT` parameters, their values will be returned as a single-row result set following any other result sets. The values will appear in the order in which they are declared in the procedure parameter list.

`mysql_stmt_next_result()` returns a status to indicate whether more results exist. If `mysql_stmt_next_result()` returns an error, there are no more results.

Before each call to `mysql_stmt_next_result()`, you must call `mysql_stmt_free_result()` for the current result if it produced a result set (rather than just a result status).

After calling `mysql_stmt_next_result()` the state of the connection is as if you had called `mysql_stmt_execute()`. This means that you can call `mysql_stmt_bind_result()`, `mysql_stmt_affected_rows()`, and so forth.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_stmt_next_result()` to advance to the next result.

For an example that shows how to use `mysql_stmt_next_result()`, see [Section 22.9.16, “C API Support for Prepared CALL Statements”](#).

`mysql_stmt_next_result()` was added in MySQL 5.5.3.

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

22.9.7.18. `mysql_stmt_num_rows()`

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

Description

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handle. If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

22.9.7.19. `mysql_stmt_param_count()`

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

See the Example in [Section 22.9.7.10, “mysql_stmt_execute\(\)”](#).

22.9.7.20. mysql_stmt_param_metadata()

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

Description

Return Values

Errors

22.9.7.21. mysql_stmt_prepare()

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
```

Description

Given the statement handle returned by [mysql_stmt_init\(\)](#), prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (“;”) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (“?”) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are permitted in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not permitted for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using [mysql_stmt_bind_param\(\)](#) before executing the statement.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. For more information, see [Section 12.6.4, “Automatic Prepared Statement Repreparation”](#).

Return Values

Zero if the statement was prepared successfully. Nonzero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

See the Example in [Section 22.9.7.10, “`mysql_stmt_execute\(\)`”](#).

22.9.7.22. `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

Description

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using `mysql_stmt_send_long_data()`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

Return Values

Zero if the statement was reset successfully. Nonzero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

22.9.7.23. `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- [mysql_num_fields\(\)](#)
- [mysql_fetch_field\(\)](#)

- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

See the Example in [Section 22.9.7.11, “`mysql_stmt_fetch\(\)`”](#).

22.9.7.24. `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

22.9.7.25. `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

22.9.7.26. mysql_stmt_send_long_data()

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)
```

Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 22.9.7.22, “mysql_stmt_reset\(\)”](#).

Return Values

Zero if the data is sent successfully to server. Nonzero if an error occurred.

Errors

- `CR_INVALID_BUFFER_USE`

The parameter does not have a string or binary type.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value '`MySQL - The most popular Open Source database`' into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO \
    test_long_data(text_column) VALUES(?)"
MYSQL_BIND bind[1];
long      length;
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
```

```

        fprintf(stderr, " mysql_stmt_init(), out of memory\n");
        exit(0);
    }
    if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
    {
        fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
        fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
        exit(0);
    }
    memset(bind, 0, sizeof(bind));
    bind[0].buffer_type= MYSQL_TYPE_STRING;
    bind[0].length= &length;
    bind[0].is_null= 0;

    /* Bind the buffers */
    if (mysql_stmt_bind_param(stmt, bind))
    {
        fprintf(stderr, "\n param bind failed");
        fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
        exit(0);
    }

    /* Supply data in chunks to server */
    if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
    {
        fprintf(stderr, "\n send_long_data failed");
        fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
        exit(0);
    }

    /* Supply the next piece of data */
    if (mysql_stmt_send_long_data(stmt,0,
        " - The most popular Open Source database",40))
    {
        fprintf(stderr, "\n send_long_data failed");
        fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
        exit(0);
    }

    /* Now, execute the query */
    if (mysql_stmt_execute(stmt))
    {
        fprintf(stderr, "\n mysql_stmt_execute failed");
        fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
        exit(0);
    }
}

```

22.9.7.27. `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. `"00000"` means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix C, Errors, Error Codes, and Common Problems](#).

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value `"HY000"` (general error) is used for unmapped errors.

Return Values

A null-terminated character string containing the SQLSTATE error code.

22.9.7.28. `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

Description

Result sets are produced by calling `mysql_stmt_execute()` to executed prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see [Section 22.9.7.11, “mysql_stmt_fetch\(\)”](#).)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set,

but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 22.9.7.23, “`mysql_stmt_result_metadata\(\)`”](#).

Note

MySQL doesn't by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications don't need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 22.9.7.3, “`mysql_stmt_attr_set\(\)`”](#).

Return Values

Zero if the results are buffered successfully. Nonzero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_OUT_OF_MEMORY](#)

Out of memory.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

22.9.8. C API Threaded Function Descriptions

To create a threaded client, use the functions described in the following sections. See also [Section 22.9.17.2, “How to Write a Threaded Client”](#).

22.9.8.1. `my_init()`

```
void my_init(void)
```

Description

`my_init()` initializes some global variables that MySQL needs. It also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access the prototype for `my_init()`, your program should include these header files:

```
#include <my_global.h>
#include <my_sys.h>
```

Return Values

None.

22.9.8.2. `mysql_thread_end()`

```
void mysql_thread_end(void)
```

Description

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

`mysql_thread_end()` is not invoked automatically by the client library. It must be called explicitly to avoid a memory leak.

Return Values

None.

22.9.8.3. `mysql_thread_init()`

```
my_bool mysql_thread_init(void)
```

Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: `mysql_thread_init()` is automatically called by `my_init()`, which itself is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` will be called for you.

Return Values

Zero if successful. Nonzero if an error occurred.

22.9.8.4. `mysql_thread_safe()`

```
unsigned int mysql_thread_safe(void)
```

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

22.9.9. C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See [Section 22.8, “libmysqld, the Embedded MySQL Server Library”](#). To write such an application, you must link it against the `libmysqld` library by using the `-lmysqld` flag rather than linking it against the `libmysqlclient` client library by using the `-lmysqlclient` flag. However, the calls to initialize and finalize the library are the same whether you write a client application or one that uses the embedded server: Call `mysql_library_init()` to initialize the library and `mysql_library_end()` when you are done with it. See [Section 22.9.2, “C API Function Overview”](#).

22.9.9.1. `mysql_server_init()`

```
int mysql_server_init(int argc, char **argv, char **groups)
```

Description

This function initializes the MySQL library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See [Section 22.9.3.40, “mysql_library_init\(\)”](#).

Return Values

Zero if successful. Nonzero if an error occurred.

22.9.9.2. `mysql_server_end()`

```
void mysql_server_end(void)
```

Description

This function finalizes the MySQL library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See [Section 22.9.3.39,](#)

```
mysql_library_end());
```

Return Values

None.

22.9.10. C API Client Plugin Functions

This section describes functions used for the client-side plugin API. They enable management of client plugins. For a description of the `struct st_mysql_client_plugin` structure used by these functions, see [Section 23.2.4.4, “Client Plugin API Data Structures”](#).

It is unlikely that a client program needs to call the functions in this section. Normally, the client causes a plugin to be loaded and used by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

22.9.10.1. mysql_client_find_plugin()

```
struct st_mysql_client_plugin *mysql_client_find_plugin(MYSQL *mysql, const char *name,
int type)
```

Description

Returns a pointer to a loaded plugin, loading the plugin first if necessary. An error occurs if the type is invalid or the plugin cannot be found or loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The plugin name.
- `type`: The plugin type.

This function was added in MySQL 5.5.7.

Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 22.9.3.15, “mysql_error\(\)”](#), and [Section 22.9.3.14, “mysql_errno\(\)”](#).

Example

```
MYSQL mysql;
struct st_mysql_client_plugin *p;

if ((p = mysql_client_find_plugin(&mysql, "myplugin",
                                  MYSQL_AUTHENTICATION_PLUGIN, 0)))
{
    printf("Plugin version: %d.%d.%d\n", p->version[0], p->version[1], p->version[2]);
}
```

22.9.10.2. mysql_client_register_plugin()

```
struct st_mysql_client_plugin *mysql_client_register_plugin(MYSQL *mysql, struct
st_mysql_client_plugin *plugin)
```

Description

Adds a plugin structure to the list of loaded plugins. An error occurs if the plugin is already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `plugin`: A pointer to the plugin structure.

This function was added in MySQL 5.5.7.

Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 22.9.3.15, “`mysql_error\(\)`”, and Section 22.9.3.14, “`mysql_errno\(\)`”](#).

22.9.10.3. `mysql_load_plugin()`

```
struct st_mysql_client_plugin *mysql_load_plugin(MYSQL *mysql, const char *name, int type, int argc, ...)
```

Description

Loads a MySQL client plugin, specified by name and type. An error occurs if the type is invalid or the plugin cannot be loaded.

It is not possible to load multiple plugins of the same type. An error occurs if you try to load a plugin of a type already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The name of the plugin to load.
- `type`: The type of plugin to load, or `-1` to disable type checking. If type is not `-1`, only plugins matching the type are considered for loading.
- `argc`: The number of following arguments (`0` if there are none). Interpretation of any following arguments depends on the plugin type.

This function was added in MySQL 5.5.7.

Another way to cause plugins to be loaded is to set the `LIBMYSQL_PLUGINS` environment variable to a semicolon-separated list of plugin names. For example:

```
shell> export LIBMYSQL_PLUGINS="myplugin1;myplugin2"
```

Plugins named by `LIBMYSQL_PLUGINS` are loaded when the client program calls `mysql_library_init()`. No error is reported if problems occur loading these plugins.

Return Values

A pointer to the plugin if it was loaded successfully. `NULL` if an error occurred.

Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 22.9.3.15, “`mysql_error\(\)`”, and Section 22.9.3.14, “`mysql_errno\(\)`”](#).

Example

```
MYSQL mysql;
if(!mysql_load_plugin(&mysql, "myplugin",
    MYSQL_AUTHENTICATION_PLUGIN, 0))
```

```
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    exit(-1);
}
```

See Also

See also [Section 22.9.10.3, “mysql_load_plugin\(\)”](#), [Section 22.9.3.15, “mysql_error\(\)”](#), [Section 22.9.3.14, “mysql_errno\(\)”](#).

22.9.10.4. mysql_load_plugin_v()

```
struct st_mysql_client_plugin *mysql_load_plugin_v(MYSQL *mysql, const char *name, int type, int argc, va_list args)
```

Description

This function is equivalent to `mysql_load_plugin()`, but it accepts a `va_list` instead of a variable list of parameters.

This function was added in MySQL 5.5.7.

See Also

See also [Section 22.9.10.3, “mysql_load_plugin\(\)”](#).

22.9.10.5. mysql_plugin_options()

```
int mysql_plugin_options(struct st_mysql_client_plugin *plugin, const char *option, const void *value)
```

Description

Passes an option type and value to a plugin. This function can be called multiple times to set several options. If the plugin does not have an option handler, an error occurs.

Specify the parameters as follows:

- `plugin`: A pointer to the plugin structure.
- `option`: The option to be set.
- `value`: A pointer to the option value.

This function was added in MySQL 5.5.7.

Return Values

Zero for success, 1 if an error occurred. If the plugin has an option handler, that handler should also return zero for success and 1 if an error occurred.

22.9.11. Common Questions and Problems When Using the C API

22.9.11.1. Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a nonempty result by calling `mysql_field_count()`. If

`mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a nonempty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

22.9.11.2. What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See [Section 22.9.3.37, “mysql_insert_id\(\)”](#).
- Some queries (`LOAD DATA INFILE ... , INSERT INTO ... SELECT ... , UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

22.9.11.3. How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a nonmagic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
  VALUES(NULL,'text');          # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
  VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

Note that `mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see [Section 11.14, “Information Functions”](#).
- For information on `mysql_insert_id()`, the function you use from within the C API, see [Section 22.9.3.37,](#)

```
mysql_insert_id());
```

- For information on obtaining the auto-incremented value when using Connector/J, see [Section 22.3.5, “Connector/J Notes and Tips”](#).
- For information on obtaining the auto-incremented value when using Connector/ODBC, see [Section 22.1.7.1.1, “Obtaining Auto-Increment Values”](#).

22.9.12. Controlling Automatic Reconnection Behavior

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. In this case, the library tries once to reconnect to the server and send the statement again.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure to disable auto-reconnect. This can be done explicitly by calling `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
my_bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

In MySQL 5.5, auto-reconnect is disabled by default.

If the connection has gone down, the `mysql_ping()` function performs a reconnect if auto-reconnect is enabled. If auto-reconnect is disabled, `mysql_ping()` returns an error instead.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset and your application will not know about it. The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session variables are reinitialized to the values of the corresponding variables. This also affects variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

22.9.13. C API Support for Multiple Statement Execution

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL 5.5 also supports the execution of a string containing multiple statements separated by semicolon (“`;`”) characters. This

capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling ` `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement. See [Section 22.9.4, “C API Prepared Statements”](#).

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
 - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`. As of MySQL 5.5.3, `CLIENT_MULTI_RESULTS` is enabled by default.
 - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to permit processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
```

```

    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
    exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
                      "DROP TABLE IF EXISTS test_table;\n"
                      "CREATE TABLE test_table(id INT);\n"
                      "INSERT INTO test_table VALUES(10);\n"
                      "UPDATE test_table SET id=20 WHERE id=10;\n"
                      "SELECT * FROM test_table;\n"
                      "DROP TABLE test_table");
if (status)
{
    printf("Could not execute statement(s)");
    mysql_close(mysql);
    exit(0);
}

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    }
    else          /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n",
                   mysql_affected_rows(mysql));
        }
        else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
    /* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
    if ((status = mysql_next_result(mysql)) > 0)
        printf("Could not execute statement\n");
} while (status == 0);

mysql_close(mysql);

```

22.9.14. C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example, from `DATE_FORMAT()`).
- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server doesn't print the leading zeros. (For example, with `MIN(number-with-zerofill)`).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Prepared statements use the query cache under the conditions described in [Section 7.9.3.1, “How the Query Cache Operates”](#).
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by “`;`” characters).
- Before MySQL 5.5.3, prepared `CALL` statements cannot invoke stored procedures that return result sets because prepared statements do not support multiple result sets. Nor can the calling application access a stored procedure's `OUT` or `INOUT` parameters when the procedure returns. As of MySQL 5.5.3, these capabilities are supported as described in [Section 22.9.16, “C API Support for Prepared CALL Statements”](#).

22.9.15. C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol enables you to send and receive date and time values (`DATE`, `TIME`, `DATETIME`, and `TIMESTAMP`), using the `MYSQL_TIME` structure. The members of this structure are described in [Section 22.9.5, “C API Prepared Statement Data Structures”](#).

To send temporal data values, create a prepared statement using `mysql_stmt_prepare()`. Then, before calling

`mysql_stmt_execute()` to execute the statement, use the following procedure to set up each temporal parameter:

1. In the `MYSQL_BIND` structure associated with the data value, set the `buffer_type` member to the type that indicates what kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.
2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the temporal value.
3. Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to be passed.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_stmt_bind_result()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handle.

```

MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
timestamp_field) VALUES(?, ?, ?);"

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, "mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...
mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
...

```

22.9.16. C API Support for Prepared `CALL` Statements

This section describes prepared-statement support in the C API for stored procedures executed using `CALL` statements:

Prior to MySQL 5.5.3, prepared `CALL` statements can be used only for stored procedures that produce at most one result set. Nor can the calling application use placeholders for `OUT` or `INOUT` parameters.

MySQL 5.5.3 expands support for stored procedures executed using prepared `CALL` statements in the following ways:

- A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.

- The final values of `OUT` and `INOUT` parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the `OUT` and `INOUT` parameters in the order in which they are declared in the procedure parameter list.

The following discussion shows how to use these capabilities through the C API for prepared statements. To use prepared `CALL` statements through the `PREPARE` and `EXECUTE` statements, see [Section 12.2.1, “`CALL` Syntax”](#).

If an application might be compiled or executed in a context where a version of MySQL older than 5.5.3 is used, prepared `CALL` capabilities for multiple result sets and `OUT` or `INOUT` parameters might not be available:

- For the client side, the application will not compile unless the libraries are from MySQL 5.5.3 or higher (the API function and symbols introduced in that version will not be present).
- To verify at runtime that the server is recent enough, a client can use this test:

```
if (mysql_get_server_version(mysql) < 50503)
{
    fprintf(stderr,
            "Server does not support required CALL capabilities\n");
    mysql_close(mysql);
    exit (1);
}
```

An application that executes a prepared `CALL` statement should use a loop that fetches a result and then invokes `mysql_stmt_next_result()` to determine whether there are more results. The results consist of any result sets produced by the stored procedure followed by a final status value that indicates whether the procedure terminated successfully.

If the procedure has `OUT` or `INOUT` parameters, the result set preceding the final status value contains their values. To determine whether a result set contains parameter values, test whether the `SERVER_PS_OUT_PARAMS` bit is set in the `server_status` member of the `MYSQL` connection handler:

```
mysql->server_status & SERVER_PS_OUT_PARAMS
```

The following example uses a prepared `CALL` statement to execute a stored procedure that produces multiple result sets and that provides parameter values back to the caller by means of `OUT` and `INOUT` parameters. The procedure takes parameters of all three types (`IN`, `OUT`, `INOUT`), displays their initial values, assigns new values, displays the updated values, and returns. The expected return information from the procedure therefore consists of multiple result sets and a final status:

- One result set containing the initial parameter values: `10, NULL, 30`. (The `OUT` parameter is assigned a value by the caller, but this assignment is expected to be ineffective: `OUT` parameters are seen as `NULL` within a procedure until assigned a value within the procedure.)
- One result set containing the modified parameter values: `100, 200, 300`.
- One result set containing the final `OUT` and `INOUT` parameter values: `200, 300`.
- A final status packet.

The code to execute the procedure:

```
MYSQL_STMT *stmt;
MYSQL_BIND ps_params[3]; /* input parameter buffers */
int        int_data[3];  /* input parameter values */
my_bool   is_null[3];   /* input parameter nullability */
int        status;

/* set up stored procedure */
status = mysql_query(mysql, "DROP PROCEDURE IF EXISTS p1");
test_error(mysql, status);

status = mysql_query(mysql,
    "CREATE PROCEDURE p1("
    "    IN p_in INT, "
    "    OUT p_out INT, "
    "    INOUT p_inout INT) "
    "BEGIN "
    "    SELECT p_in, p_out, p_inout; "
    "    SET p_in = 100, p_out = 200, p_inout = 300; "
    "    SELECT p_in, p_out, p_inout; "
    "END");
test_error(mysql, status);

/* initialize and prepare CALL statement with parameter placeholders */
```

```

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    printf("Could not initialize statement\n");
    exit(1);
}
status = mysql_stmt_prepare(stmt, "CALL pl(?, ?, ?)", 16);
test_stmt_error(stmt, status);

/* initialize parameters: p_in, p_out, p_inout (all INT) */
memset(ps_params, 0, sizeof (ps_params));

ps_params[0].buffer_type = MYSQL_TYPE_LONG;
ps_params[0].buffer = (char *) &int_data[0];
ps_params[0].length = 0;
ps_params[0].is_null = 0;

ps_params[1].buffer_type = MYSQL_TYPE_LONG;
ps_params[1].buffer = (char *) &int_data[1];
ps_params[1].length = 0;
ps_params[1].is_null = 0;

ps_params[2].buffer_type = MYSQL_TYPE_LONG;
ps_params[2].buffer = (char *) &int_data[2];
ps_params[2].length = 0;
ps_params[2].is_null = 0;

/* bind parameters */
status = mysql_stmt_bind_param(stmt, ps_params);
test_stmt_error(stmt, status);

/* assign values to parameters and execute statement */
int_data[0]= 10; /* p_in */
int_data[1]= 20; /* p_inout */
int_data[2]= 30; /* p_inout */

status = mysql_stmt_execute(stmt);
test_stmt_error(stmt, status);

/* process results until there are no more */
do {
    int i;
    int num_fields; /* number of columns in result */
    MySQL_FIELD *fields; /* for result set metadata */
    MySQL_BIND *rs_bind; /* for output buffers */

    /* the column count is > 0 if there is a result set */
    /* 0 if the result is only the final status packet */
    num_fields = mysql_stmt_field_count(stmt);

    if (num_fields > 0)
    {
        /* there is a result set to fetch */
        printf("Number of columns in result: %d\n", (int) num_fields);

        /* what kind of result set is this? */
        printf("Data: ");
        if(mysql->server_status & SERVER_PS_OUT_PARAMS)
            printf("this result set contains OUT/INOUT parameters\n");
        else
            printf("this result set is produced by the procedure\n");

        MySQL_RES *rs_metadata = mysql_stmt_result_metadata(stmt);
        test_stmt_error(stmt, rs_metadata == NULL);

        fields = mysql_fetch_fields(rs_metadata);

        rs_bind = (MySQL_BIND *) malloc(sizeof (MySQL_BIND) * num_fields);
        if (!rs_bind)
        {
            printf("Cannot allocate output buffers\n");
            exit(1);
        }
        memset(rs_bind, 0, sizeof (MySQL_BIND) * num_fields);

        /* set up and bind result set output buffers */
        for (i = 0; i < num_fields; ++i)
        {
            rs_bind[i].buffer_type = fields[i].type;
            rs_bind[i].is_null = &is_null[i];

            switch (fields[i].type)
            {
                case MYSQL_TYPE_LONG:
                    rs_bind[i].buffer = (char *) &(int_data[i]);
                    rs_bind[i].buffer_length = sizeof (int_data);
                    break;

                default:
                    fprintf(stderr, "ERROR: unexpected type: %d.\n", fields[i].type);
                    exit(1);
            }
        }

        status = mysql_stmt_bind_result(stmt, rs_bind);
        test_stmt_error(stmt, status);
    }
}

```

```

/* fetch and display result set rows */
while (1)
{
    status = mysql_stmt_fetch(stmt);

    if (status == 1 || status == MYSQL_NO_DATA)
        break;

    for (i = 0; i < num_fields; ++i)
    {
        switch (rs_bind[i].buffer_type)
        {
            case MYSQL_TYPE_LONG:
                if (*rs_bind[i].is_null)
                    printf(" val[%d] = NULL;", i);
                else
                    printf(" val[%d] = %ld;",
                           i, (long) *((int *) rs_bind[i].buffer));
                break;

            default:
                printf(" unexpected type (%d)\n",
                       rs_bind[i].buffer_type);
        }
    }
    printf("\n");

    mysql_free_result(rs_metadata); /* free metadata */
    free(rs_bind); /* free output buffers */
}
else
{
    /* no columns = final status packet */
    printf("End of procedure output\n");
}

/* more results? -1 = no, >0 = error, 0 = yes (keep looking) */
status = mysql_stmt_next_result(stmt);
if (status > 0)
    test_stmt_error(stmt, status);
} while (status == 0);

mysql_stmt_close(stmt);

```

Execution of the procedure should produce the following output:

```

Number of columns in result: 3
Data: this result set is produced by the procedure
      val[0] = 10; val[1] = NULL; val[2] = 30;
Number of columns in result: 3
Data: this result set is produced by the procedure
      val[0] = 100; val[1] = 200; val[2] = 300;
Number of columns in result: 2
Data: this result set contains OUT/INOUT parameters
      val[0] = 200; val[1] = 300;
End of procedure output

```

The code uses two utility routines, `test_error()` `test_stmt_error()`, to check for errors and terminate after printing diagnostic information if an error occurred:

```

static void test_error(MYSQL *mysql, int status)
{
    if (status)
    {
        printf("Error: %s (errno: %d)\n",
               mysql_error(mysql), mysql_errno(mysql));
        exit(1);
    }
}

static void test_stmt_error(MYSQL_STMT *stmt, int status)
{
    if (status)
    {
        printf("Error: %s (errno: %d)\n",
               mysql_stmt_error(stmt), mysql_stmt_errno(stmt));
        exit(1);
    }
}

```

22.9.17. Building Client Programs

If you compile MySQL clients that you've written yourself or that you obtain from a third-party, they must be linked using the `-lmysqlclient -lz` options in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use `-L/usr/local/mysql/lib -lmysqlclient -lz` in the link command.

For clients that use MySQL header files, you may need to specify an `-I` option when you compile them (for example, `-I/usr/local/mysql/include`), so that the compiler can find the header files.

Compiling MySQL Clients on Unix

To make it simpler to compile MySQL programs on Unix, we have provided the `mysql_config` script for you. See [Section 4.7.2, “`mysql_config` — Get Compile Options for Compiling Clients”](#).

You can use it to compile a MySQL client as follows:

```
CFG=/usr/local/mysql/bin/mysql_config
sh -c "gcc -o programe `$CFG --cflags` programe.c `$CFG --libs`"
```

The `sh -c` is needed to get the shell not to treat the output from `mysql_config` as one word.

Compiling MySQL Clients on Microsoft Windows

On Windows, you can link your code with either the dynamic or static client library. The static library is named `mysqlclient` and the dynamic library is named `libmysql`.

If you link with the static library, failure can occur if certain conditions are not satisfied:

- The client application must be compiled with exactly the same version of Visual Studio as that used to compile the library.
- The client application should link the C runtime statically by using the `/MT` compiler option.

If the client application is built in in debug mode and uses the static debug C runtime (`/MTd` compiler option), it can link the `mysqlclient` if that library was built using the same option. If the client application uses the dynamic C runtime (`/MD` option, or `/MDd` option in debug mode), it cannot link with the static client library and must use the dynamic library.

The MSDN page describing the link options can be found here: <http://msdn.microsoft.com/en-us/library/2kzt1wy3.aspx>

22.9.17.1. Problems Linking to the MySQL Client Library

When linking with the C API, the following errors may occur on some systems:

```
gcc -g -o client test.o -L/usr/local/lib/mysql \
-lmysqlclient -lsocket -lnsl

Undefined          first referenced
symbol            in file
floor             /usr/local/lib/mysql/libmysqlclient.a(password.o)
ld: fatal: Symbol referencing errors. No output written to client
```

If this happens on your system, you must include the math library by adding `-lm` to the end of the compile/link line.

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.9, “Installing MySQL from Source”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

22.9.17.2. How to Write a Threaded Client

The client library is almost thread-safe. The biggest problem is that the subroutines in `net.c` that read from sockets are not interrupt safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, the socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. If you want to use your own `SIGPIPE` handler, you should first call `mysql_library_init()` and then install your handler.

If “undefined symbol” errors occur when linking against the `libmysqlclient` client library, in most cases this is because you have not included the thread libraries on the link/compile command.

The client library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Two threads can't send a query to the MySQL server at the same time on the same connection. In particular, you have to ensure that between calls to `mysql_query()` and `mysql_store_result()` no other thread is using the same connection.
- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- If you use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.
- If you want to use multiple threads on the same connection, you must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. Once `mysql_store_result()` is ready, the lock can be released and other threads may query the same connection.
- If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

You need to know the following if you have a thread that did not create the connection to the MySQL database but is calling MySQL functions:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To avoid problems, you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.
2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, it will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

22.10. MySQL PHP API

PHP is a server-side, HTML-embedded scripting language that may be used to create dynamic Web pages. It is available for most operating systems and Web servers, and can access most common databases, including MySQL. PHP may be run as a separate program or compiled as a module for use with the Apache Web server.

PHP actually provides two different MySQL API extensions:

- `mysql`: Available for PHP versions 4 and 5, this extension is intended for use with MySQL versions prior to MySQL 4.1. This extension does not support the improved authentication protocol used in MySQL 4.1, nor does it support prepared statements or multiple statements. If you wish to use this extension with MySQL 4.1, you will likely want to configure the MySQL server to use the `--old-passwords` option (see [Section C.5.2.4, “Client does not support authentication protocol”](#)). This extension is documented on the PHP Web site at <http://php.net/mysql>.
- [Section 22.10.2, “MySQL Improved Extension \(`mysqli`\)”](#) - Stands for “MySQL, Improved”; this extension is available only in PHP 5. It is intended for use with MySQL 4.1.1 and later. This extension fully supports the authentication protocol used in MySQL 5.0, as well as the Prepared Statements and Multiple Statements APIs. In addition, this extension provides an advanced, object-oriented programming interface. You can read the documentation for the `mysqli` extension at <http://php.net/mysqli>. Helpful article can be found at <http://devzone.zend.com/node/view/id/686> and <http://devzone.zend.com/node/view/id/687>.

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, see [Section 22.10.7, “Enabling Both `mysql` and `mysqli` in PHP”](#).

The PHP distribution and documentation are available from the [PHP Web site](#).

Portions of this section are Copyright (c) 1997-2008 the PHP Documentation Group This material may be distributed only subject to the terms and conditions set forth in the Creative Commons Attribution 3.0 License or later. 22.10.1. MySQL

[Copyright 1997-2010 the PHP Documentation Group](#).

These functions allow you to access MySQL database servers. More information about MySQL can be found at <http://www.mysql.com/>.

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

For an overview of MySQL database connectivity terms and products see [Section 22.10.2.2, “Overview”](#).

22.10.1.1. Installing/Configuring

[Copyright 1997-2010 the PHP Documentation Group](#).

22.10.1.1.1. Requirements

[Copyright 1997-2010 the PHP Documentation Group](#).

In order to have these functions available, you must compile PHP with MySQL support.

22.10.1.1.2. Installation

[Copyright 1997-2010 the PHP Documentation Group](#).

For compiling, simply use the `--with-mysql[=DIR]` configuration option where the optional `[DIR]` points to the MySQL installation directory.

Although this MySQL extension is compatible with MySQL 4.1.0 and greater, it doesn't support the extra functionality that these versions provide. For that, use the `MySQLi` extension.

If you would like to install the `mysql` extension along with the `mysqli` extension you have to use the same client library to avoid any conflicts.

22.10.1.1.2.1.1. Installation on Linux Systems

Copyright 1997-2010 the PHP Documentation Group.

22.10.1.1.2.1.1.1. PHP 4

Copyright 1997-2010 the PHP Documentation Group.

The option `--with-mysql` is enabled by default. This default behavior may be disabled with the `--without-mysql` configuration option. If MySQL is enabled without specifying the path to the MySQL install DIR, PHP will use the bundled MySQL client libraries.

Users who run other applications that use MySQL (for example, `auth-mysql`) should not use the bundled library, but rather specify the path to MySQL's install directory, like so: `--with-mysql=/path/to/mysql`. This will force PHP to use the client libraries installed by MySQL, thus avoiding any conflicts.

22.10.1.1.2.1.2. PHP 5.0.x, 5.1.x, 5.2.x

Copyright 1997-2010 the PHP Documentation Group.

MySQL is not enabled by default, nor is the MySQL library bundled with PHP. Read this [FAQ](#) for details on why. Use the `-with-mysql[=DIR]` configure option to include MySQL support. You can download *headers and libraries* from <http://www.mysql.com/>.

22.10.1.1.2.1.3. PHP 5.3.0+

Copyright 1997-2010 the PHP Documentation Group.

In PHP 5.3.0 and above the MySQL-related database extensions use the [MySQL Native Driver](#) by default. This means that the MySQL Client Library (`libmysql`) is no longer required in order to support connection to a MySQL database. The extensions `mysql`, `mysqli`, and `PHP_PDO_MYSQL` are all enabled by default in PHP 5.3.0+, and all use the MySQL Native Driver by default. In each case no further installation steps are required in order to use these extensions, although you may want to set some preferences in `php.ini` depending on your requirements.

22.10.1.1.2.2. Installation on Windows Systems

Copyright 1997-2010 the PHP Documentation Group.

22.10.1.1.2.2.1. PHP 4

Copyright 1997-2010 the PHP Documentation Group.

The PHP MySQL extension is compiled into PHP.

22.10.1.1.2.2.2. PHP 5.0.x, 5.1.x, 5.2.x

Copyright 1997-2010 the PHP Documentation Group.

MySQL is no longer enabled by default, so the `php_mysql.dll` DLL must be enabled inside of `php.ini`. Also, PHP needs access to the MySQL client library. A file named `libmysql.dll` is included in the Windows PHP distribution and in order for PHP to talk to MySQL this file needs to be available to the Windows system's `PATH`. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Although copying `libmysql.dll` to the Windows system directory also works (because the system directory is by default in the system's `PATH`), it's not recommended.

As with enabling any PHP extension (such as `php_mysql.dll`), the PHP directive `extension_dir` should be set to the directory where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`

Note

If when starting the web server an error similar to the following occurs: `"Unable to load dynamic library '.../php_mysql.dll'",` this is because `php_mysql.dll` and/or `libmysql.dll` cannot be found by the system.

22.10.1.1.2.2.3. PHP 5.3.0+

Copyright 1997-2010 the PHP Documentation Group.

Please refer to [these notes](#) on installing MySQL support on PHP 5.3.0 and above.

22.10.1.1.2.3. MySQL Installation Notes

Copyright 1997-2010 the PHP Documentation Group.

Warning

Crashes and startup problems of PHP may be encountered when loading this extension in conjunction with the recode extension. See the [recode](#) extension for more information.

Note

If you need charsets other than *latin* (default), you have to install external (not bundled) libmysql with compiled charset support.

22.10.1.1.3. Runtime Configuration

Copyright 1997-2010 the PHP Documentation Group.

The behaviour of these functions is affected by settings in [php.ini](#).

Table 22.5. MySQL Configuration Options

Name	Default	Changeable	Changelog
<code>mysql.allow_persistent</code>	"1"	PHP_INI_SYSTEM	
<code>mysql.max_persistent</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.max_links</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.trace_mode</code>	"0"	PHP_INI_ALL	Available since PHP 4.3.0.
<code>mysql.default_port</code>	NULL	PHP_INI_ALL	
<code>mysql.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 4.0.1.
<code>mysql.default_host</code>	NULL	PHP_INI_ALL	
<code>mysql.default_user</code>	NULL	PHP_INI_ALL	
<code>mysql.default_password</code>	NULL	PHP_INI_ALL	
<code>mysql.connect_timeout</code>	"60"	PHP_INI_ALL	PHP_INI_SYSTEM in PHP <= 4.3.2. Available since PHP 4.3.0.

For further details and definitions of the PHP_INI_* modes, see the [configuration.changes.modes](#).

Here's a short explanation of the configuration directives.

<code>mysql.allow_persistent</code>	Whether to allow persistent connections to MySQL.
<code>mysql.max_persistent</code>	The maximum number of persistent MySQL connections per process.
<code>mysql.max_links</code>	The maximum number of MySQL connections per process, including persistent connections.
<code>mysql.trace_mode</code>	Trace mode. When <code>mysql.trace_mode</code> is enabled, warnings for table/index scans, non free result sets, and SQL-Errors will be displayed. (Introduced in PHP 4.3.0)
<code>mysql.default_port</code>	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time <code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.
<code>mysql.default_socket</code>	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysql.default_host</code>	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in SQL safe mode .
<code>mysql.default_user</code>	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in SQL safe mode .

<code>mysql.default_password</code> string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in SQL safe mode .
<code>mysql.connect_timeout</code> integer	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.

22.10.1.1.4. Resource Types

[Copyright 1997-2010 the PHP Documentation Group](#).

There are two resource types used in the MySQL module. The first one is the link identifier for a database connection, the second a resource which holds the result of a query.

22.10.1.2. Predefined Constants

[Copyright 1997-2010 the PHP Documentation Group](#).

The constants below are defined by this extension, and will only be available when the extension has either been compiled into PHP or dynamically loaded at runtime.

Since PHP 4.3.0 it is possible to specify additional client flags for the `mysql_connect` and `mysql_pconnect` functions. The following constants are defined:

Table 22.6. MySQL client constants

Constant	Description
<code>MYSQL_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQL_CLIENT_IGNORE_SPACE</code>	Allow space after function names
<code>MYSQL_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code>) of inactivity before closing the connection.
<code>MYSQL_CLIENT_SSL</code>	Use SSL encryption. This flag is only available with version 4.x of the MySQL client library or newer. Version 3.23.x is bundled both with PHP 4 and Windows binaries of PHP 5.

The function `mysql_fetch_array` uses a constant for the different types of result arrays. The following constants are defined:

Table 22.7. MySQL fetch constants

Constant	Description
<code>MYSQL_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQL_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the array index.
<code>MYSQL_NUM</code>	Columns are returned into the array having a numerical index to the fields. This index starts with 0, the first field in the result.

22.10.1.3. Examples

[Copyright 1997-2010 the PHP Documentation Group](#).

22.10.1.3.1. Basic

This simple example shows how to connect, execute a query, print resulting rows and disconnect from a MySQL database.

Example 22.15. MySQL extension overview example

[Copyright 1997-2010 the PHP Documentation Group](#).

```
<?php
// Connecting, selecting database
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
```

```

    or die('Could not connect: ' . mysql_error());
echo 'Connected successfully';
mysql_select_db('my_database') or die('Could not select database');

// Performing SQL query
$query = 'SELECT * FROM my_table';
$result = mysql_query($query) or die('Query failed: ' . mysql_error());

// Printing results in HTML
echo "<table>\n";
while ($line = mysql_fetch_array($result, MYSQL_ASSOC)) {
    echo "\t<tr>\n";
    foreach ($line as $col_value) {
        echo "\t\t<td>$col_value</td>\n";
    }
    echo "\t</tr>\n";
}
echo "</table>\n";

// Free resultset
mysql_free_result($result);

// Closing connection
mysql_close($link);
?>

```

22.10.1.4. MySQL Functions

Copyright 1997-2010 the PHP Documentation Group.

Note

Most MySQL functions accept *link_identifier* as the last optional parameter. If it is not provided, last opened connection is used. If it doesn't exist, connection is tried to establish with default parameters defined in `php.ini`. If it is not successful, functions return `FALSE`.

22.10.1.4.1. `mysql_affected_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_affected_rows`

Get number of affected rows in previous MySQL operation

Description

```
int mysql_affected_rows(resource link_identifier);
```

Get the number of affected rows by the last INSERT, UPDATE, REPLACE or DELETE query associated with *link_identifier*.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the number of affected rows on success, and -1 if the last query failed.

If the last query was a DELETE query with no WHERE clause, all of the records will have been deleted from the table but this function will return zero with MySQL versions prior to 4.1.2.

When using UPDATE, MySQL will not update columns where the new value is the same as the old value. This creates the possibility that `mysql_affected_rows` may not actually equal the number of rows matched, only the number of rows that were literally affected by the query.

The REPLACE statement first deletes the record with the same primary key and then inserts the new record. This function returns the number of deleted records plus the number of inserted records.

Examples

Example 22.16. `mysql_affected_rows` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* this should return the correct numbers of deleted records */
mysql_query('DELETE FROM mytable WHERE id < 10');
printf("Records deleted: %d\n", mysql_affected_rows());

/* with a where clause that is never true, it should return 0 */
mysql_query('DELETE FROM mytable WHERE 0');
printf("Records deleted: %d\n", mysql_affected_rows());
?>
```

The above example will output something similar to:

```
Records deleted: 10
Records deleted: 0
```

Example 22.17. `mysql_affected_rows` example using transactions

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* Update records */
mysql_query("UPDATE mytable SET used=1 WHERE id < 10");
printf ("Updated records: %d\n", mysql_affected_rows());
mysql_query("COMMIT");
?>
```

The above example will output something similar to:

```
Updated Records: 10
```

Notes

Transactions

If you are using transactions, you need to call `mysql_affected_rows` after your INSERT, UPDATE, or DELETE query, not after the COMMIT.

SELECT Statements

To retrieve the number of rows returned by a SELECT, it is possible to use `mysql_num_rows`.

Cascaded Foreign Keys

`mysql_affected_rows` does not count rows affected implicitly through the use of ON DELETE CASCADE and/or ON UPDATE CASCADE in foreign key constraints.

See Also

`mysql_num_rows`
`mysql_info`

22.10.1.4.2. `mysql_client_encoding`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_client_encoding`

Returns the name of the character set

Description

```
string mysql_client_encoding(resource link_identifier);
```

Retrieves the `character_set` variable from MySQL.

Parameters

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the default character set name for the current connection.

Examples

Example 22.18. `mysql_client_encoding` example

```
<?php
$link    = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$charset = mysql_client_encoding($link);
echo "The current character set is: $charset\n";
?>
```

The above example will output something similar to:

```
The current character set is: latin1
```

See Also

`mysql_set_charset`

```
mysql_real_escape_string
```

22.10.1.4.3. mysql_close

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_close](#)

Close MySQL connection

Description

```
bool mysql_close(resource link_identifier);
```

[mysql_close](#) closes the non-persistent connection to the MySQL server that's associated with the specified link identifier. If *link_identifier* isn't specified, the last opened link is used.

Using [mysql_close](#) isn't usually necessary, as non-persistent open links are automatically closed at the end of the script's execution. See also [freeing resources](#).

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 22.19. mysql_close example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

The above example will output:

```
Connected successfully
```

Notes

Note

[mysql_close](#) will not close persistent links created by [mysql_pconnect](#).

[mysql_connect](#)

```
mysql_free_result
```

22.10.1.4.4. mysql_connect

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_connect](#)

Open a connection to a MySQL Server

Description

```
resource mysql_connect(string server= ini_get("mysql.default_host"),
                      string username= ini_get("mysql.default_user"),
                      string password= ini_get("mysql.default_password"),
                      bool new_link= false,
                      int client_flags= 0);
```

Opens or reuses a connection to a MySQL server.

Parameters

server

The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost.

If the PHP directive `mysql.default_host` is undefined (default), then the default value is 'localhost:3306'. In [SQL safe mode](#), this parameter is ignored and value 'localhost:3306' is always used.

username

The username. Default value is defined by `mysql.default_user`. In [SQL safe mode](#), this parameter is ignored and the name of the user that owns the server process is used.

password

The password. Default value is defined by `mysql.default_password`. In [SQL safe mode](#), this parameter is ignored and empty password is used.

new_link

If a second call is made to `mysql_connect` with the same arguments, no new link will be established, but instead, the link identifier of the already opened link will be returned. The `new_link` parameter modifies this behavior and makes `mysql_connect` always open a new link, even if `mysql_connect` was called before with the same parameters. In [SQL safe mode](#), this parameter is ignored.

client_flags

The `client_flags` parameter can be a combination of the following constants: 128 (enable `LOAD DATA LOCAL` handling), `MYSQL_CLIENT_SSL`, `MYSQL_CLIENT_COMPRESS`, `MYSQL_CLIENT_IGNORE_SPACE` or `MYSQL_CLIENT_INTERACTIVE`. Read the section about [Table 22.6, “MySQL client constants”](#) for further information. In [SQL safe mode](#), this parameter is ignored.

Return Values

Returns a MySQL link identifier on success or `FALSE` on failure.

Changelog

Version	Description
4.3.0	Added the <code>client_flags</code> parameter.
4.2.0	Added the <code>new_link</code> parameter.

Examples

Example 22.20. mysql_connect example

```
<?php
```

```

$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>

```

Example 22.21. `mysql_connect` example using `hostname:port` syntax

```

<?php
// we connect to example.com and port 3307
$link = mysql_connect('example.com:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// we connect to localhost at port 3307
$link = mysql_connect('127.0.0.1:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>

```

Example 22.22. `mysql_connect` example using "`:/path/to/socket`" syntax

```

<?php
// we connect to localhost and socket e.g. /tmp/mysql.sock

//variant 1: ommit localhost
$link = mysql_connect('/:tmp/mysql', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// variant 2: with localhost
$link = mysql_connect('localhost:/tmp/mysql.sock', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>

```

Notes

Note

Whenever you specify "localhost" or "localhost:port" as server, the MySQL client library will override this and try to connect to a local socket (named pipe on Windows). If you want to use TCP/IP, use "127.0.0.1" instead of "localhost". If the MySQL client library tries to connect to the wrong local socket, you should set the correct path as `mysql.default_host` string in your PHP configuration and leave the server field blank.

Note

The link to the server will be closed as soon as the execution of the script ends, unless it's closed earlier by explicitly calling `mysql_close`.

Note

You can suppress the error message on failure by prepending a `@` to the function name.

Note

Error "Can't create TCP/IP socket (10106)" usually means that the `variables_order` configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

`mysql_close`

22.10.1.4.5. `mysql_create_db`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_create_db`

Create a MySQL database

Description

```
bool mysql_create_db(string database_name,
                      resource link_identifier);
```

`mysql_create_db` attempts to create a new database on the server associated with the specified link identifier.

Parameters

`database_name`

The name of the database being created.

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.23. `mysql_create_db` alternative example

The function `mysql_create_db` is deprecated. It is preferable to use `mysql_query` to issue an sql `CREATE DATABASE` statement instead.

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'CREATE DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db created successfully\n";
} else {
    echo 'Error creating database: ' . mysql_error() . "\n";
}
?>
```

The above example will output something similar to:

```
Database my_db created successfully
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_createdb`

Note

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

See Also

`mysql_query`
`mysql_select_db`

22.10.1.4.6. mysql_data_seek

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_data_seek`

Move internal result pointer

Description

```
bool mysql_data_seek(resource result,
                      int row_number);
```

`mysql_data_seek` moves the internal row pointer of the MySQL result associated with the specified result identifier to point to the specified row number. The next call to a MySQL fetch function, such as `mysql_fetch_assoc`, would return that row.

`row_number` starts at 0. The `row_number` should be a value in the range from 0 to `mysql_num_rows` - 1. However if the result set is empty (`mysql_num_rows == 0`), a seek to 0 will fail with a `E_WARNING` and `mysql_data_seek` will return `FALSE`.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`row_number` The desired row number of the new result pointer.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 22.24. mysql_data_seek example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
$db_selected = mysql_select_db('sample_db');
if (!$db_selected) {
    die('Could not select database: ' . mysql_error());
```

```

}
$query = 'SELECT last_name, first_name FROM friends';
$result = mysql_query($query);
if (!$result) {
    die('Query failed: ' . mysql_error());
}
/* fetch rows in reverse order */
for ($i = mysql_num_rows($result) - 1; $i >= 0; $i--) {
    if (!mysql_data_seek($result, $i)) {
        echo "Cannot seek to row $i: " . mysql_error() . "\n";
        continue;
    }
    if (!$row = mysql_fetch_assoc($result)) {
        continue;
    }
    echo $row['last_name'] . ' ' . $row['first_name'] . "<br />\n";
}
mysql_free_result($result);
?>

```

Notes

Note

The function `mysql_data_seek` can be used in conjunction only with `mysql_query`, not with `mysql_unbuffered_query`.

22.10.1.4.7. `mysql_db_name`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_db_name](#)
Get result data

Description

```
string mysql_db_name(resource result,
                      int row,
                      mixed field);
```

Retrieve the database name from a call to `mysql_list_dbs`.

Parameters

<code>result</code>	The result pointer from a call to <code>mysql_list_dbs</code> .
<code>row</code>	The index into the result set.
<code>field</code>	The field name.

Return Values

Returns the database name on success, and `FALSE` on failure. If `FALSE` is returned, use `mysql_error` to determine the nature of the error.

Examples

Example 22.25. `mysql_db_name` example

```
<?php
error_reporting(E_ALL);

$link = mysql_connect('dbhost', 'username', 'password');
$db_list = mysql_list_dbs($link);

$i = 0;
$cnt = mysql_num_rows($db_list);
while ($i < $cnt) {
    echo mysql_db_name($db_list, $i) . "\n";
    $i++;
}
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_dbname`

See Also

[mysql_list_dbs](#)
[mysql_tablename](#)

22.10.1.4.8. `mysql_db_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_db_query](#)

Send a MySQL query

Description

```
resource mysql_db_query(string database,
                        string query,
                        resource link_identifier);
```

`mysql_db_query` selects a database, and executes a query on it.

Warning

This function has been *DEPRECATED* as of PHP 5.3.0. Relying on this feature is highly discouraged.

Parameters

`database`

The name of the database that will be selected.

`query`

The MySQL query.

Data inside the query should be [properly escaped](#).

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a positive MySQL result resource to the query result, or `FALSE` on error. The function also returns `TRUE / FALSE` for `INSERT/UPDATE/DELETE` queries to indicate success/failure.

Changelog

Version	Description
5.3.0	This function now throws an <code>E_DEPRECATED</code> notice.
4.0.6	This function is deprecated, do not use this function. Use <code>mysql_select_db</code> and <code>mysql_query</code> instead.

Examples

Example 22.26. `mysql_db_query` alternative example

```
<?php
if (!$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

if (!mysql_select_db('mysql_dbname', $link)) {
    echo 'Could not select database';
    exit;
}

$sql    = 'SELECT foo FROM bar WHERE id = 42';
$result = mysql_query($sql, $link);

if (!$result) {
    echo "DB Error, could not query the database\n";
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_assoc($result)) {
    echo $row['foo'];
}

mysql_free_result($result);
?>
```

Notes

Note

Be aware that this function does *NOT* switch back to the database you were connected before. In other words, you can't use this function to *temporarily* run a sql query on another database, you would have to manually switch back. Users are strongly encouraged to use the `database.table` syntax in their sql queries or `mysql_select_db` instead of this function.

See Also

[mysql_select_db](#)

22.10.1.4.9. `mysql_drop_db`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_drop_db](#)

Drop (delete) a MySQL database

Description

```
bool mysql_drop_db(string database_name,
                   resource link_identifier);
```

`mysql_drop_db` attempts to drop (remove) an entire database from the server associated with the specified link identifier. This function is deprecated, it is preferable to use `mysql_query` to issue an sql `DROP DATABASE` statement instead.

Parameters

`database_name`

The name of the database that will be deleted.

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.27. `mysql_drop_db` alternative example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'DROP DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db was successfully dropped\n";
} else {
    echo 'Error dropping database: ' . mysql_error() . "\n";
}
?>
```

Notes

Warning

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_dropdb`

See Also

[mysql_query](#)

22.10.1.4.10. `mysql_errno`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_errno](#)

Returns the numerical value of the error message from previous MySQL operation

Description

```
int mysql_errno(resource link_identifier);
```

Returns the error number from the last MySQL function.

Errors coming back from the MySQL database backend no longer issue warnings. Instead, use `mysql_errno` to retrieve the error code. Note that this function only returns the error code from the most recently executed MySQL function (not including `mysql_error` and `mysql_errno`), so if you want to use it, make sure you check the value before calling another MySQL function.

Parameters

<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If no connection is found or established, an <code>E_WARNING</code> level error is generated.
------------------------------	--

Return Values

Returns the error number from the last MySQL function, or `0` (zero) if no error occurred.

Examples

Example 22.28. `mysql_errno` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");

if (!mysql_select_db("nonexistentdb", $link)) {
    echo mysql_errno($link) . ":" . mysql_error($link). "\n";
}

mysql_select_db("kossu", $link);
if (!mysql_query("SELECT * FROM nonexistenttable", $link)) {
    echo mysql_errno($link) . ":" . mysql_error($link) . "\n";
}
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

See Also

[mysql_error](#)
[MySQL error codes](#)

22.10.1.4.11. `mysql_error`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_error](#)

Returns the text of the error message from previous MySQL operation

Description

```
string mysql_error(resource link_identifier);
```

Returns the error text from the last MySQL function. Errors coming back from the MySQL database backend no longer issue warnings. Instead, use `mysql_error` to retrieve the error text. Note that this function only returns the error text from the most recently executed MySQL function (not including `mysql_error` and `mysql_errno`), so if you want to use it, make sure you check the value before calling another MySQL function.

Parameters

<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If no connection is found or established, an <code>E_WARNING</code> level error is generated.
------------------------------	--

Return Values

Returns the error text from the last MySQL function, or `''` (empty string) if no error occurred.

Examples

Example 22.29. `mysql_error` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");
mysql_select_db("nonexistentdb", $link);
echo mysql_errno($link) . ":" . mysql_error($link) . "\n";
mysql_select_db("kossu", $link);
mysql_query("SELECT * FROM nonexistenttable", $link);
echo mysql_errno($link) . ":" . mysql_error($link) . "\n";
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

[MySQL error codes](#)

22.10.1.4.12. `mysql_escape_string`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_escape_string`

Escapes a string for use in a `mysql_query`

Description

```
string mysql_escape_string(string unescaped_string);
```

This function will escape the `unescaped_string`, so that it is safe to place it in a `mysql_query`. This function is deprecated.

This function is identical to `mysql_real_escape_string` except that `mysql_real_escape_string` takes a connection handler and escapes the string according to the current character set. `mysql_escape_string` does not take a connection argu-

ment and does not respect the current charset setting.

Warning

This function has been *DEPRECATED* as of PHP 5.3.0. Relying on this feature is highly discouraged.

Parameters

<code>unespaced_string</code>	The string that is to be escaped.
-------------------------------	-----------------------------------

Return Values

Returns the escaped string.

Changelog

Version	Description
5.3.0	This function now throws an E_DEPRECATED notice.
4.3.0	This function became deprecated, do not use this function. Instead, use <code>mysql_real_escape_string</code> .

Examples

Example 22.30. `mysql_escape_string` example

```
<?php
$item = "Zak's Laptop";
$escaped_item = mysql_escape_string($item);
printf("Escaped string: %s\n", $escaped_item);
?>
```

The above example will output:

```
Escaped string: Zak\'s Laptop
```

Notes

Note

`mysql_escape_string` does not escape `%` and `_`.

See Also

`mysql_real_escape_string`
`addslashes`
The `magic_quotes_gpc` directive.

22.10.1.4.13. `mysql_fetch_array`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_fetch_array`

Fetch a result row as an associative array, a numeric array, or both

Description

```
array mysql_fetch_array(resource result,
                      int result_type= MYSQL_BOTH);
```

Returns an array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

result_type The type of array that is to be fetched. It's a constant and can take the following values: [MYSQL_ASSOC](#), [MYSQL_NUM](#), and [MYSQL_BOTH](#).

Return Values

Returns an array of strings that corresponds to the fetched row, or [FALSE](#) if there are no more rows. The type of returned array depends on how *result_type* is defined. By using [MYSQL_BOTH](#) (default), you'll get an array with both associative and number indices. Using [MYSQL_ASSOC](#), you only get associative indices (as [mysql_fetch_assoc](#) works), using [MYSQL_NUM](#), you only get number indices (as [mysql_fetch_row](#) works).

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you must use the numeric index of the column or make an alias for the column. For aliased columns, you cannot access the contents with the original column name.

Examples**Example 22.31. Query with aliased duplicate field names**

```
SELECT table1.field AS foo, table2.field AS bar FROM table1, table2
```

Example 22.32. mysql_fetch_array with MYSQL_NUM

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_NUM)) {
    printf("ID: %s Name: %s", $row[0], $row[1]);
}

mysql_free_result($result);
?>
```

Example 22.33. mysql_fetch_array with MYSQL_ASSOC

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_ASSOC)) {
    printf("ID: %s Name: %s", $row["id"], $row["name"]);
}
```

```
mysql_free_result($result);
?>
```

Example 22.34. `mysql_fetch_array` with `MYSQL_BOTH`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_BOTH)) {
    printf ("ID: %s Name: %s", $row[0], $row["name"]);
}

mysql_free_result($result);
?>
```

Notes

Performance

An important thing to note is that using `mysql_fetch_array` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

See Also

[mysql_fetch_row](#)
[mysql_fetch_assoc](#)
[mysql_data_seek](#)
[mysql_query](#)

22.10.1.4.14. `mysql_fetch_assoc`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_fetch_assoc](#)

Fetch a result row as an associative array

Description

```
array mysql_fetch_assoc(resource result);
```

Returns an associative array that corresponds to the fetched row and moves the internal data pointer ahead. `mysql_fetch_assoc` is equivalent to calling `mysql_fetch_array` with `MYSQL_ASSOC` for the optional second parameter. It only returns an associative array.

Parameters

`result`

The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns an associative array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysql_fetch_row` or add alias names. See the example at the `mysql_fetch_array` description about aliases.

Examples

Example 22.35. An expanded `mysql_fetch_assoc` example

```
<?php
$conn = mysql_connect("localhost", "mysql_user", "mysql_password");
if (!$conn) {
    echo "Unable to connect to DB: " . mysql_error();
    exit;
}
if (!mysql_select_db("mydbname")) {
    echo "Unable to select mydbname: " . mysql_error();
    exit;
}
$sql = "SELECT id as userid, fullname, userstatus
        FROM sometable
        WHERE userstatus = 1";
$result = mysql_query($sql);
if (!$result) {
    echo "Could not successfully run query ($sql) from DB: " . mysql_error();
    exit;
}
if (mysql_num_rows($result) == 0) {
    echo "No rows found, nothing to print so am exiting";
    exit;
}
// While a row of data exists, put that row in $row as an associative array
// Note: If you're expecting just one row, no need to use a loop
// Note: If you put extract($row); inside the following loop, you'll
//       then create $userid, $fullname, and $userstatus
while ($row = mysql_fetch_assoc($result)) {
    echo $row["userid"];
    echo $row["fullname"];
    echo $row["userstatus"];
}
mysql_free_result($result);
?>
```

Notes

Performance

An important thing to note is that using `mysql_fetch_assoc` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

```

22.10.1.4.15. mysql_fetch_field

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_fetch_field](#)

Get column information from a result and return as an object

Description

```
object mysql_fetch_field(resource result,
                         int field_offset= =0);
```

Returns an object containing field information. This function can be used to obtain information about fields in the provided query result.

Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to mysql_query .
<i>field_offset</i>	The numerical field offset. If the field offset is not specified, the next field that was not yet retrieved by this function is retrieved. The <i>field_offset</i> starts at 0.

Return Values

Returns an object containing field information. The properties of the object are:

- name - column name
- table - name of the table the column belongs to
- max_length - maximum length of the column
- not_null - 1 if the column cannot be [NULL](#)
- primary_key - 1 if the column is a primary key
- unique_key - 1 if the column is a unique key
- multiple_key - 1 if the column is a non-unique key
- numeric - 1 if the column is numeric
- blob - 1 if the column is a BLOB
- type - the type of the column
- unsigned - 1 if the column is unsigned
- zerofill - 1 if the column is zero-filled

Examples

Example 22.36. mysql_fetch_field example

```
<?php
$conn = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$conn) {
    die('Could not connect: ' . mysql_error());
```

```

}
mysql_select_db('database');
$result = mysql_query('select * from table');
if (!$result) {
    die('Query failed: ' . mysql_error());
}
/* get column metadata */
$i = 0;
while ($i < mysql_num_fields($result)) {
    echo "Information for column $i:<br />\n";
    $meta = mysql_fetch_field($result, $i);
    if (!($meta)) {
        echo "No information available<br />\n";
    }
    echo '<pre>';
blob:           $meta->blob
max_length:    $meta->max_length
multiple_key:  $meta->multiple_key
name:          $meta->name
not_null:      $meta->not_null
numeric:       $meta->numeric
primary_key:   $meta->primary_key
table:         $meta->table
type:          $meta->type
unique_key:    $meta->unique_key
unsigned:      $meta->unsigned
zerofill:      $meta->zerofill
</pre>';
    $i++;
}
mysql_free_result($result);
?>

```

Notes

Note

Field names returned by this function are *case-sensitive*.

See Also

[mysql_field_seek](#)

22.10.1.4.16. mysql_fetch_lengths

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_fetch_lengths](#)

Get the length of each output in a result

Description

```
array mysql_fetch_lengths(resource result);
```

Returns an array that corresponds to the lengths of each field in the last row fetched by MySQL.

[mysql_fetch_lengths](#) stores the lengths of each result column in the last row returned by [mysql_fetch_row](#), [mysql_fetch_assoc](#), [mysql_fetch_array](#), and [mysql_fetch_object](#) in an array, starting at offset 0.

Parameters

[result](#)

The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

An array of lengths on success or [FALSE](#) on failure.

Examples

Example 22.37. A mysql_fetch_lengths example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row    = mysql_fetch_assoc($result);
$lengths = mysql_fetch_lengths($result);

print_r($row);
print_r($lengths);
?>
```

The above example will output something similar to:

```
Array
(
    [id] => 42
    [email] => user@example.com
)
Array
(
    [0] => 2
    [1] => 16
)
```

See Also

[mysql_field_len](#)
[mysql_fetch_row](#)
[strlen](#)

22.10.1.4.17. mysql_fetch_object

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_fetch_object](#)

Fetch a result row as an object

Description

```
object mysql_fetch_object(resource result,
                           string class_name,
                           array params);
```

Returns an object with properties that correspond to the fetched row and moves the internal data pointer ahead.

Parameters

result

The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

class_name

The name of the class to instantiate, set the properties of and return. If not specified, a `stdClass` object is returned.

params

An optional array of parameters to pass to the constructor for *class_name* objects.

Return Values

Returns an object with string properties that correspond to the fetched row, or `FALSE` if there are no more rows.

Changelog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 22.38. `mysql_fetch_object` example

```
<?php
mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");
$result = mysql_query("select * from mytable");
while ($row = mysql_fetch_object($result)) {
    echo $row->user_id;
    echo $row->fullname;
}
mysql_free_result($result);
?>
```

Example 22.39. `mysql_fetch_object` example

```
<?php
class foo {
    public $name;
}

mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");

$result = mysql_query("select name from mytable limit 1");
$obj = mysql_fetch_object($result, 'foo');
var_dump($obj);
?>
```

Notes

Performance

Speed-wise, the function is identical to `mysql_fetch_array`, and almost as quick as `mysql_fetch_row` (the difference is insignificant).

Note

`mysql_fetch_object` is similar to `mysql_fetch_array`, with one difference - an object is returned, instead of an array. Indirectly, that means that you can only access the data by the field names, and not by their offsets (numbers are illegal property names).

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

mysql_fetch_row
mysql_data_seek
mysql_query
```

22.10.1.4.18. mysql_fetch_row

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_fetch_row](#)

Get a result row as an enumerated array

Description

```
array mysql_fetch_row(resource result);
```

Returns a numerical array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

<i>result</i>	The result resource that is being evaluated. This result comes from a call to mysql_query .
---------------	---

Return Values

Returns an numerical array of strings that corresponds to the fetched row, or [FALSE](#) if there are no more rows.

[mysql_fetch_row](#) fetches one row of data from the result associated with the specified result identifier. The row is returned as an array. Each result column is stored in an array offset, starting at offset 0.

Examples

Example 22.40. Fetching one row with mysql_fetch_row

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row = mysql_fetch_row($result);
echo $row[0]; // 42
echo $row[1]; // the email value
?>
```

Notes

Note

This function sets NULL fields to the PHP [NULL](#) value.

mysql_fetch_lengths
mysql_result
```

22.10.1.4.19. mysql_field_flags

Copyright 1997-2010 the PHP Documentation Group.

- **`mysql_field_flags`**

Get the flags associated with the specified field in a result

Description

```
string mysql_field_flags(resource result,
                          int field_offset);
```

`mysql_field_flags` returns the field flags of the specified field. The flags are reported as a single word per flag separated by a single space, so that you can split the returned value using `explode`.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

Return Values

Returns a string of flags associated with the result or `FALSE` on failure.

The following flags are reported, if your version of MySQL is current enough to support them: "not_null", "primary_key", "unique_key", "multiple_key", "blob", "unsigned", "zerofill", "binary", "enum", "auto_increment" and "timestamp".

Examples

Example 22.41. A `mysql_field_flags` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$flags = mysql_field_flags($result, 0);
echo $flags;
print_r(explode(' ', $flags));
?>
```

The above example will output something similar to:

```
not_null primary_key auto_increment
Array
(
    [0] => not_null
    [1] => primary_key
    [2] => auto_increment
)
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldflags`

See Also

[mysql_field_type](#)
[mysql_field_len](#)

22.10.1.4.20. mysql_field_len

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_field_len](#)

Returns the length of the specified field

Description

```
int mysql_field_len(resource result,
                     int field_offset);
```

`mysql_field_len` returns the length of the specified field.

Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to mysql_query .
<code>field_offset</code>	The numerical field offset. The <code>field_offset</code> starts at 0. If <code>field_offset</code> does not exist, an error of level <code>E_WARNING</code> is also issued.

Return Values

The length of the specified field index on success or `FALSE` on failure.

Examples**Example 22.42. mysql_field_len example**

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}

// Will get the length of the id field as specified in the database
// schema.
$length = mysql_field_len($result, 0);
echo $length;
?>
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_fieldlen`

See Also

[mysql_fetch_lengths](#)
[strlen](#)

22.10.1.4.21. mysql_field_name

Copyright 1997-2010 the PHP Documentation Group.

- **`mysql_field_name`**

Get the name of the specified field in a result

Description

```
string mysql_field_name(resource result,
                        int field_offset);
```

`mysql_field_name` returns the name of the specified field index.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

Return Values

The name of the specified field index on success or `FALSE` on failure.

Examples

Example 22.43. `mysql_field_name` example

```
<?php
/* The users table consists of three fields:
 *   user_id
 *   username
 *   password.
 */
$link = @mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect to MySQL server: ' . mysql_error());
}
$dbname = 'mydb';
$db_selected = mysql_select_db($dbname, $link);
if (!$db_selected) {
    die("Could not set $dbname: " . mysql_error());
}
$res = mysql_query('select * from users', $link);

echo mysql_field_name($res, 0) . "\n";
echo mysql_field_name($res, 2);
?>
```

The above example will output:

```
user_id
password
```

Notes

Note

Field names returned by this function are *case-sensitive*.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldname`

See Also

[mysql_field_type](#)
[mysql_field_len](#)

22.10.1.4.22. `mysql_field_seek`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_field_seek](#)

Set result pointer to a specified field offset

Description

```
bool mysql_field_seek(resource result,
                      int field_offset);
```

Seeks to the specified field offset. If the next call to [mysql_fetch_field](#) doesn't include a field offset, the field offset specified in [mysql_field_seek](#) will be returned.

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

field_offset The numerical field offset. The *field_offset* starts at 0. If *field_offset* does not exist, an error of level [E_WARNING](#) is also issued.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

[mysql_fetch_field](#)

22.10.1.4.23. `mysql_field_table`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_field_table](#)

Get name of the table the specified field is in

Description

```
string mysql_field_table(resource result,
                         int field_offset);
```

Returns the name of the table that the specified field is in.

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

field_offset The numerical field offset. The *field_offset* starts at 0. If *field_offset* does not exist, an error of level [E_WARNING](#) is also issued.

Return Values

The name of the table on success.

Examples

Example 22.44. A `mysql_field_table` example

```
<?php
$query = "SELECT account.*, country.* FROM account, country WHERE country.name = 'Portugal' AND account.country_id = country.id";
// get the result from the DB
$result = mysql_query($query);

// Lists the table name and then the field name
for ($i = 0; $i < mysql_num_fields($result); ++$i) {
    $table = mysql_field_table($result, $i);
    $field = mysql_field_name($result, $i);

    echo "$table: $field\n";
}
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldtable`

See Also

[mysql_list_tables](#)

22.10.1.4.24. `mysql_field_type`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_field_type](#)

Get the type of the specified field in a result

Description

```
string mysql_field_type(resource result,
                        int field_offset);
```

`mysql_field_type` is similar to the [mysql_field_name](#) function. The arguments are identical, but the field type is returned instead.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level [E_WARNING](#) is also issued.

Return Values

The returned field type will be one of "int", "real", "string", "blob", and others as detailed in the [MySQL documentation](#).

Examples

Example 22.45. `mysql_field_type` example

```
<?php
mysql_connect("localhost", "mysql_username", "mysql_password");
mysql_select_db("mysql");
$result = mysql_query("SELECT * FROM func");
$fields = mysql_num_fields($result);
$rows = mysql_num_rows($result);
$table = mysql_field_table($result, 0);
echo "Your '".$table."' table has ".$fields." fields and ".$rows." record(s)\n";
echo "The table has the following fields:\n";
for ($i=0; $i < $fields; $i++) {
    $type = mysql_field_type($result, $i);
    $name = mysql_field_name($result, $i);
    $len = mysql_field_len($result, $i);
    $flags = mysql_field_flags($result, $i);
    echo $type . " " . $name . " " . $len . " " . $flags . "\n";
}
mysql_free_result($result);
mysql_close();
?>
```

The above example will output something similar to:

```
Your 'func' table has 4 fields and 1 record(s)
The table has the following fields:
string name 64 not_null primary_key binary
int ret 1 not_null
string dl 128 not_null
string type 9 not_null enum
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldtype`

See Also

[mysql_field_name](#)
[mysql_field_len](#)

22.10.1.4.25. `mysql_free_result`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_free_result](#)

Free result memory

Description

```
bool mysql_free_result(resource result);
```

`mysql_free_result` will free all memory associated with the result identifier `result`.

`mysql_free_result` only needs to be called if you are concerned about how much memory is being used for queries that return large result sets. All associated result memory is automatically freed at the end of the script's execution.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

If a non-resource is used for the `result`, an error of level E_WARNING will be emitted. It's worth noting that `mysql_query` only returns a resource for SELECT, SHOW, EXPLAIN, and DESCRIBE queries.

Examples

Example 22.46. A `mysql_free_result` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
/* Use the result, assuming we're done with it afterwards */
$row = mysql_fetch_assoc($result);

/* Now we free up the result and continue on with our script */
mysql_free_result($result);

echo $row['id'];
echo $row['email'];
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_freeresult`

`mysql_query`
`is_resource`

22.10.1.4.26. `mysql_get_client_info`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_get_client_info`

Get MySQL client info

Description

```
string mysql_get_client_info();
```

`mysql_get_client_info` returns a string that represents the client library version.

Return Values

The MySQL client version.

Examples

Example 22.47. `mysql_get_client_info` example

```
<?php
printf("MySQL client info: %s\n", mysql_get_client_info());
?>
```

The above example will output something similar to:

```
MySQL client info: 3.23.39
```

[mysql_get_server_info](#)

22.10.1.4.27. [mysql_get_host_info](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_get_host_info](#)

Get MySQL host info

Description

```
string mysql_get_host_info(resource link_identifier);
```

Describes the type of connection in use for the connection, including the server host name.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns a string describing the type of MySQL connection in use for the connection or [FALSE](#) on failure.

Examples

Example 22.48. [mysql_get_host_info](#) example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL host info: %s\n", mysql_get_host_info());
?>
```

The above example will output something similar to:

```
MySQL host info: Localhost via UNIX socket
```

- [mysql_get_proto_info](#)

Get MySQL protocol info

Description

```
int mysql_get_proto_info(resource link_identifier);
```

Retrieves the MySQL protocol.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns the MySQL protocol on success or [FALSE](#) on failure.

Examples

Example 22.49. [mysql_get_proto_info](#) example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL protocol version: %s\n", mysql_get_proto_info());
?>
```

The above example will output something similar to:

```
MySQL protocol version: 10
```

See Also

```

22.10.1.4.29. mysql_get_server_info

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_get_server_info](#)

Get MySQL server info

Description

```
string mysql_get_server_info(resource link_identifier);
```

Retrieves the MySQL server version.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns the MySQL server version on success or [FALSE](#) on failure.

Examples

Example 22.50. mysql_get_server_info example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL server version: %s\n", mysql_get_server_info());
?>
```

The above example will output something similar to:

```
MySQL server version: 4.0.1-alpha
```

See Also

```
mysql_get_client_info
mysql_get_host_info
mysql_get_proto_info
phpversion
```

22.10.1.4.30. mysql_info

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_info](#)

Get information about the most recent query

Description

```
string mysql_info(resource link_identifier);
```

Returns detailed information about the last query.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns information about the statement on success, or [FALSE](#) on failure. See the example below for which statements provide information, and what the returned value may look like. Statements that are not listed will return [FALSE](#).

Examples

Example 22.51. Relevant MySQL Statements

Statements that return string values. The numbers are only for illustrating purpose; their values will correspond to the query.

```
INSERT INTO ... SELECT ...
String format: Records: 23 Duplicates: 0 Warnings: 0
INSERT INTO ... VALUES (...),(...),...
String format: Records: 37 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...
String format: Records: 42 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE
String format: Records: 60 Duplicates: 0 Warnings: 0
UPDATE
String format: Rows matched: 65 Changed: 65 Warnings: 0
```

Notes

Note

[mysql_info](#) returns a non- [FALSE](#) value for the `INSERT ... VALUES` statement only if multiple value lists are specified in the statement.

See Also

[mysql_affected_rows](#)
[mysql_insert_id](#)
[mysql_stat](#)

22.10.1.4.31. [mysql_insert_id](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_insert_id](#)

Get the ID generated in the last query

Description

```
int mysql_insert_id(resource link_identifier);
```

Retrieves the ID generated for an AUTO_INCREMENT column by the previous query (usually INSERT).

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The ID generated for an AUTO_INCREMENT column by the previous query on success, `0` if the previous query does not generate an AUTO_INCREMENT value, or `FALSE` if no MySQL connection was established.

Examples

Example 22.52. `mysql_insert_id` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

mysql_query("INSERT INTO mytable (product) values ('kossu')");
printf("Last inserted record has id %d\n", mysql_insert_id());
?>
```

Notes

Caution

`mysql_insert_id` will convert the return type of the native MySQL C API function `mysql_insert_id()` to a type of `long` (named `int` in PHP). If your AUTO_INCREMENT column has a column type of BIGINT (64 bits) the conversion may result in an incorrect value. Instead, use the internal MySQL SQL function `LAST_INSERT_ID()` in an SQL query. For more information about PHP's maximum integer values, please see the `integer` documentation.

Note

Because `mysql_insert_id` acts on the last performed query, be sure to call `mysql_insert_id` immediately after the query that generates the value.

Note

The value of the MySQL SQL function `LAST_INSERT_ID()` always contains the most recently generated AUTO_INCREMENT value, and is not reset between queries.

[mysql_info](#)

22.10.1.4.32. `mysql_list_dbs`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_list_dbs](#)

List databases available on a MySQL server

Description

```
resource mysql_list_dbs(resource link_identifier);
```

Returns a result pointer containing the databases available from the current mysql daemon.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a result pointer resource on success, or `FALSE` on failure. Use the `mysql_tableinfo` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

Examples**Example 22.53. `mysql_list_dbs` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$db_list = mysql_list_dbs($link);

while ($row = mysql_fetch_object($db_list)) {
    echo $row->Database . "\n";
}
?>
```

The above example will output something similar to:

```
database1
database2
database3
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_listdbs`

See Also

`mysql_db_name`
`mysql_select_db`

22.10.1.4.33. `mysql_list_fields`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_list_fields`

List MySQL table fields

Description

```
resource mysql_list_fields(string database_name,
                           string table_name,
                           resource link_identifier);
```

Retrieves information about the given table name.

This function is deprecated. It is preferable to use [mysql_query](#) to issue an SQL `SHOW COLUMNS FROM table [LIKE 'name']` statement instead.

Parameters

`database_name`

The name of the database that's being queried.

`table_name`

The name of the table that's being queried.

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success, or `FALSE` on failure.

The returned result can be used with `mysql_field_flags`, `mysql_field_len`, `mysql_field_name` and `mysql_field_type`.

Examples

Example 22.54. Alternate to deprecated `mysql_list_fields`

```
<?php
$result = mysql_query("SHOW COLUMNS FROM sometable");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
if (mysql_num_rows($result) > 0) {
    while ($row = mysql_fetch_assoc($result)) {
        print_r($row);
    }
}
?>
```

The above example will output something similar to:

```
Array
(
    [Field] => id
    [Type] => int(7)
    [Null] =>
    [Key] => PRI
    [Default] =>
    [Extra] => auto_increment
)
Array
(
    [Field] => email
    [Type] => varchar(100)
    [Null] =>
    [Key] =>
    [Default] =>
    [Extra] =>
)
```

Notes**Note**

For backward compatibility, the following deprecated alias may be used: `mysql_listfields`

22.10.1.4.34. mysql_list_processes

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_list_processes`

List MySQL processes

Description

```
resource mysql_list_processes(resource link_identifier);
```

Retrieves the current MySQL server threads.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success or `FALSE` on failure.

Examples**Example 22.55. mysql_list_processes example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');

$result = mysql_list_processes($link);
while ($row = mysql_fetch_assoc($result)){
    printf("%s %s %s %s %s\n", $row["Id"], $row["Host"], $row["db"],
           $row["Command"], $row["Time"]);
}
mysql_free_result($result);
?>
```

The above example will output something similar to:

```
1 localhost test Processlist 0
4 localhost mysql sleep 5
```

See Also

```
mysql_thread_id
mysql_stat
```

22.10.1.4.35. mysql_list_tables

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_list_tables](#)

List tables in a MySQL database

Description

```
resource mysql_list_tables(string database,
                           resource link_identifier);
```

Retrieves a list of table names from a MySQL database.

This function is deprecated. It is preferable to use [mysql_query](#) to issue an SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

database The name of the database

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

A result pointer resource on success or [FALSE](#) on failure.

Use the [mysql_tablelename](#) function to traverse this result pointer, or any function for result tables, such as [mysql_fetch_array](#).

Changelog

Version	Description
4.3.7	This function became deprecated.

Examples

Example 22.56. mysql_list_tables alternative example

```
<?php
$dbname = 'mysql_dbname';

if (!mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

$sql = "SHOW TABLES FROM $dbname";
$result = mysql_query($sql);

if (!$result) {
    echo 'DB Error, could not list tables\n';
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_row($result)) {
    echo 'Table: {$row[0]}\n';
```

```
}
```

```
mysql_free_result($result);
?>
```

Notes

Note

22.10.1.4.36. mysql_num_fields

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_num_fields](#)

Get number of fields in result

Description

```
int mysql_num_fields(resource result);
```

Retrieves the number of fields from a query.

Parameters

result

The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

Returns the number of fields in the result set resource on success or [FALSE](#) on failure.

Examples

Example 22.57. A mysql_num_fields example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
/* returns 2 because id,email === two fields */
echo mysql_num_fields($result);
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: [mysql_numfields](#)

See Also

22.10.1.4.37. mysql_num_rows

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_num_rows](#)

Get number of rows in result

Description

```
int mysql_num_rows(resource result);
```

Retrieves the number of rows from a result set. This command is only valid for statements like SELECT or SHOW that return an actual result set. To retrieve the number of rows affected by a INSERT, UPDATE, REPLACE or DELETE query, use [mysql_affected_rows](#).

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

The number of rows in a result set on success or **FALSE** on failure.

Examples**Example 22.58. mysql_num_rows example**

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");
mysql_select_db("database", $link);

$result = mysql_query("SELECT * FROM table1", $link);
$num_rows = mysql_num_rows($result);

echo "$num_rows Rows\n";
?>
```

Notes**Note**

If you use [mysql_unbuffered_query](#), [mysql_num_rows](#) will not return the correct value until all the rows in the result set have been retrieved.

Note

For backward compatibility, the following deprecated alias may be used: [mysql_numrows](#)

mysql_query
```

22.10.1.4.38. mysql_pconnect

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_pconnect](#)

Open a persistent connection to a MySQL server

Description

```
resource mysql_pconnect(string server= ini_get("mysql.default_host"),
                        string username= ini_get("mysql.default_user"),
                        string password= ini_get("mysql.default_password"),
                        int client_flags);
```

Establishes a persistent connection to a MySQL server.

[mysql_pconnect](#) acts very much like [mysql_connect](#) with two major differences.

First, when connecting, the function would first try to find a (persistent) link that's already open with the same host, username and password. If one is found, an identifier for it will be returned instead of opening a new connection.

Second, the connection to the SQL server will not be closed when the execution of the script ends. Instead, the link will remain open for future use ([mysql_close](#) will not close links established by [mysql_pconnect](#)).

This type of link is therefore called 'persistent'.

Parameters

server The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost.

If the PHP directive [mysql.default_host](#) is undefined (default), then the default value is 'localhost:3306'

username The username. Default value is the name of the user that owns the server process.

password The password. Default value is an empty password.

client_flags The [client_flags](#) parameter can be a combination of the following constants: 128 (enable [LOAD DATA LOCAL](#) handling), [MYSQL_CLIENT_SSL](#), [MYSQL_CLIENT_COMPRESS](#), [MYSQL_CLIENT_IGNORE_SPACE](#) or [MYSQL_CLIENT_INTERACTIVE](#).

Return Values

Returns a MySQL persistent link identifier on success, or [FALSE](#) on failure.

Changelog

Version	Description
4.3.0	Added the client_flags parameter.

Notes

Note

Note, that these kind of links only work if you are using a module version of PHP. See the [Persistent Database Connections](#) section for more information.

Warning

Using persistent connections can require a bit of tuning of your Apache and MySQL configurations to ensure that you do not exceed the number of connections allowed by MySQL.

Note

You can suppress the error message on failure by prepending a `@` to the function name.

See Also

[mysql_connect](#)
[Persistent Database Connections](#)

22.10.1.4.39. mysql_ping

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_ping](#)

Ping a server connection or reconnect if there is no connection

Description

```
bool mysql_ping(resource link_identifier);
```

Checks whether or not the connection to the server is working. If it has gone down, an automatic reconnection is attempted. This function can be used by scripts that remain idle for a long while, to check whether or not the server has closed the connection and reconnect if necessary.

Note

Since MySQL 5.0.13, automatic reconnection feature is disabled.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns `TRUE` if the connection to the server MySQL server is working, otherwise `FALSE`.

Examples**Example 22.59. A mysql_ping example**

```
<?php
set_time_limit(0);

$conn = mysql_connect('localhost', 'mysqluser', 'mypass');
$db   = mysql_select_db('mydb');

/* Assuming this query will take a long time */
$result = mysql_query($sql);
if (!$result) {
    echo 'Query #1 failed, exiting.';
    exit;
}

/* Make sure the connection is still alive, if not, try to reconnect */
if (!mysql_ping($conn)) {
    echo 'Lost connection, exiting after query #1';
    exit;
}
```

```
mysql_free_result($result);

/* So the connection is still alive, let's run another query */
$result2 = mysql_query($sql2);
?>
```

22.10.1.4.40. `mysql_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_query](#)

Send a MySQL query

Description

```
resource mysql_query(string query,
                     resource link_identifier);
```

`mysql_query` sends a unique query (multiple queries are not supported) to the currently active database on the server that's associated with the specified [link_identifier](#).

Parameters

`query`

An SQL query

The query string should not end with a semicolon. Data inside the query should be [properly escaped](#).

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE, EXPLAIN and other statements returning resultset, `mysql_query` returns a resource on success, or `FALSE` on error.

For other type of SQL statements, INSERT, UPDATE, DELETE, DROP, etc, `mysql_query` returns `TRUE` on success or `FALSE` on error.

The returned result resource should be passed to `mysql_fetch_array`, and other functions for dealing with result tables, to access the returned data.

Use `mysql_num_rows` to find out how many rows were returned for a SELECT statement or `mysql_affected_rows` to find out how many rows were affected by a DELETE, INSERT, REPLACE, or UPDATE statement.

`mysql_query` will also fail and return `FALSE` if the user does not have permission to access the table(s) referenced by the query.

Examples

Example 22.60. Invalid Query

The following query is syntactically invalid, so `mysql_query` fails and returns `FALSE`.

```
<?php
$result = mysql_query('SELECT * WHERE 1=1');
if (!$result) {
    die('Invalid query: ' . mysql_error());
}
?>
```

Example 22.61. Valid Query

The following query is valid, so `mysql_query` returns a resource.

```
<?php
// This could be supplied by a user, for example
$firstname = 'fred';
$lastname  = 'fox';

// Formulate Query
// This is the best way to perform an SQL query
// For more examples, see mysql_real_escape_string()
$query = sprintf("SELECT firstname, lastname, address, age FROM friends WHERE firstname='%s' AND lastname='%s'",
    mysql_real_escape_string($firstname),
    mysql_real_escape_string($lastname));

// Perform Query
$result = mysql_query($query);

// Check result
// This shows the actual query sent to MySQL, and the error. Useful for debugging.
if (!$result) {
    $message = 'Invalid query: ' . mysql_error() . "\n";
    $message .= 'Whole query: ' . $query;
    die($message);
}

// Use result
// Attempting to print $result won't allow access to information in the resource
// One of the mysql result functions must be used
// See also mysql_result(), mysql_fetch_array(), mysql_fetch_row(), etc.
while ($row = mysql_fetch_assoc($result)) {
    echo $row['firstname'];
    echo $row['lastname'];
    echo $row['address'];
    echo $row['age'];
}

// Free the resources associated with the result set
// This is done automatically at the end of the script
mysql_free_result($result);
?>
```

22.10.1.4.41. `mysql_real_escape_string`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_real_escape_string](#)

Escapes special characters in a string for use in an SQL statement

Description

```
string mysql_real_escape_string(string unescaped_string,
```

```
resource link_identifier);
```

Escapes special characters in the `unespaced_string`, taking into account the current character set of the connection so that it is safe to place it in a `mysql_query`. If binary data is to be inserted, this function must be used.

`mysql_real_escape_string` calls MySQL's library function `mysql_real_escape_string`, which prepends backslashes to the following characters: `\x00`, `\n`, `\r`, `\`, `'`, `"` and `\x1a`.

This function must always (with few exceptions) be used to make data safe before sending a query to MySQL.

Parameters

<code>unespaced_string</code>	The string that is to be escaped.
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns the escaped string, or `FALSE` on error.

Examples

Example 22.62. Simple `mysql_real_escape_string` example

```
<?php
// Connect
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
    OR die(mysql_error());

// Query
$query = sprintf("SELECT * FROM users WHERE user='%s' AND password='%s'",
    mysql_real_escape_string($user),
    mysql_real_escape_string($password));
?>
```

Example 22.63. An example SQL Injection Attack

```
<?php
// Query database to check if there are any matching users
$query = "SELECT * FROM users WHERE user='$_POST['username']]' AND password='$_POST['password']]'";
mysql_query($query);

// We didn't check $_POST['password'], it could be anything the user wanted! For example:
$_POST['username'] = 'aidan';
$_POST['password'] = "' OR ''='";

// This means the query sent to MySQL would be:
echo $query;
?>
```

The query sent to MySQL:

```
SELECT * FROM users WHERE user='aidan' AND password='' OR ''=''
```

This would allow anyone to log in without a valid password.

Notes

Note

A MySQL connection is required before using `mysql_real_escape_string` otherwise an error of level `E_WARNING` is generated, and `FALSE` is returned. If `link_identifier` isn't defined, the last MySQL connection is used.

Note

If `magic_quotes_gpc` is enabled, first apply `stripslashes` to the data. Using this function on data which has already been escaped will escape the data twice.

Note

If this function is not used to escape data, the query is vulnerable to [SQL Injection Attacks](#).

Note

`mysql_real_escape_string` does not escape `%` and `_`. These are wildcards in MySQL if combined with `LIKE`, `GRANT`, or `REVOKE`.

See Also

`mysql_client_encoding`
`addslashes`
`stripslashes`
The `magic_quotes_gpc` directive
The `magic_quotes_runtime` directive

22.10.1.4.42. `mysql_result`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_result`

Get result data

Description

```
string mysql_result(resource result,  
                    int row,  
                    mixed field= 0);
```

Retrieves the contents of one cell from a MySQL result set.

When working on large result sets, you should consider using one of the functions that fetch an entire row (specified below). As these functions return the contents of multiple cells in one function call, they're MUCH quicker than `mysql_result`. Also, note that specifying a numeric offset for the field argument is much quicker than specifying a fieldname or tablename.fieldname argument.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`row` The row number from the result that's being retrieved. Row numbers start at 0.

`field` The name or offset of the field being retrieved.

It can be the field's offset, the field's name, or the field's table dot field name (tablename.fieldname). If the column name has been aliased ('select foo as bar from...'), use the alias instead of the column name. If undefined, the first field is retrieved.

Return Values

The contents of one cell from a MySQL result set on success, or `FALSE` on failure.

Examples

Example 22.64. `mysql_result` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
if (!mysql_select_db('database_name')) {
    die('Could not select database: ' . mysql_error());
}
$result = mysql_query('SELECT name FROM work.employee');
if (!$result) {
    die('Could not query:' . mysql_error());
}
echo mysql_result($result, 2); // outputs third employee's name
mysql_close($link);
?>
```

Notes

Note

Calls to `mysql_result` should not be mixed with calls to other functions that deal with the result set.

[mysql_fetch_object](#)

22.10.1.4.43. `mysql_select_db`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_select_db](#)

Select a MySQL database

Description

```
bool mysql_select_db(string database_name,
                     resource link_identifier);
```

Sets the current active database on the server that's associated with the specified link identifier. Every subsequent call to `mysql_query` will be made on the active database.

Parameters

database_name

The name of the database that is to be selected.

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns **TRUE** on success or **FALSE** on failure.

Examples

Example 22.65. `mysql_select_db` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Not connected : ' . mysql_error());
}

// make foo the current db
$db_selected = mysql_select_db('foo', $link);
if (!$db_selected) {
    die ('Can\'t use foo : ' . mysql_error());
}
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_selectdb`

See Also

[mysql_connect](#)
[mysql_pconnect](#)
[mysql_query](#)

22.10.1.4.44. `mysql_set_charset`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_set_charset](#)

Sets the client character set

Description

```
bool mysql_set_charset(string charset,  
                      resource link_identifier);
```

Sets the default character set for the current connection.

Parameters

charset A valid character set name.

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns **TRUE** on success or **FALSE** on failure.

Notes

Note

This function requires MySQL 5.0.7 or later.

Note

This is the preferred way to change the charset. Using `mysql_query` to execute `SET NAMES ...` is not recommended.

See Also

[mysql_client_encoding](#)
[List of character sets that MySQL supports](#)

22.10.1.4.45. mysql_stat

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_stat](#)

Get current system status

Description

```
string mysql_stat(resource link_identifier);
```

`mysql_stat` returns the current server status.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a string with the status for uptime, threads, queries, open tables, flush tables and queries per second. For a complete list of other status variables, you have to use the `SHOW STATUS` SQL command. If *link_identifier* is invalid, `NULL` is returned.

Examples**Example 22.66. mysql_stat example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$status = explode(' ', mysql_stat($link));
print_r($status);
?>
```

The above example will output something similar to:

```
Array
(
    [0] => Uptime: 5380
    [1] => Threads: 2
    [2] => Questions: 1321299
    [3] => Slow queries: 0
    [4] => Opens: 26
    [5] => Flush tables: 1
    [6] => Open tables: 17
    [7] => Queries per second avg: 245.595
```

)

Example 22.67. Alternative `mysql_stat` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$result = mysql_query('SHOW STATUS', $link);
while ($row = mysql_fetch_assoc($result)) {
    echo $row['Variable_name'] . ' = ' . $row['Value'] . "\n";
}
?>
```

The above example will output something similar to:

```
back_log = 50
basedir = /usr/local/
bdb_cache_size = 8388600
bdb_log_buffer_size = 32768
bdb_home = /var/db/mysql/
bdb_max_lock = 10000
bdb_logdir =
bdb_shared_data = OFF
bdb_tmpdir = /var/tmp/
...
```

[mysql_get_server_info](#)
[mysql_list_processes](#)

22.10.1.4.46. `mysql_tablename`

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_tablename](#)

Get table name of field

Description

```
string mysql_tablename(resource result,
                        int i);
```

Retrieves the table name from a *result*.

This function is deprecated. It is preferable to use [mysql_query](#) to issue an SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

<i>result</i>	A result pointer resource that's returned from mysql_list_tables .
<i>i</i>	The integer index (row/table number)

Return Values

The name of the table on success or `FALSE` on failure.

Use the `mysql_table_name` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

Examples

Example 22.68. `mysql_table_name` example

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password");
$result = mysql_list_tables("mydb");
$num_rows = mysql_num_rows($result);
for ($i = 0; $i < $num_rows; $i++) {
    echo "Table: ", mysql_table_name($result, $i), "\n";
}
mysql_free_result($result);
?>
```

Notes

Note

The `mysql_num_rows` function may be used to determine the number of tables in the result pointer.

`mysql_list_tables`
`mysql_field_table`
`mysql_db_name`

22.10.1.4.47. `mysql_thread_id`

Copyright 1997-2010 the PHP Documentation Group.

- `mysql_thread_id`

Return the current thread ID

Description

```
int mysql_thread_id(resource link_identifier);
```

Retrieves the current thread ID. If the connection is lost, and a reconnect with `mysql_ping` is executed, the thread ID will change. This means only retrieve the thread ID when needed.

Parameters

`link_identifier`

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The thread ID on success or `FALSE` on failure.

Examples

Example 22.69. mysql_thread_id example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$thread_id = mysql_thread_id($link);
if ($thread_id){
    printf("current thread id is %d\n", $thread_id);
}
?>
```

The above example will output something similar to:

```
current thread id is 73
```

See Also

[mysql_ping](#)
[mysql_list_processes](#)

22.10.1.4.48. mysql_unbuffered_query

Copyright 1997-2010 the PHP Documentation Group.

- [mysql_unbuffered_query](#)

Send an SQL query to MySQL without fetching and buffering the result rows.

Description

```
resource mysql_unbuffered_query(string query,
                                resource link_identifier);
```

[mysql_unbuffered_query](#) sends the SQL query [query](#) to MySQL without automatically fetching and buffering the result rows as [mysql_query](#) does. This saves a considerable amount of memory with SQL queries that produce large result sets, and you can start working on the result set immediately after the first row has been retrieved as you don't have to wait until the complete SQL query has been performed. To use [mysql_unbuffered_query](#) while multiple database connections are open, you must specify the optional parameter [link_identifier](#) to identify which connection you want to use.

Parameters

query The SQL query to execute.

Data inside the query should be [properly escaped](#).

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE or EXPLAIN statements, [mysql_unbuffered_query](#) returns a resource on success, or [FALSE](#) on error.

For other type of SQL statements, UPDATE, DELETE, DROP, etc, [mysql_unbuffered_query](#) returns [TRUE](#) on success or [FALSE](#) on error.

Notes

Note

The benefits of `mysql_unbuffered_query` come at a cost: you cannot use `mysql_num_rows` and `mysql_data_seek` on a result set returned from `mysql_unbuffered_query`. You also have to fetch all result rows from an unbuffered SQL query before you can send a new SQL query to MySQL.

22.10.2. MySQL Improved Extension (`Mysqli`)

[Copyright 1997-2010 the PHP Documentation Group.](#)

The `mysqli` extension allows you to access the functionality provided by MySQL 4.1 and above. More information about the MySQL Database server can be found at <http://www.mysql.com/>

An overview of software available for using MySQL from PHP can be found at [Section 22.10.2.2, “Overview”](#)

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

Parts of this documentation included from MySQL manual with permissions of Oracle Corporation.

22.10.2.1. Examples

[Copyright 1997-2010 the PHP Documentation Group.](#)

All examples in the `mysqli` documentation use the world database. The world database can be found at <http://downloads.mysql.com/docs/world.sql.gz>

22.10.2.2. Overview

[Copyright 1997-2010 the PHP Documentation Group.](#)

This section provides an introduction to the options available to you when developing a PHP application that needs to interact with a MySQL database.

What is an API?

An Application Programming Interface, or API, defines the classes, methods, functions and variables that your application will need to call in order to carry out its desired task. In the case of PHP applications that need to communicate with databases the necessary APIs are usually exposed via PHP extensions.

APIs can be procedural or object-oriented. With a procedural API you call functions to carry out tasks, with the object-oriented API you instantiate classes and then call methods on the resulting objects. Of the two the latter is usually the preferred interface, as it is more modern and leads to better organised code.

When writing PHP applications that need to connect to the MySQL server there are several API options available. This document discusses what is available and how to select the best solution for your application.

What is a Connector?

In the MySQL documentation, the term *connector* refers to a piece of software that allows your application to connect to the MySQL database server. MySQL provides connectors for a variety of languages, including PHP.

If your PHP application needs to communicate with a database server you will need to write PHP code to perform such activities as connecting to the database server, querying the database and other database-related functions. Software is required to provide the API that your PHP application will use, and also handle the communication between your application and the database server, possibly using other intermediate libraries where necessary. This software is known generically as a connector, as it allows your application to *connect* to a database server.

What is a Driver?

A driver is a piece of software designed to communicate with a specific type of database server. The driver may also call a library, such as the MySQL Client Library or the MySQL Native Driver. These libraries implement the low-level protocol used to communicate with the MySQL database server.

By way of an example, the [PHP Data Objects \(PDO\)](#) database abstraction layer may use one of several database-specific drivers. One of the drivers it has available is the PDO MYSQL driver, which allows it to interface with the MySQL server.

Sometimes people use the terms connector and driver interchangeably, this can be confusing. In the MySQL-related documentation the term “driver” is reserved for software that provides the database-specific part of a connector package.

What is an Extension?

In the PHP documentation you will come across another term - *extension*. The PHP code consists of a core, with optional extensions to the core functionality. PHP's MySQL-related extensions, such as the [mysqli](#) extension, and the [mysql](#) extension, are implemented using the PHP extension framework.

An extension typically exposes an API to the PHP programmer, to allow its facilities to be used programmatically. However, some extensions which use the PHP extension framework do not expose an API to the PHP programmer.

The PDO MySQL driver extension, for example, does not expose an API to the PHP programmer, but provides an interface to the PDO layer above it.

The terms API and extension should not be taken to mean the same thing, as an extension may not necessarily expose an API to the programmer.

What are the main PHP API offerings for using MySQL?

There are three main API options when considering connecting to a MySQL database server:

- PHP's MySQL Extension
- PHP's [mysqli](#) Extension
- PHP Data Objects (PDO)

Each has its own advantages and disadvantages. The following discussion aims to give a brief introduction to the key aspects of each API.

What is PHP's MySQL Extension?

This is the original extension designed to allow you to develop PHP applications that interact with a MySQL database. The [mysql](#) extension provides a procedural interface and is intended for use only with MySQL versions older than 4.1.3. This extension can be used with versions of MySQL 4.1.3 or newer, but not all of the latest MySQL server features will be available.

Note

If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use the [mysqli](#) extension instead.

The [mysql](#) extension source code is located in the PHP extension directory [ext/mysql](#).

For further information on the [mysql](#) extension, see [Section 22.10.1, “MySQL”](#).

What is PHP's mysqli Extension?

The [mysqli](#) extension, or as it is sometimes known, the MySQL *improved* extension, was developed to take advantage of new features found in MySQL systems versions 4.1.3 and newer. The [mysqli](#) extension is included with PHP versions 5 and later.

The [mysqli](#) extension has a number of benefits, the key enhancements over the [mysql](#) extension being:

- Object-oriented interface
- Support for Prepared Statements
- Support for Multiple Statements
- Support for Transactions
- Enhanced debugging capabilities
- Embedded server support

Note

If you are using MySQL versions 4.1.3 or later it is *strongly* recommended that you use this extension.

As well as the object-oriented interface the extension also provides a procedural interface.

The `mysqli` extension is built using the PHP extension framework, its source code is located in the directory `ext/mysqli`.

For further information on the `mysqli` extension, see [Section 22.10.2, “MySQL Improved Extension \(Mysqli\)”](#).

What is PDO?

PHP Data Objects, or PDO, is a database abstraction layer specifically for PHP applications. PDO provides a consistent API for your PHP application regardless of the type of database server your application will connect to. In theory, if you are using the PDO API, you could switch the database server you used, from say Firebird to MySQL, and only need to make minor changes to your PHP code.

Other examples of database abstraction layers include JDBC for Java applications and DBI for Perl.

While PDO has its advantages, such as a clean, simple, portable API, its main disadvantage is that it doesn't allow you to use all of the advanced features that are available in the latest versions of MySQL server. For example, PDO does not allow you to use MySQL's support for Multiple Statements.

PDO is implemented using the PHP extension framework, its source code is located in the directory `ext/pdo`.

For further information on PDO, see the [Section 22.10.4, “MySQL Functions \(PDO_MYSQL\)”](#).

What is the PDO MySQL driver?

The PDO MySQL driver is not an API as such, at least from the PHP programmer's perspective. In fact the PDO MySQL driver sits in the layer below PDO itself and provides MySQL-specific functionality. The programmer still calls the PDO API, but PDO uses the PDO MySQL driver to carry out communication with the MySQL server.

The PDO MySQL driver is one of several available PDO drivers. Other PDO drivers available include those for the Firebird and PostgreSQL database servers.

The PDO MySQL driver is implemented using the PHP extension framework. Its source code is located in the directory `ext/pdo_mysql`. It does not expose an API to the PHP programmer.

For further information on the PDO MySQL driver, see [Section 22.10.4, “MySQL Functions \(PDO_MYSQL\)”](#).

What is PHP's MySQL Native Driver?

In order to communicate with the MySQL database server the `mysql` extension, `mysqli` and the PDO MySQL driver each use a low-level library that implements the required protocol. In the past, the only available library was the MySQL Client Library, otherwise known as `libmysql`.

However, the interface presented by `libmysql` was not optimized for communication with PHP applications, as `libmysql` was originally designed with C applications in mind. For this reason the MySQL Native Driver, `mysqlnd`, was developed as an alternative to `libmysql` for PHP applications.

The `mysql` extension, the `mysqli` extension and the PDO MySQL driver can each be individually configured to use either `libmysql` or `mysqlnd`. As `mysqlnd` is designed specifically to be utilised in the PHP system it has numerous memory and speed enhancements over `libmysql`. You are strongly encouraged to take advantage of these improvements.

Note

The MySQL Native Driver can only be used with MySQL server versions 4.1.3 and later.

The MySQL Native Driver is implemented using the PHP extension framework. The source code is located in `ext/mysqlnd`. It does not expose an API to the PHP programmer.

Comparison of Features

The following table compares the functionality of the three main methods of connecting to MySQL from PHP:

	PHP's mysqli Extension	PDO (Using PDO MySQL Driver and MySQL Native Driver)	PHP's MySQL Extension
PHP version introduced	5.0	5.0	Prior to 3.0

	PHP's mysqli Extension	PDO (Using PDO MySQL Driver and MySQL Native Driver)	PHP's MySQL Extension
Included with PHP 5.x	yes	yes	Yes
MySQL development status	Active development	Active development as of PHP 5.3	Maintenance only
Recommended by MySQL for new projects	Yes - preferred option	Yes	No
API supports Charsets	Yes	Yes	No
API supports server-side Prepared Statements	Yes	Yes	No
API supports client-side Prepared Statements	No	Yes	No
API supports Stored Procedures	Yes	Yes	No
API supports Multiple Statements	Yes	Most	No
Supports all MySQL 4.1+ functionality	Yes	Most	No

22.10.2.3. Installing/Configuring

Copyright 1997-2010 the PHP Documentation Group.

22.10.2.3.1. Requirements

Copyright 1997-2010 the PHP Documentation Group.

In order to have these functions available, you must compile PHP with support for the mysqli extension.

Note

The mysqli extension is designed to work with MySQL version 4.1.13 or newer, or 5.0.7 or newer. For previous versions, please see the [MySQL extension documentation](#).

22.10.2.3.2. Installation

Copyright 1997-2010 the PHP Documentation Group.

The `mysqli` extension was introduced with PHP version 5.0.0. The MySQL Native Driver was included in PHP version 5.3.0.

22.10.2.3.2.1. Installation on Linux

Copyright 1997-2010 the PHP Documentation Group.

The common Unix distributions include binary versions of PHP that can be installed. Although these binary versions are typically built with support for MySQL extensions enabled, the extension libraries themselves may need to be installed using an additional package. Check the package manager than comes with your chosen distribution for availability.

Unless your Unix distribution comes with a binary package of PHP with the `mysqli` extension available, you will need to build PHP from source code. Building PHP from source allows you to specify the MySQL extensions you want to use, as well as your choice of client library for each extension.

22.10.2.3.2.1.1. PHP 5.0, 5.1, 5.2

Copyright 1997-2010 the PHP Documentation Group.

If building from source code, to ensure that the `mysqli` extension for PHP is enabled, you will need to configure the PHP source code to use `mysqli`. This is achieved by running the `configure` script with the option `-with-mysqli=mysql_config_path/mysql_config`, prior to building PHP. This will enable `mysqli` and it will use the MySQL Client Library (libmysql) to communicate with the MySQL Server.

The `mysql_config_path` represents the location of the `mysql_config` program that comes with MySQL Server.

22.10.2.3.2.1.2. PHP 5.3.0+

[Copyright 1997-2010 the PHP Documentation Group.](#)

With versions of PHP 5.3.0 and newer, `mysqli` uses MySQL Native Driver by default. This gives a number of benefits over `libmysql`.

This is the recommended option, as using the MySQL Native Driver results in improved performance and gives access to features not available when using the MySQL Client Library. Refer to [What is PHP's MySQL Native Driver?](#) for a brief overview of the advantages of MySQL Native Driver.

To use MySQL Native Driver with `mysqli` you need to configure the PHP source code using the `--with-mysqli=mysqlnd` option, prior to building PHP.

Note that it is possible to freely mix MySQL extensions and client libraries. For example, it is possible to enable the MySQL extension to use the MySQL Client Library (`libmysql`), while configuring the `mysqli` extension to use the MySQL Native Driver. However, all permutations of extension and client library are possible.

The following example builds the MySQL extension to use the MySQL Client Library, and the `mysqli` and PDO MYSQL extensions to use the MySQL Native Driver:

```
./configure --with-mysql=/usr/bin/mysql_config \
--with-mysqli=mysqlnd \
--with-pdo-mysql=mysqlnd
[other options]
```

22.10.2.3.2.2. Installation on Windows Systems

[Copyright 1997-2010 the PHP Documentation Group.](#)

On Windows, PHP is most commonly installed using the binary installer.

22.10.2.3.2.2.1. PHP 5.0, 5.1, 5.2

[Copyright 1997-2010 the PHP Documentation Group.](#)

Once PHP has been installed, some configuration is required to enable `mysqli` and specify the client library you want it to use.

The `mysqli` extension is not enabled by default, so the `php_mysqli.dll` DLL must be enabled inside `php.ini`. In order to do this you need to find the `php.ini` file (typically located in `c:\php`), and make sure you remove the comment (semi-colon) from the start of the line `extension=php_mysqli.dll`, in the section marked `[PHP_MYSQLI]`.

Also, if you want to use the MySQL Client Library with `mysqli`, you need to make sure PHP can access the client library file. The MySQL Client Library is included as a file named `libmysql.dll` in the Windows PHP distribution. This file needs to be available in the Windows system's `PATH` environment variable, so that it can be successfully loaded. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Copying `libmysql.dll` to the Windows system directory (typically `c:\Windows\system`) also works, as the system directory is by default in the system's `PATH`. However, this practice is strongly discouraged.

As with enabling any PHP extension (such as `php_mysqli.dll`), the PHP directive `extension_dir` should be set to the directory where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`.

Note

If when starting the web server an error similar to the following occurs: "`Unable to load dynamic library './php_mysqli.dll'`", this is because `php_mysqli.dll` and/or `libmysql.dll` cannot be found by the system.

22.10.2.3.2.2.2. PHP 5.3.0+

[Copyright 1997-2010 the PHP Documentation Group.](#)

On Windows, for PHP versions 5.3 and newer, the `mysqli` extension is enabled and uses the MySQL Native Driver by default. This means you don't need to worry about configuring access to `libmysql.dll`.

22.10.2.3.3. Runtime Configuration

[Copyright 1997-2010 the PHP Documentation Group.](#)

The behaviour of these functions is affected by settings in `php.ini`.

Table 22.8. MySQLi Configuration Options

Name	Default	Changeable	Changelog
<code>mysqli.allow_persistent</code>	"1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqli.max_persistent</code>	"-1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqli.max_links</code>	"-1"	PHP_INI_SYSTEM	Available since PHP 5.0.0.
<code>mysqli.default_port</code>	"3306"	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_host</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_user</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_pw</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.reconnect</code>	"0"	PHP_INI_SYSTEM	Available since PHP 4.3.5.
<code>mysqli.allow_local_infile</code>	"1"	PHP_INI_SYSTEM	Available since PHP 5.2.4.
<code>mysqli.cache_size</code>	"2000"	PHP_INI_SYSTEM	Available since PHP 5.3.0.

For further details and definitions of the preceding PHP_INI_* constants, see the chapter on [configuration changes](#).

Here's a short explanation of the configuration directives.

<code>mysqli.allow_persistent</code> integer	Enable the ability to create persistent connections using <code>mysqli_connect</code> .
<code>mysqli.max_persistent</code> integer	Maximum of persistent connections that can be made. Set to 0 for unlimited.
<code>mysqli.max_links</code> integer	The maximum number of MySQL connections per process.
<code>mysqli.default_port</code> integer	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time <code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.
<code>mysqli.default_socket</code> string	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysqli.default_host</code> string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in safe mode .
<code>mysqli.default_user</code> string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in safe mode .
<code>mysqli.default_pw</code> string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in safe mode .
<code>mysqli.reconnect</code> integer	Automatically reconnect if the connection was lost.
<code>mysqli.allow_local_infile</code> <code>mysqli.cache_size</code> integer	Available only with <code>mysqld</code> .

Users cannot set `MYSQL_OPT_READ_TIMEOUT` through an API call or runtime configuration setting. Note that if it were possible there would be differences between how `libmysql` and streams would interpret the value of `MYSQL_OPT_READ_TIMEOUT`.

22.10.2.3.4. Resource Types

[Copyright 1997-2010 the PHP Documentation Group](#).

This extension has no resource types defined.

22.10.2.4. The mysqli Extension and Persistent Connections

[Copyright 1997-2010 the PHP Documentation Group](#).

Persistent connection support was introduced in PHP 5.3 for the `mysqli` extension. Support was already present in PDO MYSQL and ext/mysql. The idea behind persistent connections is that a connection between a client process and a database can be reused by a client process, rather than being created and destroyed multiple times. This reduces the overhead of creating fresh connections every time one is required, as unused connections are cached and ready to be reused.

Unlike the `mysql` extension, `mysqli` does not provide a separate function for opening persistent connections. To open a persistent connection you must prepend `p:` to the hostname when connecting.

The problem with persistent connections is that they can be left in unpredictable states by clients. For example, a table lock might be activated before a client terminates unexpectedly. A new client process reusing this persistent connection will get the connection "as is". Any cleanup would need to be done by the new client process before it could make good use of the persistent connection, increasing the burden on the programmer.

The persistent connection of the `mysqli` extension however provides built-in cleanup handling code. The cleanup carried out by `mysqli` includes:

- Rollback active transactions
- Close and drop temporary tables
- Unlock tables
- Reset session variables
- Close prepared statements (always happens with PHP)
- Close handler
- Release locks acquired with `GET_LOCK`

This ensures that persistent connections are in a clean state on return from the connection pool, before the client process uses them.

The `mysqli` extension does this cleanup by automatically calling the C-API function `mysql_change_user()`.

The automatic cleanup feature has advantages and disadvantages though. The advantage is that the programmer no longer needs to worry about adding cleanup code, as it is called automatically. However, the disadvantage is that the code could *potentially* be a little slower, as the code to perform the cleanup needs to run each time a connection is returned from the connection pool.

It is possible to switch off the automatic cleanup code, by compiling PHP with `MYSQLI_NO_CHANGE_USER_ON_PCONNECT` defined.

Note

The `mysqli` extension supports persistent connections when using either MySQL Native Driver or MySQL Client Library.

22.10.2.5. Predefined Constants

Copyright 1997-2010 the PHP Documentation Group.

<code>MYSQLI_READ_DEFAULT_GROUP</code>	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQLI_READ_DEFAULT_FILE</code>
<code>MYSQLI_READ_DEFAULT_FILE</code>	Read options from the named option file instead of from <code>my.cnf</code>
<code>MYSQLI_OPT_CONNECT_TIMEOUT</code>	Connect timeout in seconds
<code>MYSQLI_OPT_LOCAL_INFILE</code>	Enables command <code>LOAD LOCAL INFILE</code>
<code>MYSQLI_INIT_COMMAND</code>	Command to execute when connecting to MySQL server. Will automatically be re-executed when reconnecting.
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the MySQL client library
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol

E	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable will be set to the value of the session <code>interactive_timeout</code> variable.
<code>MYSQLI_CLIENT_IGNORE_SPA</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>CE</code>	
<code>MYSQLI_CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax.
<code>MYSQLI_CLIENT_MULTI_QUER</code>	Allows multiple semicolon-delimited queries in a single <code>mysqli_query</code> call.
<code>IES</code>	
<code>MYSQLI_STORE_RESULT</code>	For using buffered resultsets
<code>MYSQLI_USE_RESULT</code>	For using unbuffered resultsets
<code>MYSQLI_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQLI_NUM</code>	Columns are returned into the array having an enumerated index.
<code>MYSQLI_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the associative index.
<code>MYSQLI_NOT_NULL_FLAG</code>	Indicates that a field is defined as <code>NOT NULL</code>
<code>MYSQLI_PRI_KEY_FLAG</code>	Field is part of a primary index
<code>MYSQLI_UNIQUE_KEY_FLAG</code>	Field is part of a unique index.
<code>MYSQLI_MULTIPLE_KEY_FLAG</code>	Field is part of an index.
<code>MYSQLI_BLOB_FLAG</code>	Field is defined as <code>BLOB</code>
<code>MYSQLI_UNSIGNED_FLAG</code>	Field is defined as <code>UNSIGNED</code>
<code>MYSQLI_ZEROFILL_FLAG</code>	Field is defined as <code>ZEROFILL</code>
<code>MYSQLI_AUTO_INCREMENT_FL</code>	Field is defined as <code>AUTO_INCREMENT</code>
<code>AG</code>	
<code>MYSQLI_TIMESTAMP_FLAG</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_SET_FLAG</code>	Field is defined as <code>SET</code>
<code>MYSQLI_NUM_FLAG</code>	Field is defined as <code>NUMERIC</code>
<code>MYSQLI_PART_KEY_FLAG</code>	Field is part of an multi-index
<code>MYSQLI_GROUP_FLAG</code>	Field is part of <code>GROUP BY</code>
<code>MYSQLI_TYPE_DECIMAL</code>	Field is defined as <code>DECIMAL</code>
<code>MYSQLI_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code> field (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_BIT</code>	Field is defined as <code>BIT</code> (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_TINY</code>	Field is defined as <code>TINYINT</code>
<code>MYSQLI_TYPE_SHORT</code>	Field is defined as <code>SMALLINT</code>
<code>MYSQLI_TYPE_LONG</code>	Field is defined as <code>INT</code>
<code>MYSQLI_TYPE_FLOAT</code>	Field is defined as <code>FLOAT</code>
<code>MYSQLI_TYPE_DOUBLE</code>	Field is defined as <code>DOUBLE</code>
<code>MYSQLI_TYPE_NULL</code>	Field is defined as <code>DEFAULT NULL</code>
<code>MYSQLI_TYPE_TIMESTAMP</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_TYPE_LONGLONG</code>	Field is defined as <code>BIGINT</code>
<code>MYSQLI_TYPE_INT24</code>	Field is defined as <code>MEDIUMINT</code>
<code>MYSQLI_TYPE_DATE</code>	Field is defined as <code>DATE</code>

<code>MYSQLI_TYPE_TIME</code>	Field is defined as <code>TIME</code>
<code>MYSQLI_TYPE_DATETIME</code>	Field is defined as <code>DATETIME</code>
<code>MYSQLI_TYPE_YEAR</code>	Field is defined as <code>YEAR</code>
<code>MYSQLI_TYPE_NEWDATE</code>	Field is defined as <code>DATE</code>
<code>MYSQLI_TYPE_INTERVAL</code>	Field is defined as <code>INTERVAL</code>
<code>MYSQLI_TYPE_ENUM</code>	Field is defined as <code>ENUM</code>
<code>MYSQLI_TYPE_SET</code>	Field is defined as <code>SET</code>
<code>MYSQLI_TYPE_TINY_BLOB</code>	Field is defined as <code>TINYBLOB</code>
<code>MYSQLI_TYPE_MEDIUM_BLOB</code>	Field is defined as <code>MEDIUMBLOB</code>
<code>MYSQLI_TYPE_LONG_BLOB</code>	Field is defined as <code>LONGBLOB</code>
<code>MYSQLI_TYPE_BLOB</code>	Field is defined as <code>BLOB</code>
<code>MYSQLI_TYPE_VAR_STRING</code>	Field is defined as <code>VARCHAR</code>
<code>MYSQLI_TYPE_STRING</code>	Field is defined as <code>STRING</code>
<code>MYSQLI_TYPE_CHAR</code>	Field is defined as <code>CHAR</code>
<code>MYSQLI_TYPE_GEOMETRY</code>	Field is defined as <code>GEOMETRY</code>
<code>MYSQLI_NEED_DATA</code>	More data available for bind variable
<code>MYSQLI_NO_DATA</code>	No more data available for bind variable
<code>MYSQLI_DATA_TRUNCATED</code>	Data truncation occurred. Available since PHP 5.1.0 and MySQL 5.0.5.
<code>MYSQLI_ENUM_FLAG</code>	Field is defined as <code>ENUM</code> . Available since PHP 5.3.0.
<code>MYSQLI_CURSOR_TYPE_FOR_U SER</code>	
<code>MYSQLI_CURSOR_TYPE_NO_CU RSOR</code>	
<code>MYSQLI_CURSOR_TYPE_READ_</code>	
<code>MYSQLI_CURSOR_TYPE_SCROLL</code>

22.10.2.6. The MySQLi Extension Function Summary

Copyright 1997-2010 the PHP Documentation Group.

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli->affected_rows</code>	<code>mysqli_affected_rows</code>	N/A	Gets the number of affected rows in a previous MySQL operation
<code>\$mysqli->client_info</code>	<code>mysqli_get_client_info</code>	N/A	Returns the MySQL client version as a string
<code>\$mysqli->client_version</code>	<code>mysqli_get_client_version</code>	N/A	Returns MySQL client version info as an integer
<code>\$mysqli->connect_errno</code>	<code>mysqli_connect_errno</code>	N/A	Returns the error code from last connect call
<code>\$mysqli->connect_error</code>	<code>mysqli_connect_error</code>	N/A	Returns a string description of the last connect error
<code>\$mysqli->errno</code>	<code>mysqli_errno</code>	N/A	Returns the error code for the most recent function call
<code>\$mysqli->error</code>	<code>mysqli_error</code>	N/A	Returns a string description of

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
			the last error
\$mysqli->field_count	mysqli_field_count	N/A	Returns the number of columns for the most recent query
\$mysqli->host_info	mysqli_get_host_info	N/A	Returns a string representing the type of connection used
\$mysqli->protocol_version	mysqli_get_proto_info	N/A	Returns the version of the MySQL protocol used
\$mysqli->server_info	mysqli_get_server_info	N/A	Returns the version of the MySQL server
\$mysqli->server_version	mysqli_get_server_version	N/A	Returns the version of the MySQL server as an integer
\$mysqli->info	mysqli_info	N/A	Retrieves information about the most recently executed query
\$mysqli->insert_id	mysqli_insert_id	N/A	Returns the auto generated id used in the last query
\$mysqli->sqlstate	mysqli_sqlstate	N/A	Returns the SQLSTATE error from previous MySQL operation
\$mysqli->warning_count	mysqli_warning_count	N/A	Returns the number of warnings from the last query for the given link
<i>Methods</i>			
mysqli->autocommit	mysqli_autocommit	N/A	Turns on or off auto-committing database modifications
mysqli->change_user	mysqli_change_user	N/A	Changes the user of the specified database connection
mysqli->character_set_name, mysqli->client_encoding	mysqli_character_set_name	mysqli_client_encoding	Returns the default character set for the database connection
mysqli->close	mysqli_close	N/A	Closes a previously opened database connection
mysqli->commit	mysqli_commit	N/A	Commits the current transaction
mysqli::__construct	mysqli_connect	N/A	Open a new connection to the MySQL server [Note: static (i.e. class) method]
mysqli->debug	mysqli_debug	N/A	Performs debugging operations
mysqli->dump_debug_info	mysqli_dump_debug_info	N/A	Dump debugging information into the log
mysqli->get_charset	mysqli_get_charset	N/A	Returns a character set object
mysqli->get_connection_stats	mysqli_get_connection_stats	N/A	Returns client connection statistics. Available only with mysqld .
mysqli->get_client_info	mysqli_get_client_info	N/A	Returns the MySQL client version as a string
mysqli->get_client_stats	mysqli_get_client_stats	N/A	Returns client per-process statistics. Available only with mysqld .
mysqli->get_cache_stats	mysqli_get_cache_stats	N/A	Returns client Zval cache statistics. Available only with mysqld .
mysqli->get_server_info	mysqli_get_server_info	N/A	NOT DOCUMENTED
mysqli->get_warnings	mysqli_get_warnings	N/A	NOT DOCUMENTED
mysqli::__init	mysqli_init	N/A	Initializes MySQLi and returns

MySQLi Class			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
			a resource for use with mysqli_real_connect. [Not called on an object, as it returns a \$mysqli object.]
<code>mysqli->kill</code>	<code>mysqli_kill</code>	N/A	Asks the server to kill a MySQL thread
<code>mysqli->more_results</code>	<code>mysqli_more_results</code>	N/A	Check if there are any more query results from a multi query
<code>mysqli->multi_query</code>	<code>mysqli_multi_query</code>	N/A	Performs a query on the database
<code>mysqli->next_result</code>	<code>mysqli_next_result</code>	N/A	Prepare next result from multi_query
<code>mysqli->options</code>	<code>mysqli_options</code>	<code>mysqli_set_opt</code>	Set options
<code>mysqli->ping</code>	<code>mysqli_ping</code>	N/A	Pings a server connection, or tries to reconnect if the connection has gone down
<code>mysqli->prepare</code>	<code>mysqli_prepare</code>	N/A	Prepare an SQL statement for execution
<code>mysqli->query</code>	<code>mysqli_query</code>	N/A	Performs a query on the database
<code>mysqli->real_connect</code>	<code>mysqli_real_connect</code>	N/A	Opens a connection to a mysql server
<code>mysqli->real_escape_string, mysqli->escape_string</code>	<code>mysqli_real_escape_string</code>	<code>mysqli_escape_string</code>	Escapes special characters in a string for use in an SQL statement, taking into account the current charset of the connection
<code>mysqli->real_query</code>	<code>mysqli_real_query</code>	N/A	Execute an SQL query
<code>mysqli->rollback</code>	<code>mysqli_rollback</code>	N/A	Rolls back current transaction
<code>mysqli->select_db</code>	<code>mysqli_select_db</code>	N/A	Selects the default database for database queries
<code>mysqli->set_charset</code>	<code>mysqli_set_charset</code>	N/A	Sets the default client character set
<code>mysqli->set_local_infile_default</code>	<code>mysqli_set_local_infile_default</code>	N/A	Unsets user defined handler for load local infile command
<code>mysqli->set_local_infile_handler</code>	<code>mysqli_set_local_infile_handler</code>	N/A	Set callback function for LOAD DATA LOCAL INFILE command
<code>mysqli->ssl_set</code>	<code>mysqli_ssl_set</code>	N/A	Used for establishing secure connections using SSL
<code>mysqli->stat</code>	<code>mysqli_stat</code>	N/A	Gets the current system status
<code>mysqli->stmt_init</code>	<code>mysqli_stmt_init</code>	N/A	Initializes a statement and returns an object for use with mysqli_stmt_prepare
<code>mysqli->store_result</code>	<code>mysqli_store_result</code>	N/A	Transfers a result set from the last query
<code>mysqli->thread_id</code>	<code>mysqli_thread_id</code>	N/A	Returns the thread ID for the current connection
<code>mysqli->thread_safe</code>	<code>mysqli_thread_safe</code>	N/A	Returns whether thread safety is given or not
<code>mysqli->use_result</code>	<code>mysqli_use_result</code>	N/A	Initiate a result set retrieval

MySQL_STMT			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli_stmt->affected_rows</code>	<code>mysqli_stmt_affected_rows</code>	N/A	Returns the total number of rows changed, deleted, or inserted by the last executed statement
<code>\$mysqli_stmt->errno</code>	<code>mysqli_stmt_errno</code>	N/A	Returns the error code for the most recent statement call
<code>\$mysqli_stmt->error</code>	<code>mysqli_stmt_error</code>	N/A	Returns a string description for last statement error
<code>\$mysqli_stmt->field_count</code>	<code>mysqli_stmt_field_count</code>	N/A	Returns the number of field in the given statement - not documented
<code>\$mysqli_stmt->insert_id</code>	<code>mysqli_stmt_insert_id</code>	N/A	Get the ID generated from the previous INSERT operation
<code>\$mysqli_stmt->num_rows</code>	<code>mysqli_stmt_num_rows</code>	N/A	Return the number of rows in statements result set
<code>\$mysqli_stmt->param_count</code>	<code>mysqli_stmt_param_count</code>	<code>mysqli_param_count</code>	Returns the number of parameter for the given statement
<code>\$mysqli_stmt->sqlstate</code>	<code>mysqli_stmt_sqlstate</code>	N/A	Returns SQLSTATE error from previous statement operation
<i>Methods</i>			
<code>mysqli_stmt->attr_get</code>	<code>mysqli_stmt_attr_get</code>	N/A	Used to get the current value of a statement attribute
<code>mysqli_stmt->attr_set</code>	<code>mysqli_stmt_attr_set</code>	N/A	Used to modify the behavior of a prepared statement
<code>mysqli_stmt->bind_param</code>	<code>mysqli_stmt_bind_param</code>	<code>mysqli_bind_param</code>	Binds variables to a prepared statement as parameters
<code>mysqli_stmt->bind_result</code>	<code>mysqli_stmt_bind_result</code>	<code>mysqli_bind_result</code>	Binds variables to a prepared statement for result storage
<code>mysqli_stmt->close</code>	<code>mysqli_stmt_close</code>	N/A	Closes a prepared statement
<code>mysqli_stmt->data_seek</code>	<code>mysqli_stmt_data_seek</code>	N/A	Seeks to an arbitrary row in statement result set
<code>mysqli_stmt->execute</code>	<code>mysqli_stmt_execute</code>	<code>mysqli_execute</code>	Executes a prepared Query
<code>mysqli_stmt->fetch</code>	<code>mysqli_stmt_fetch</code>	<code>mysqli_fetch</code>	Fetch results from a prepared statement into the bound variables
<code>mysqli_stmt->free_result</code>	<code>mysqli_stmt_free_result</code>	N/A	Frees stored result memory for the given statement handle
<code>\$mysqli_stmt->get_result()</code>	<code>mysqli_stmt_get_result</code>	N/A	NOT DOCUMENTED Available only with <code>mysqld</code> .
<code>mysqli_stmt->get_warnings</code>	<code>mysqli_stmt_get_warnings</code>	N/A	NOT DOCUMENTED
<code>\$mysqli_stmt->more_results()</code>	<code>mysqli_stmt_more_results()</code>	N/A	NOT DOCUMENTED Available only with <code>mysqld</code> .
<code>\$mysqli_stmt->next_result()</code>	<code>mysqli_stmt_next_result()</code>	N/A	NOT DOCUMENTED Available only with <code>mysqld</code> .
<code>mysqli_stmt->num_rows</code>	<code>mysqli_stmt_num_rows</code>	N/A	See also property <code>\$mysqli_stmt->num_rows</code>
<code>mysqli_stmt->prepare</code>	<code>mysqli_stmt_prepare</code>	N/A	Prepare an SQL statement for execution
<code>mysqli_stmt->reset</code>	<code>mysqli_stmt_reset</code>	N/A	Resets a prepared statement
<code>mysqli_stmt->result_metadata</code>	<code>mysqli_stmt_result_metadata</code>	<code>mysqli_get_metadata</code>	Returns result set metadata from a prepared statement
<code>mysqli_stmt->send_long_data</code>	<code>mysqli_stmt_send_long_data</code>	<code>mysqli_send_long_data</code>	Send data in blocks

MySQL_STMT			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<code>mysqli_stmt->store_result</code>	<code>mysqli_stmt_store_result</code>	N/A	Transfers a result set from a prepared statement

MySQLi_RESULT			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
<code>\$mysqli_result->current_field</code>	<code>mysqli_field_tell</code>	N/A	Get current field offset of a result pointer
<code>\$mysqli_result->field_count</code>	<code>mysqli_num_fields</code>	N/A	Get the number of fields in a result
<code>\$mysqli_result->lengths</code>	<code>mysqli_fetch_lengths</code>	N/A	Returns the lengths of the columns of the current row in the result set
<code>\$mysqli_result->num_rows</code>	<code>mysqli_num_rows</code>	N/A	Gets the number of rows in a result
<i>Methods</i>			
<code>mysqli_result->data_seek</code>	<code>mysqli_data_seek</code>	N/A	Adjusts the result pointer to an arbitrary row in the result
<code>mysqli_result->fetch_all</code>	<code>mysqli_fetch_all</code>	N/A	Fetches all result rows and returns the result set as an associative array, a numeric array, or both. Available only with <code>mysqld</code> .
<code>mysqli_result->fetch_array</code>	<code>mysqli_fetch_array</code>	N/A	Fetch a result row as an associative, a numeric array, or both
<code>mysqli_result->fetch_assoc</code>	<code>mysqli_fetch_assoc</code>	N/A	Fetch a result row as an associative array
<code>mysqli_result->fetch_field_direct</code>	<code>mysqli_fetch_field_direct</code>	N/A	Fetch meta-data for a single field
<code>mysqli_result->fetch_field</code>	<code>mysqli_fetch_field</code>	N/A	Returns the next field in the result set
<code>mysqli_result->fetch_fields</code>	<code>mysqli_fetch_fields</code>	N/A	Returns an array of objects representing the fields in a result set
<code>mysqli_result->fetch_object</code>	<code>mysqli_fetch_object</code>	N/A	Returns the current row of a result set as an object
<code>mysqli_result->fetch_row</code>	<code>mysqli_fetch_row</code>	N/A	Get a result row as an enumerated array
<code>mysqli_result->field_seek</code>	<code>mysqli_field_seek</code>	N/A	Set result pointer to a specified field offset
<code>mysqli_result->free</code> , <code>mysqli_result->close</code> , <code>mysqli_result->free_result</code>	<code>mysqli_free_result</code>	N/A	Frees the memory associated with a result

MySQL_Driver			
OOP Interface	Procedural Interface	Alias (Do not use)	Description
<i>Properties</i>			
N/A			
<i>Methods</i>			
<code>mysqli_driver->embedded_server_end</code>	<code>mysqli_embedded_server_end</code>	N/A	NOT DOCUMENTED
<code>mysqli_driver->embedded_server_start</code>	<code>mysqli_embedded_server_start</code>	N/A	NOT DOCUMENTED

Note

Alias functions are provided for backward compatibility purposes only. Do not use them in new projects.

22.10.2.7. The MySQLi class ([MySQLi](#))

[Copyright 1997-2010 the PHP Documentation Group.](#)

Represents a connection between PHP and a MySQL database.

```
MySQLi {
MySQLi

Properties

int affected_rows ;

string client_info ;

int client_version ;

string connect_errno ;

string connect_error ;

int errno ;

string error ;

int field_count ;

int mysqli_warning_count(mysqli link);

}
```

22.10.2.7.1. mysqli->affected_rows, mysqli_affected_rows

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->affected_rows](#)
 - [mysqli_affected_rows](#)
- Gets the number of affected rows in a previous MySQL operation

Description

Object oriented style

```
mysqli {
    int affected_rows ;
}
```

Procedural style

```
int mysqli_affected_rows(mysqli link);
```

Returns the number of rows affected by the last [INSERT](#), [UPDATE](#), [REPLACE](#) or [DELETE](#) query.

For SELECT statements [mysqli_affected_rows](#) works like [mysqli_num_rows](#).

Parameters

[link](#)

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an UPDATE statement, no rows matched the [WHERE](#) clause in the query or that no query has yet been executed. -1 indicates that the query returned an error.

Note

If the number of affected rows is greater than maximal int value, the number of affected rows will be returned as a string.

Examples

Example 22.70. mysqli->affected_rows example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error);
    exit();
}

/* Insert rows */
$mysqli->query("CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", $mysqli->affected_rows);

$mysqli->query("ALTER TABLE Language ADD Status int default 0");

/* update rows */
$mysqli->query("UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", $mysqli->affected_rows);

/* delete rows */
$mysqli->query("DELETE FROM Language WHERE Percentage < 50");
```

```

printf("Affected rows (DELETE): %d\n", $mysqli->affected_rows);

/* select all rows */
$result = $mysqli->query("SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", $mysqli->affected_rows);

$result->close();

/* Delete table Language */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}

/* Insert rows */
mysqli_query($link, "CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", mysqli_affected_rows($link));

mysqli_query($link, "ALTER TABLE Language ADD Status int default 0");

/* update rows */
mysqli_query($link, "UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", mysqli_affected_rows($link));

/* delete rows */
mysqli_query($link, "DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", mysqli_affected_rows($link));

/* select all rows */
$result = mysqli_query($link, "SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", mysqli_affected_rows($link));

mysqli_free_result($result);

/* Delete table Language */
mysqli_query($link, "DROP TABLE Language");

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Affected rows (INSERT): 984
Affected rows (UPDATE): 168
Affected rows (DELETE): 815
Affected rows (SELECT): 169

```

[mysqli_num_rows](#)
[mysqli_info](#)

22.10.2.7.2. `mysqli::autocommit`, `mysqli_autocommit`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::autocommit](#)
- [mysqli_autocommit](#)

Turns on or off auto-committing database modifications

Description

Object oriented style

```
bool mysqli::autocommit(bool mode);
```

Procedural style

```
bool mysqli_autocommit(mysqli link,
                      bool mode);
```

Turns on or off auto-commit mode on queries for the database connection.

To determine the current state of autocommit use the SQL command `SELECT @@autocommit`.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>mode</i>	Whether to turn on auto-commit or not.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

Note

This function doesn't work with non transactional table types (like MyISAM or ISAM).

Examples

Example 22.71. `mysqli::autocommit` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error());
    exit();
}

/* turn autocommit on */
$link->autocommit(TRUE);

if ($result = $link->query("SELECT @@autocommit")) {
    $row = $result->fetch_row();
    printf("Autocommit is %s\n", $row[0]);
    $result->free();
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}
```

```

}

/* turn autocommit on */
mysqli_autocommit($link, TRUE);

if ($result = mysqli_query($link, "SELECT @@autocommit")) {
    $row = mysqli_fetch_row($result);
    printf("Autocommit is %s\n", $row[0]);
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Autocommit is 1
```

[mysqli_commit](#)
[mysqli_rollback](#)

22.10.2.7.3. `mysqli::change_user`, `mysqli_change_user`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::change_user](#)
- [mysqli_change_user](#)

Changes the user of the specified database connection

Description

Object oriented style

```
bool mysqli::change_user(string user,
                         string password,
                         string database);
```

Procedural style

```
bool mysqli_change_user(mysqli link,
                        string user,
                        string password,
                        string database);
```

Changes the user of the specified database connection and sets the current database.

In order to successfully change users a valid `username` and `password` parameters must be provided and that user must have sufficient permissions to access the desired database. If for any reason authorization fails, the current user authentication will remain.

Parameters

<code>link</code>	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
<code>user</code>	The MySQL user name.
<code>password</code>	The MySQL password.

database

The database to change to.

If desired, the `NULL` value may be passed resulting in only changing the user and not selecting a database. To select a database in this case use the `mysqli_select_db` function.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes**Note**

Using this command will always cause the current database connection to behave as if it was a completely new database connection, regardless of if the operation was completed successfully. This reset includes performing a rollback on any active transactions, closing all temporary tables, and unlocking all locked tables.

Examples**Example 22.72. `mysqli::change_user` example**

Object oriented style

```
<?php
/* connect database test */
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* Set Variable a */
$mysqli->query("SET @a:=1");

/* reset all and select a new database */
$mysqli->change_user("my_user", "my_password", "world");

if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database: %s\n", $row[0]);
    $result->close();
}

if ($result = $mysqli->query("SELECT @a")) {
    $row = $result->fetch_row();
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
/* connect database test */
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Set Variable a */
mysqli_query($link, "SET @a:=1");

/* reset all and select a new database */
mysqli_change_user($link, "my_user", "my_password", "world");

if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database: %s\n", $row[0]);
```

```

    mysqli_free_result($result);
}

if ($result = mysqli_query($link, "SELECT @a")) {
    $row = mysqli_fetch_row($result);
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Default database: world
Value of variable a is NULL

```

- [mysqli::character_set_name](#)
- [mysqli_character_set_name](#)

Returns the default character set for the database connection

Description

Object oriented style

```
string mysqli::character_set_name();
```

Procedural style

```
string mysqli_character_set_name(mysqli link);
```

Returns the current character set for the database connection.

Parameters

link

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

The default character set for the current connection

Examples

Example 22.73. `mysqli::character_set_name` example

Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

/* Print current character set */
$charset = $mysqli->character_set_name();
printf ("Current character set is %s\n", $charset);

$mysqli->close();
?>
```

Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Print current character set */
$charset = mysqli_character_set_name($link);
printf ("Current character set is %s\n", $charset);

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Current character set is latin1_swedish_ci
```

Returns the MySQL client version as a string

Description

Object oriented style

```
mysqli {
    string client_info ;
}
```

Procedural style

```
string mysqli_get_client_info(mysqli link);
```

Returns a string that represents the MySQL client library version.

Return Values

A string that represents the MySQL client library version

Examples

Example 22.74. mysqli_get_client_info

```
<?php  
/* We don't need a connection to determine  
   the version of mysql client library */  
printf("Client library version: %s\n", mysqli_get_client_info());  
?>
```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->client_version](#)
[mysqli_get_client_version](#)

Get MySQL client info

Description

Object oriented style

```
mysqli {  
    int client_version ;  
}
```

Procedural style

```
int mysqli_get_client_version(mysqli link);
```

Returns client version number as an integer.

Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exists.

Examples

Example 22.75. mysqli_get_client_version

```
<?php
/* We don't need a connection to determine
   the version of mysql client library */
printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

22.10.2.7.8. mysqli::commit, mysqli_commit

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::commit`

`mysqli_commit`

Commits the current transaction

Description

Object oriented style

```
bool mysqli::commit();
```

Procedural style

```
bool mysqli_commit(mysqli link);
```

Commits the current transaction for the database connection.

Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.76. `mysqli::commit` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE Language LIKE CountryLanguage");

/* set autocommit to off */
$mysqli->autocommit(FALSE);

/* Insert some values */
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
$mysqli->commit();

/* drop table */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* set autocommit to off */
```

```

mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE Language LIKE CountryLanguage");

/* Insert some values */
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
mysqli_commit($link);

/* close connection */
mysqli_close($link);
?>

```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->connect_errno](#)
- [mysqli_connect_errno](#)

Returns the error code from last connect call

Description

Object oriented style

```

mysqli {
    string connect_errno ;
}

```

Procedural style

```
int mysqli_connect_errno();
```

Returns the last error code number from the last call to [mysqli_connect](#).

Note

Client error message numbers are listed in the MySQL `errmsg.h` header file, server error message numbers are listed in `mysqld_error.h`. In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Return Values

An error code value for the last call to [mysqli_connect](#), if it failed. zero means no error occurred.

Examples

Example 22.77. `mysqli->connect_errno` example

Object oriented style

```

<?php
$mysqli = @new mysqli('localhost', 'fake_user', 'my_password', 'my_db');

if ($mysqli->connect_errno) {
    die('Connect Error: ' . $mysqli->connect_errno);
}
?>

```

Procedural style

```
<?php
$link = @mysqli_connect('localhost', 'fake_user', 'my_password', 'my_db');

if (!$link) {
    die('Connect Error: ' . mysqli_connect_errno());
}
?>
```

The above examples will output:

```
Connect Error: 1045
```

See Also

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->connect_error](#)
[mysqli_connect_error](#)

Returns a string description of the last connect error

Description

Object oriented style

```
mysqli {
    string connect_error ;
}
```

Procedural style

```
string mysqli_connect_error();
```

Returns the last error message string from the last call to [mysqli_connect](#).

Return Values

A string that describes the error. [NULL](#) is returned if no error occurred.

Examples

Example 22.78. `mysqli->connect_error` example

Object oriented style

```
<?php
$mysqli = @new mysqli('localhost', 'fake_user', 'my_password', 'my_db');

// Works as of PHP 5.2.9 and 5.3.0.
if ($mysqli->connect_error) {
    die('Connect Error: ' . $mysqli->connect_error);
}
?>
```

Procedural style

```
<?php
$link = @mysqli_connect('localhost', 'fake_user', 'my_password', 'my_db');

if (!$link) {
    die('Connect Error: ' . mysqli_connect_error());
}
?>
```

The above examples will output:

```
Connect Error: Access denied for user 'fake_user'@'localhost' (using password: YES)
```

Notes

Warning

The `mysqli->connect_error` property only works properly as of PHP versions 5.2.9 and 5.3.0. Use the `mysqli_connect_error` function if compatibility with earlier PHP versions is required.

22.10.2.7.11. `mysqli::__construct`, `mysqli_connect`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::__construct](#)

[mysqli_connect](#)

Open a new connection to the MySQL server

Description

Object oriented style

```
mysqli::__construct(string host= ini_get("mysqli.default_host"),
                    string username= ini_get("mysqli.default_user"),
                    string passwd= ini_get("mysqli.default_pw"),
                    string dbname= "",
                    int port= ini_get("mysqli.default_port"),
                    string socket= ini_get("mysqli.default_socket"));
```

Procedural style

```
mysqli mysqli_connect(string host= ini_get("mysqli.default_host"),
```

```

    string username= =ini_get("mysqli.default_user"),
    string passwd= =ini_get("mysqli.default_pw"),
    string dbname= "",
    int port= =ini_get("mysqli.default_port"),
    string socket= =ini_get("mysqli.default_socket"));

```

Opens a connection to the MySQL Server running on.

Parameters

<code>host</code>	Can be either a host name or an IP address. Passing the <code>NULL</code> value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.
<code>port</code>	Prepending host by <code>p</code> : opens a persistent connection. <code>mysqli_change_user</code> is automatically called on connections opened from the connection pool.
<code>username</code>	The MySQL user name.
<code>passwd</code>	If not provided or <code>NULL</code> , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
<code>dbname</code>	If provided will specify the default database to be used when performing queries.
<code>socket</code>	Specifies the port number to attempt to connect to the MySQL server.
<code>socket</code>	Specifies the socket or named pipe that should be used.

Note

Specifying the `socket` parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the `host` parameter.

Return Values

Returns an object which represents the connection to a MySQL Server.

Changelog

Version	Description
5.3.0	Added the ability of persistent connections.

Examples

Example 22.79. `mysqli::__construct` example

Object oriented style

```

<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'my_db');

/*
 * This is the "official" OO way to do it,
 * BUT $connect_error was broken until PHP 5.2.9 and 5.3.0.
 */
if ($mysqli->connect_error) {
    die('Connect Error (' . $mysqli->connect_errno . ') '
        . $mysqli->connect_error);
}

/*
 * Use this instead of $connect_error if you need to ensure
 * compatibility with PHP versions prior to 5.2.9 and 5.3.0.
 */
if (mysqli_connect_error()) {
    die('Connect Error (' . mysqli_connect_errno() . ') '
        . mysqli_connect_error());
}

```

```

echo 'Success... ' . $mysqli->host_info . "\n";
$mysqli->close();
?>

```

Object oriented style when extending mysqli class

```

<?php

class foo_mysqli extends mysqli {
    public function __construct($host, $user, $pass, $db) {
        parent::__construct($host, $user, $pass, $db);

        if (mysqli_connect_error()) {
            die('Connect Error (' . mysqli_connect_errno() . ') '
                . mysqli_connect_error());
        }
    }

$db = new foo_mysqli('localhost', 'my_user', 'my_password', 'my_db');

echo 'Success... ' . $db->host_info . "\n";

$db->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'my_db');

if (!$link) {
    die('Connect Error (' . mysqli_connect_errno() . ') '
        . mysqli_connect_error());
}

echo 'Success... ' . mysqli_get_host_info($link) . "\n";

mysqli_close($link);
?>

```

The above examples will output:

```
Success... MySQL host info: localhost via TCP/IP
```

Notes

Note

MySQLnd always assumes the server default charset. This charset is sent during connection hand-shake/authentication, which mysqlnd will use.

Libmysql uses the default charset set in the `my.cnf` or by an explicit call to `mysqli_options` prior to calling `mysqli_real_connect`, but after `mysqli_init`.

Note

OO syntax only: If a connection fails an object is still returned. To check if the connection failed then use either the `mysqli_connect_error` function or the `mysqli->connect_error` property as in the preceding examples.

Note

If it is necessary to set options, such as the connection timeout, `mysqli_real_connect` must be used instead.

Note

Calling the constructor with no parameters is the same as calling `mysqli_init`.

Note

Error "Can't create TCP/IP socket (10106)" usually means that the `variables_order` configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

22.10.2.7.12. `mysqli::debug`, `mysqli_debug`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::debug`
- `mysqli_debug`

Performs debugging operations

Description

Object oriented style

```
bool mysqli::debug(string message);
```

Procedural style

```
bool mysqli_debug(string message);
```

Performs debugging operations using the Fred Fish debugging library.

Parameters

`message`

A string representing the debugging operation to perform

Return Values

Returns `TRUE`.

Notes

Note

To use the `mysqli_debug` function you must compile the MySQL client library to support debugging.

Examples

Example 22.80. Generating a Trace File

```
<?php
/* Create a trace file in '/tmp/client.trace' on the local (client) machine: */
mysqli_debug("d:t:o,/tmp/client.trace");
?>
```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::dump_debug_info](#)
[mysqli_dump_debug_info](#)

Dump debugging information into the log

Description

Object oriented style

```
bool mysqli::dump_debug_info();
```

Procedural style

```
bool mysqli_dump_debug_info(mysqli link);
```

This function is designed to be executed by an user with the SUPER privilege and is used to dump debugging information into the log for the MySQL Server relating to the connection.

Parameters

link

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

See Also

[mysqli_debug](#)

22.10.2.7.14. mysqli->errno, mysqli_errno

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->errno](#)
[mysqli_errno](#)

Returns the error code for the most recent function call

Description

Object oriented style

```
mysqli {
    int errno ;
}
```

Procedural style

```
int mysqli_errno(mysqli link);
```

Returns the last error code for the most recent MySQLi function call that can succeed or fail.

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
----------------------	--

Return Values

An error code value for the last call, if it failed. zero means no error occurred.

Examples

Example 22.81. [mysqli->errno](#) example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error);
    exit();
}

if (!$link->query("SET a=1")) {
    printf("Errorcode: %d\n", $link->errno);
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!mysqli_query($link, "SET a=1")) {
    printf("Errorcode: %d\n", mysqli_errno($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Errorcode: 1193
```

- `mysqli->error`
- `mysqli_error`

Returns a string description of the last error

Description

Object oriented style

```
mysqli {
    string error ;
}
```

Procedural style

```
string mysqli_error(mysqli link);
```

Returns the last error message for the most recent MySQLi function call that can succeed or fail.

Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 22.82. mysqli->error example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!$link->query("SET a=1")) {
    printf("Errormessage: %s\n", $link->error);
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
```

```

    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!mysqli_query($link, "SET a=1")) {
    printf("Errormessage: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Errormessage: Unknown system variable 'a'
```

22.10.2.7.16. `mysqli->field_count`, `mysqli_field_count`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->field_count](#)
- [mysqli_field_count](#)

Returns the number of columns for the most recent query

Description

Object oriented style

```

mysqli_result {
    int field_count ;
}

```

Procedural style

```
int mysqli_field_count(mysqli link);
```

Returns the number of columns for the most recent query on the connection represented by the `link` parameter. This function can be useful when using the [mysqli_store_result](#) function to determine if the query should have produced a non-empty result set or not without knowing the nature of the query.

Parameters

`link`

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

An integer representing the number of fields in a result set.

Examples

Example 22.83. mysqli->field_count example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query( "DROP TABLE IF EXISTS friends");
$mysqli->query( "CREATE TABLE friends (id int, name varchar(20))");

$mysqli->query( "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$mysqli->real_query("SELECT * FROM friends");

if ($mysqli->field_count) {
    /* this was a select/show or describe query */
    $result = $mysqli->store_result();

    /* process resultset */
    $row = $result->fetch_row();

    /* free resultset */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

mysqli_real_query($link, "SELECT * FROM friends");

if (mysqli_field_count($link)) {
    /* this was a select/show or describe query */
    $result = mysqli_store_result($link);

    /* process resultset */
    $row = mysqli_fetch_row($result);

    /* free resultset */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

22.10.2.7.17. mysqli::get_charset, mysqli_get_charset

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::get_charset`

`mysqli_get_charset`

Returns a character set object

Description

Object oriented style

```
object mysqli::get_charset();
```

Procedural style

```
object mysqli_get_charset(mysqli link);
```

Returns a character set object providing several properties of the current active character set.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
-------------	--

Return Values

The function returns a character set object with the following properties:

<i>charset</i>	Character set name
<i>collation</i>	Collation name
<i>dir</i>	Directory the charset description was fetched from (?) or "" for built-in character sets
<i>min_length</i>	Minimum character length in bytes
<i>max_length</i>	Maximum character length in bytes
<i>number</i>	Internal character set number
<i>state</i>	Character set status (?)

Examples

Example 22.84. `mysqli::get_charset` example

Object oriented style

```
<?php
$db = mysqli_init();
$db->real_connect("localhost", "root", "", "test");
var_dump($db->get_charset());
?>
```

Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost", "root", "", "test");
var_dump($db->get_charset());
?>
```

The above examples will output:

```
object(stdClass)#2 (7) {
["charset"]=>
string(6) "latin1"
["collation"]=>
string(17) "latin1_swedish_ci"
["dir"]=>

22.10.2.7.18. `mysqli->get_client_info`, `mysqli_get_client_info`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->get_client_info](#)

[mysqli_get_client_info](#)

Returns the MySQL client version as a string

Description

Object oriented style

```
string mysqli::get_client_info();
```

Procedural style

```
string mysqli_get_client_info(mysqli link);
```

Returns a string that represents the MySQL client library version.

Return Values

A string that represents the MySQL client library version

Examples

Example 22.85. `mysqli_get_client_info`

```
<?php
/* We don't need a connection to determine
   the version of mysql client library */
printf("Client library version: %s\n", mysqli_get_client_info());
?>
```

22.10.2.7.19. `mysqli_get_client_stats`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_get_client_stats](#)

Returns client per-process statistics

Description

```
array mysqli_get_client_stats();
```

Returns client per-process statistics. Available only with [mysqlnd](#).

Parameters

Return Values

Returns an array with client stats if success, [FALSE](#) otherwise.

Examples

Example 22.86. A `mysqli_get_client_stats` example

```
<?php
$link = mysqli_connect();
print_r(mysqli_get_client_stats());
?>
```

The above example will output something similar to:

```

Copyright 1997-2010 the PHP Documentation Group.

- [`mysqli->client_version`](#)
- [`mysqli_get_client_version`](#)

Get MySQL client info

Description

Object oriented style

```
mysqli {
    int client_version ;
}
```

Procedural style

```
int mysqli_get_client_version(mysqli link);
```

Returns client version number as an integer.

Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exists.

Examples

Example 22.87. mysqli_get_client_version

```
<?php
/* We don't need a connection to determine
   the version of mysql client library */
printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

22.10.2.7.22. `mysqli->host_info`, `mysqli_get_host_info`

Copyright 1997-2010 the PHP Documentation Group.

- [`mysqli->host_info`](#)
- [`mysqli_get_host_info`](#)

Returns a string representing the type of connection used

Description

Object oriented style

```
mysqli {
    string host_info ;
}
```

Procedural style

```
string mysqli_get_host_info(mysqli link);
```

Returns a string describing the connection represented by the `link` parameter (including the server host name).

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A character string representing the server hostname and the connection type.

Examples

Example 22.89. `mysqli->host_info` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* print host information */
printf("Host info: %s\n", $mysqli->host_info);

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* print host information */
printf("Host info: %s\n", mysqli_get_host_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Host info: Localhost via UNIX socket
```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->protocol_version](#)

[mysqli_get_proto_info](#)

Returns the version of the MySQL protocol used

Description

Object oriented style

```
mysqli {
    string protocol_version ;
}
```

Procedural style

```
int mysqli_get_proto_info(mysqli link);
```

Returns an integer representing the MySQL protocol version used by the connection represented by the [Link](#) parameter.

Parameters

[link](#)

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns an integer representing the protocol version.

Examples

Example 22.90. `mysqli->protocol_version` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");
/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}
/* print protocol version */
printf("Protocol version: %d\n", $mysqli->protocol_version);
/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");
/* check connection */
```

```

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print protocol version */
printf("Protocol version: %d\n", mysqli_get_proto_info($link));

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Protocol version: 10
```

Returns the version of the MySQL server

Description

Object oriented style

```

mysqli {
    string server_info ;
}
```

Procedural style

```
string mysqli_get_server_info(mysqli link);
```

Returns a string representing the version of the MySQL server that the MySQLi extension is connected to.

Parameters

`link`

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

A character string representing the server version.

Examples

Example 22.91. `mysqli->server_info` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", $mysqli->server_info);

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", mysqli_get_server_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Server version: 4.1.2-alpha-debug
```

- [mysqli->server_version](#)
- [mysqli_get_server_version](#)

Returns the version of the MySQL server as an integer

Description

Object oriented style

```
mysqli {
    int server_version ;
}
```

Procedural style

```
int mysqli_get_server_version(mysqli link);
```

The `mysqli_get_server_version` function returns the version of the server connected to (represented by the `link` parameter) as an integer.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An integer representing the server version.

The form of this version number is `main_version * 10000 + minor_version * 100 + sub_version` (i.e. version 4.1.0 is 40100).

Examples

Example 22.92. `mysqli->server_version` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", $mysqli->server_version);

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", mysqli_get_server_version($link));

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Server version: 40102
```

22.10.2.7.26. mysqli::get_warnings, mysqli_get_warnings

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::get_warnings`

```
mysqli_get_warnings
```

Get result of SHOW WARNINGS

Description

Object oriented style

```
mysqli_warning mysqli::get_warnings();
```

Procedural style

```
mysqli_warning mysqli_get_warnings(mysqli link);
```

Warning

This function is currently not documented; only its argument list is available.

22.10.2.7.27. mysqli->info, mysqli_info

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->info`

```
mysqli_info
```

Retrieves information about the most recently executed query

Description

Object oriented style

```
mysqli {
    string info ;
}
```

Procedural style

```
string mysqli_info(mysqli link);
```

The `mysqli_info` function returns a string providing information about the last query executed. The nature of this string is provided below:

Table 22.9. Possible mysqli_info return values

Query type	Example result string
INSERT INTO...SELECT...	Records: 100 Duplicates: 0 Warnings: 0
INSERT INTO...VALUES (...),(...),(...)	Records: 3 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...	Records: 1 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE ...	Records: 3 Duplicates: 0 Warnings: 0
UPDATE ...	Rows matched: 40 Changed: 40 Warnings: 0

Note

Queries which do not fall into one of the preceding formats are not supported. In these situations, `mysqli_info` will return an empty string.

Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
-------------------	--

Return Values

A character string representing additional information about the most recently executed query.

Examples**Example 22.93. `mysqli->info` example**

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
$link->query("INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", $link->info);

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
mysqli_query($link, "INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", mysqli_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Records: 150  Duplicates: 0  Warnings: 0
```

22.10.2.7.28. [mysqli::init](#), [mysqli_init](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::init](#)
[mysqli_init](#)

Initializes MySQLi and returns a resource for use with [mysqli_real_connect\(\)](#)

Description

Object oriented style

```
mysqli mysqli::init();
```

Procedural style

```
mysqli mysqli_init();
```

Allocates or initializes a MySQL object suitable for [mysqli_options](#) and [mysqli_real_connect](#).

Note

Any subsequent calls to any mysqli function (except [mysqli_options](#)) will fail until [mysqli_real_connect](#) was called.

Return Values

Returns an object.

Examples

22.10.2.7.29. [mysqli->insert_id](#), [mysqli_insert_id](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->insert_id](#)
[mysqli_insert_id](#)

Returns the auto generated id used in the last query

Description

Object oriented style

```
mysqli {  
    mixed insert_id;  
}
```

Procedural style

```
mixed mysqli_insert_id(mysqli link);
```

The `mysqli_insert_id` function returns the ID generated by a query on a table with a column having the `AUTO_INCREMENT` attribute. If the last query wasn't an `INSERT` or `UPDATE` statement or if the modified table does not have a column with the `AUTO_INCREMENT` attribute, this function will return zero.

Note

Performing an `INSERT` or `UPDATE` statement using the `LAST_INSERT_ID()` function will also modify the value returned by the `mysqli_insert_id` function.

Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The value of the `AUTO_INCREMENT` field that was updated by the previous query. Returns zero if there was no previous query on the connection or if the query did not update an `AUTO_INCREMENT` value.

Note

If the number is greater than maximal int value, `mysqli_insert_id` will return a string.

Examples

Example 22.94. `mysqli->insert_id` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error());
    exit();
}

$link->query("CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
$link->query($query);

printf ("New Record has id %d.\n", $link->insert_id);

/* drop table */
$link->query("DROP TABLE myCity");

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
mysqli_query($link, $query);

printf ("New Record has id %d.\n", mysqli_insert_id($link));
```

```
/* drop table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
New Record has id 1.
```

22.10.2.7.30. `mysqli::kill`, `mysqli_kill`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::kill`

- `mysqli_kill`

Asks the server to kill a MySQL thread

Description

Object oriented style

```
bool mysqli::kill(int processid);
```

Procedural style

```
bool mysqli_kill(mysqli link,
                 int processid);
```

This function is used to ask the server to kill a MySQL thread specified by the `processid` parameter. This value must be retrieved by calling the `mysqli_thread_id` function.

To stop a running query you should use the SQL command `KILL QUERY processid`.

Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.95. `mysqli::kill` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit();
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Error: MySQL server has gone away
```

See Also

[mysqli_thread_id](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::more_results](#)

[mysqli_more_results](#)

Check if there are any more query results from a multi query

Description

Object oriented style

```
bool mysqli::more_results();
```

Procedural style

```
bool mysqli_more_results(mysqli link);
```

Indicates if one or more result sets are available from a previous call to [mysqli_multi_query](#).

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

See [mysqli_multi_query](#).

See Also

[mysqli_multi_query](#)
[mysqli_next_result](#)
[mysqli_store_result](#)
[mysqli_use_result](#)

22.10.2.7.32. [mysqli::multi_query](#), [mysqli_multi_query](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::multi_query](#)
[mysqli_multi_query](#)

Performs a query on the database

Description

Object oriented style

```
bool mysqli::multi_query(string query);
```

Procedural style

```
bool mysqli_multi_query(mysqli link,  
                        string query);
```

Executes one or multiple queries which are concatenated by a semicolon.

To retrieve the resultset from the first query you can use [mysqli_use_result](#) or [mysqli_store_result](#). All subsequent query results can be processed using [mysqli_more_results](#) and [mysqli_next_result](#).

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

query The query, as a string.

Data inside the query should be [properly escaped](#).

Return Values

Returns [FALSE](#) if the first statement failed. To retrieve subsequent errors from other statements you have to call

`mysqli_next_result` first.

Examples

Example 22.96. `mysqli::multi_query` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->store_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->free();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_store_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----\n");
        }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output something similar to:

```
my_user@localhost
-----
```

```
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer
```

22.10.2.7.33. `mysqli::next_result`, `mysqli_next_result`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::next_result](#)

[mysqli_next_result](#)

Prepare next result from multi_query

Description

Object oriented style

```
bool mysqli::next_result();
```

Procedural style

```
bool mysqli_next_result(mysqli link);
```

Prepares next result set from a previous call to [mysqli_multi_query](#) which can be retrieved by [mysqli_store_result](#) or [mysqli_use_result](#).

Parameters

link

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

See [mysqli_multi_query](#).

22.10.2.7.34. `mysqli::options`, `mysqli_options`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::options](#)

mysqli_options

Set options

Description

Object oriented style

```
bool mysqli::options(int option,
                      mixed value);
```

Procedural style

```
bool mysqli_options(mysqli link,
                     int option,
                     mixed value);
```

Used to set extra connect options and affect behavior for a connection.

This function may be called multiple times to set several options.

`mysqli_options` should be called after `mysqli_init` and before `mysqli_real_connect`.

Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>option</code>	The option that you want to set. It can be one of the following values:

Table 22.10. Valid options

Name	Description
<code>MYSQLI_OPT_CONNECT_TIMEOUT</code>	connection timeout in seconds (supported on Windows with TCP/IP since PHP 5.3.1)
<code>MYSQLI_OPT_LOCAL_INFILE</code>	enable/disable use of <code>LOAD LOCAL INFILE</code>
<code>MYSQLI_INIT_COMMAND</code>	command to execute after when connecting to MySQL server
<code>MYSQLI_READ_DEFAULT_FILE</code>	Read options from named option file instead of <code>my.cnf</code>
<code>MYSQLI_READ_DEFAULT_GROUP</code>	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQL_READ_DEFAULT_FILE</code> .

<code>value</code>	The value for the option.
--------------------	---------------------------

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_real_connect`.

Notes**Note**

MySQLnd always assumes the server default charset. This charset is sent during connection handshake/authentication, which mysqld will use.

Libmysql uses the default charset set in the `my.cnf` or by an explicit call to `mysqli_options` prior to calling `mysqli_real_connect`, but after `mysqli_init`.

mysqli_init
mysqli_real_connect
```

22.10.2.7.35. mysqli::ping, mysqli_ping

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::ping](#)

[mysqli_ping](#)

Pings a server connection, or tries to reconnect if the connection has gone down

Description

Object oriented style

```
bool mysqli::ping();
```

Procedural style

```
bool mysqli_ping(mysqli link);
```

Checks whether the connection to the server is working. If it has gone down, and global option [mysqli.reconnect](#) is enabled an automatic reconnection is attempted.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and re-connect if necessary.

Parameters

link

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 22.97. mysqli::ping example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}
/* check if server is alive */
if ($mysqli->ping()) {
    printf ("Our connection is ok!\n");
} else {
    printf ("Error: %s\n", $mysqli->error);
}
/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
```

```

$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* check if server is alive */
if (mysqli_ping($link)) {
    printf ("Our connection is ok!\n");
} else {
    printf ("Error: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Our connection is ok!
```

22.10.2.7.36. `mysqli::poll`, `mysqli_poll`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::poll`

`mysqli_poll`

Poll connections

Description

Object oriented style

```
public int mysqli::poll(array read,
                       array error,
                       array reject,
                       int sec,
                       int usec);
```

Procedural style

```
int mysqli_poll(array read,
                array error,
                array reject,
                int sec,
                int usec);
```

Warning

This function is currently not documented; only its argument list is available.

Poll connections. Available only with `mysqlnd`.

Parameters

`read`
`error`
`reject`
`sec`

Number of seconds to wait, must be non-negative.

`usec`

Number of microseconds to wait, must be non-negative.

Return Values

Returns number of ready connections in success, `FALSE` otherwise.

Examples

Example 22.98. A `mysqli_poll` example

```
<?php
$link1 = mysqli_connect();
$link1->query("SELECT 'test'", MYSQLI_ASYNC);
$all_links = array($link1);
$processed = 0;
do {
    $links = $errors = $reject = array();
    foreach ($all_links as $link) {
        $links[] = $errors[] = $reject[] = $link;
    }
    if (!mysqli_poll($links, $errors, $reject, 1)) {
        continue;
    }
    foreach ($links as $link) {
        if ($result = $link->reap_async_query()) {
            print_r($result->fetch_row());
            mysqli_free_result($result);
            $processed++;
        }
    }
} while ($processed < count($all_links));
?>
```

The above example will output:

```
Array
(
    [0] => test
)
```

See Also

[mysqli_query](#)
[mysqli_reap_async_query](#)

22.10.2.7.37. `mysqli::prepare`, `mysqli_prepare`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::prepare](#)
[mysqli_prepare](#)
 Prepare an SQL statement for execution

Description

Object oriented style

```
mysqli_stmt mysqli::prepare(string query);
```

Procedural style

```
mysqli_stmt mysqli_prepare(mysqli link,
                           string query);
```

Prepares the SQL query, and returns a statement handle to be used for further operations on the statement. The query must consist of a single SQL statement.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>query</code>	The query, as a string.

Note

You should not add a terminating semicolon or `\g` to the statement.

This parameter can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a `SELECT` statement, or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. It's not allowed to compare marker with `NULL` by ? `IS NULL` too. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

`mysqli_prepare` returns a statement object or `FALSE` if an error occurred.

Examples

Example 22.99. `mysqli::prepare` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error);
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = $mysqli->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
```

```
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
$city = "Amersfoort";
/* create a prepared statement */
if ($stmt = mysqli_prepare($link, "SELECT District FROM City WHERE Name=?")) {
    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $district);

    /* fetch value */
    mysqli_stmt_fetch($stmt);
    printf("%s is in district %s\n", $city, $district);
    /* close statement */
    mysqli_stmt_close($stmt);
}
/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Amersfoort is in district Utrecht
```

22.10.2.7.38. `mysqli::query`, `mysqli_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::query](#)

[mysqli_query](#)

Performs a query on the database

Description

Object oriented style

```
mixed mysqli::query(string query,
```

```
int resultmode);
```

Procedural style

```
mixed mysqli_query(mysqli link,
                  string query,
                  int resultmode);
```

Performs a [query](#) against the database.

Functionally, using this function is identical to calling [mysqli_real_query](#) followed either by [mysqli_use_result](#) or [mysqli_store_result](#).

Note

In the case where you pass a statement to [mysqli_query](#) that is longer than [max_allowed_packet](#) of the server, the returned error codes are different depending on whether you are using MySQL Native Driver ([mysqlnd](#)) or MySQL Client Library ([libmysql](#)). The behavior is as follows:

- [mysqlnd](#) on Linux returns an error code of 1153. The error message means “got a packet bigger than [max_allowed_packet](#) bytes”.
- [mysqlnd](#) on Windows returns an error code 2006. This error message means “server has gone away”.
- [libmysql](#) on all platforms returns an error code 2006. This error message means “server has gone away”.

Parameters

link	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
query	The query string. Data inside the query should be properly escaped .
resultmode	Either the constant MYSQLI_USE_RESULT or MYSQLI_STORE_RESULT depending on the desired behavior. By default, MYSQLI_STORE_RESULT is used. If you use MYSQLI_USE_RESULT all subsequent calls will return error Commands out of sync unless you call mysqli_free_result
	With MYSQLI_ASYNC (available with mysqlnd), it is possible to perform query asynchronously. mysqli_poll is then used to get results from such queries.

Return Values

Returns [FALSE](#) on failure. For successful [SELECT](#), [SHOW](#), [DESCRIBE](#) or [EXPLAIN](#) queries [mysqli_query](#) will return a result object. For other successful queries [mysqli_query](#) will return [TRUE](#).

Changelog

Version	Description
5.3.0	Added the ability of async queries.

Examples

Example 22.100. [mysqli::query](#) example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
```

```

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if ($mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = $mysqli->query("SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", $result->num_rows);

    /* free result set */
    $result->close();
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = $mysqli->query("SELECT * FROM City", MYSQLI_USE_RESULT)) {

    /* Note, that we can't execute any functions which interact with the
       server until result set was closed. All calls will return an
       'out of sync' error */
    if (!$mysqli->query("SET @a:='this will not work'")) {
        printf("Error: %s\n", $mysqli->error);
    }
    $result->close();
}

$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if (mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = mysqli_query($link, "SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", mysqli_num_rows($result));

    /* free result set */
    mysqli_free_result($result);
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = mysqli_query($link, "SELECT * FROM City", MYSQLI_USE_RESULT)) {

    /* Note, that we can't execute any functions which interact with the
       server until result set was closed. All calls will return an
       'out of sync' error */
    if (!mysqli_query($link, "SET @a:='this will not work'")) {
        printf("Error: %s\n", mysqli_error($link));
    }
    mysqli_free_result($result);
}

mysqli_close($link);
?>

```

The above examples will output:

```

Table myCity successfully created.
Select returned 10 rows.
Error: Commands out of sync; You can't run this command now

```

22.10.2.7.39. `mysqli::real_connect`, `mysqli_real_connect`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::real_connect`

```
mysqli_real_connect
```

Opens a connection to a mysql server

Description

Object oriented style

```
bool mysqli::real_connect(string host,
                           string username,
                           string passwd,
                           string dbname,
                           int port,
                           string socket,
                           int flags);
```

Procedural style

```
bool mysqli_real_connect(mysqli link,
                         string host,
                         string username,
                         string passwd,
                         string dbname,
                         int port,
                         string socket,
                         int flags);
```

Establish a connection to a MySQL database engine.

This function differs from `mysqli_connect`:

- `mysqli_real_connect` needs a valid object which has to be created by function `mysqli_init`.
- With the `mysqli_options` function you can set various options for connection.
- There is a `flags` parameter.

Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<code>host</code>	Can be either a host name or an IP address. Passing the <code>NULL</code> value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.
<code>username</code>	The MySQL user name.
<code>passwd</code>	If provided or <code>NULL</code> , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
<code>dbname</code>	If provided will specify the default database to be used when performing queries.
<code>port</code>	Specifies the port number to attempt to connect to the MySQL server.
<code>socket</code>	Specifies the socket or named pipe that should be used.

Note

Specifying the `socket` parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the `host` parameter.

flags

With the parameter `flags` you can set different connection options:

Table 22.11. Supported flags

Name	Description
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQLI_CLIENT_FOUND_ROWS</code>	return number of matched rows, not the number of affected rows
<code>MYSQLI_CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all function names reserved words.
<code>MYSQLI_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encryption)

Note

For security reasons the `MULTI_STATEMENT` flag is not supported in PHP. If you want to execute multiple queries use the `mysqli_multi_query` function.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 22.101. `mysqli::real_connect` example**

Object oriented style

```
<?php
$mysqli = mysqli_init();
if (! $mysqli) {
    die('mysqli_init failed');
}

if (! $mysqli->options(MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
    die('Setting MYSQLI_INIT_COMMAND failed');
}

if (! $mysqli->options(MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
    die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
}

if (! $mysqli->real_connect('localhost', 'my_user', 'my_password', 'my_db')) {
    die('Connect Error (' . mysqli_connect_errno() . ') '
        . mysqli_connect_error());
}

echo 'Success... ' . $mysqli->host_info . "\n";
$mysqli->close();
?>
```

Object oriented style when extending mysqli class

```
<?php
class foo_mysqli extends mysqli {
    public function __construct($host, $user, $pass, $db) {
        parent::__construct($host, $user, $pass, $db);
        if (!parent::__construct(MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
```

```

        die('Setting MYSQLI_INIT_COMMAND failed');
    }

    if (!parent::options(MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
        die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
    }

    if (!parent::real_connect($host, $user, $pass, $db)) {
        die('Connect Error (' . mysqli_connect_errno() . ') ' .
            . mysqli_connect_error());
    }
}

$db = new foo_mysqli('localhost', 'my_user', 'my_password', 'my_db');

echo 'Success... ' . $db->host_info . "\n";

$db->close();
?>

```

Procedural style

```

<?php

$link = mysqli_init();
if (!$link) {
    die('mysqli_init failed');
}

if (!mysqli_options($link, MYSQLI_INIT_COMMAND, 'SET AUTOCOMMIT = 0')) {
    die('Setting MYSQLI_INIT_COMMAND failed');
}

if (!mysqli_options($link, MYSQLI_OPT_CONNECT_TIMEOUT, 5)) {
    die('Setting MYSQLI_OPT_CONNECT_TIMEOUT failed');
}

if (!mysqli_real_connect($link, 'localhost', 'my_user', 'my_password', 'my_db')) {
    die('Connect Error (' . mysqli_connect_errno() . ') ' .
        . mysqli_connect_error());
}

echo 'Success... ' . mysqli_get_host_info($link) . "\n";
mysqli_close($link);
?>

```

The above examples will output:

```
Success... MySQL host info: localhost via TCP/IP
```

Notes

Note

MySQLnd always assumes the server default charset. This charset is sent during connection handshake/authentication, which mysqlnd will use.

Libmysql uses the default charset set in the [my.cnf](#) or by an explicit call to [mysqli_options](#) prior to calling [mysqli_real_connect](#), but after [mysqli_init](#).

22.10.2.7.40. mysqli::real_escape_string, mysqli_real_escape_string

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::real_escape_string`

- `mysqli_real_escape_string`

Escapes special characters in a string for use in an SQL statement, taking into account the current charset of the connection

Description

Object oriented style

```
string mysqli::escape_string(string escapestr);
```

```
string mysqli::real_escape_string(string escapestr);
```

Procedural style

```
string mysqli_real_escape_string(mysqli link,
                                    string escapestr);
```

This function is used to create a legal SQL string that you can use in an SQL statement. The given string is encoded to an escaped SQL string, taking into account the current character set of the connection.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

`escapestr` The string to be escaped.

Characters encoded are `NUL (ASCII 0)`, `\n`, `\r`, `\`, `'`, `"`, and `Control-Z`.

Return Values

Returns an escaped string.

Examples

Example 22.102. mysqli::real_escape_string example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!$mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", $mysqli->sqlstate);
}

$city = $mysqli->real_escape_string($city);

/* this query with escaped $city will work */
if ($mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", $mysqli->affected_rows);
}

$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", mysqli_sqlstate($link));
}

$city = mysqli_real_escape_string($link, $city);

/* this query with escaped $city will work */
if (mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", mysqli_affected_rows($link));
}

mysqli_close($link);
?>
```

The above examples will output:

```
Error: 42000
1 Row inserted.
```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::real_query](#)

[mysqli_real_query](#)

Execute an SQL query

Description

Object oriented style

```
bool mysqli::real_query(string query);
```

Procedural style

```
bool mysqli_real_query(mysqli link,
                      string query);
```

Executes a single query against the database whose result can then be retrieved or stored using the [mysqli_store_result](#) or [mysqli_use_result](#) functions.

In order to determine if a given query should return a result set or not, see [mysqli_field_count](#).

Parameters

<code>link</code>	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
<code>query</code>	The query, as a string.
	Data inside the query should be properly escaped .

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

See Also

22.10.2.7.42. `mysqli::reap_async_query`, `mysqli_reap_async_query`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::reap_async_query](#)
[mysqli_reap_async_query](#)

Get result from async query

Description

Object oriented style

```
public mysqli_result mysqli::reap_async_query();
```

Procedural style

```
mysqli_result mysqli_reap_async_query(mysqli link);
```

Warning

This function is currently not documented; only its argument list is available.

Get result from async query. Available only with [mysqlnd](#).

Parameters

<code>link</code>	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
-------------------	--

Return Values

Returns [mysqli_result](#) in success, [FALSE](#) otherwise.

22.10.2.7.43. `mysqli::rollback`, `mysqli_rollback`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::rollback`
`mysqli_rollback`
 Rolls back current transaction

Description

Object oriented style

```
bool mysqli::rollback();
```

Procedural style

```
bool mysqli_rollback(mysqli link);
```

Rollbacks the current transaction for the database.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 22.103. `mysqli::rollback` example**

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* disable autocommit */
$mysqli->autocommit(FALSE);

$mysqli->query("CREATE TABLE myCity LIKE City");
$mysqli->query("ALTER TABLE myCity Type=InnoDB");
$mysqli->query("INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
$mysqli->commit();

/* delete all rows */
$mysqli->query("DELETE FROM myCity");

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Rollback */
$mysqli->rollback();

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
    printf("%d rows in table myCity (after rollback).\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Drop table myCity */
$mysqli->query("DROP TABLE myCity");

$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* disable autocommit */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE myCity LIKE City");
mysqli_query($link, "ALTER TABLE myCity Type=InnoDB");
mysqli_query($link, "INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
mysqli_commit($link);

/* delete all rows */
mysqli_query($link, "DELETE FROM myCity");

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    mysqli_free_result($result);
}

/* Rollback */
mysqli_rollback($link);

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity (after rollback).\n", $row[0]);
    /* Free result */
    mysqli_free_result($result);
}

/* Drop table myCity */
mysqli_query($link, "DROP TABLE myCity");
mysqli_close($link);
?>
```

The above examples will output:

```
0 rows in table myCity.
50 rows in table myCity (after rollback).
```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::select_db](#)

[mysqli_select_db](#)

Selects the default database for database queries

Description

Object oriented style

```
bool mysqli::select_db(string dbname);
```

Procedural style

```
bool mysqli_select_db(mysqli link,
                      string dbname);
```

Selects the default database to be used when performing queries against the database connection.

Note

This function should only be used to change the default database for the connection. You can select the default database with 4th parameter in [mysqli_connect](#).

Parameters

<i>link</i>	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
<i>dbname</i>	The database name.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 22.104. [mysqli::select_db](#) example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

/* change db to world db */
$mysqli->select_db("world");

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* return name of current default database */
```

```

if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

/* change db to world db */
mysqli_select_db($link, "world");

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

mysqli_close($link);
?>

```

The above examples will output:

```

Default database is test.
Default database is world.

```

22.10.2.7.45. `mysqli::set_charset`, `mysqli_set_charset`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::set_charset](#)
[mysqli_set_charset](#)

Sets the default client character set

Description

Object oriented style

```
bool mysqli::set_charset(string charset);
```

Procedural style

```
bool mysqli_set_charset(mysqli link,
                      string charset);
```

Sets the default character set to be used when sending data from and to the database server.

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)
charset The charset to be set as default.

Return Values

Returns **TRUE** on success or **FALSE** on failure.

Notes**Note**

To use this function on a Windows platform you need MySQL client library version 4.1.11 or above (for MySQL 5.0 you need 5.0.6 or above).

Note

This is the preferred way to change the charset. Using `mysqli::query` to execute `SET NAMES ...` is not recommended.

Examples**Example 22.105. `mysqli::set_charset` example**

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

/* change character set to utf8 */
if (!$mysqli->set_charset("utf8")) {
    printf("Error loading character set utf8: %s\n", $mysqli->error);
} else {
    printf("Current character set: %s\n", $mysqli->character_set_name());
}

$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'test');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* change character set to utf8 */
if (!mysqli_set_charset($link, "utf8")) {
    printf("Error loading character set utf8: %s\n", mysqli_error($link));
} else {
    printf("Current character set: %s\n", mysqli_character_set_name($link));

mysqli_close($link);
?>
```

The above examples will output:

```
Current character set: utf8
```

List of character sets that MySQL supports

22.10.2.7.46. `mysqli::set_local_infile_default`, `mysqli_set_local_infile_default`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::set_local_infile_default`
`mysqli_set_local_infile_default`
 Unsets user defined handler for load local infile command

Description

```
void mysqli_set_local_infile_default(mysqli link);
```

Deactivates a `LOAD DATA INFILE LOCAL` handler previously set with `mysqli_set_local_infile_handler`.

Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
-------------------	--

Return Values

No value is returned.

Examples

See `mysqli_set_local_infile_handler` examples

See Also

`mysqli_set_local_infile_handler`

22.10.2.7.47. `mysqli::set_local_infile_handler`, `mysqli_set_local_infile_handler`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli::set_local_infile_handler`
`mysqli_set_local_infile_handler`
 Set callback function for LOAD DATA LOCAL INFILE command

Description

Object oriented style

```
bool mysqli::set_local_infile_handler(mysqli link,
                                       callback read_func);
```

Procedural style

```
bool mysqli_set_local_infile_handler(mysqli link,
                                       callback read_func);
```

Set callback function for LOAD DATA LOCAL INFILE command

The callbacks task is to read input from the file specified in the `LOAD DATA LOCAL INFILE` and to reformat it into the format understood by `LOAD DATA INFILE`.

The returned data needs to match the format specified in the `LOAD DATA`

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>read_func</i>	A callback function or object method taking the following parameters:
<i>stream</i>	A PHP stream associated with the SQL commands INFILE
<i>&buffer</i>	A string buffer to store the rewritten input into
<i>buflen</i>	The maximum number of characters to be stored in the buffer
<i>&errmsg</i>	If an error occurs you can store an error message in here

The callback function should return the number of characters stored in the *buffer* or a negative value if an error occurred.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.106. `mysqli::set_local_infile_handler` example

Object oriented style

```
<?php
$db = mysqli_init();
$db->real_connect("localhost", "root", "", "test");

function callme($stream, &$buffer, $buflen, &$errmsg)
{
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",", "\t", $buffer));

    return strlen($buffer);
}

echo "Input:\n";

$db->set_local_infile_handler("callme");
$db->query("LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
$db->set_local_infile_default();

$res = $db->query("SELECT * FROM t1");

echo "\nResult:\n";
while ($row = $res->fetch_assoc()) {
    echo join(", ", $row)."\n";
}
?>
```

Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost", "root", "", "test");

function callme($stream, &$buffer, $buflen, &$errmsg)
{
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",", "\t", $buffer));

    return strlen($buffer);
}
```

```

echo "Input:\n";
mysqli_set_local_infile_handler($db, "callme");
mysqli_query($db, "LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
mysqli_set_local_infile_default($db);

$res = mysqli_query($db, "SELECT * FROM t1");

echo "\nResult:\n";
while ($row = mysqli_fetch_assoc($res)) {
    echo join(", ", $row)."\n";
}
?>

```

The above examples will output:

```

Input:
23,foo
42,bar

Output:
23,FOO
42,BAR

```

22.10.2.7.48. `mysqli->sqlstate`, `mysqli_sqlstate`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->sqlstate](#)
- [mysqli_sqlstate](#)

Returns the SQLSTATE error from previous MySQL operation

Description

Object oriented style

```

mysqli {
    string sqlstate ;
}

```

Procedural style

```
string mysqli_sqlstate(mysqli link);
```

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for unmapped errors.

Parameters

[link](#) Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

Examples

Example 22.107. `mysqli->sqlstate` example

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error);
    exit();
}

/* Table City already exists, so we should get an error */
if (!$link->query("CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", $link->sqlstate);
}

$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!mysqli_query($link, "CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", mysqli_sqlstate($link));
}

mysqli_close($link);
?>
```

The above examples will output:

```
Error - SQLSTATE 42S01.
```

- [mysqli::ssl_set](#)

mysqli_ssl_set

Used for establishing secure connections using SSL

Description

Object oriented style

```
bool mysqli::ssl_set(string key,  
                      string cert,  
                      string ca,  
                      string capath,  
                      string cipher);
```

Procedural style

```
bool mysqli_ssl_set(mysqli link,  
                     string key,  
                     string cert,  
                     string ca,  
                     string capath,  
                     string cipher);
```

Used for establishing secure connections using SSL. It must be called before [mysqli_real_connect](#). This function does nothing unless OpenSSL support is enabled.

Note that MySQL Native Driver does not support SSL, so calling this function when using MySQL Native Driver will result in an error. MySQL Native Driver is enabled by default on Microsoft Windows from PHP version 5.3 onwards.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by mysqli_connect or mysqli_init
<i>key</i>	The path name to the key file.
<i>cert</i>	The path name to the certificate file.
<i>ca</i>	The path name to the certificate authority file.
<i>capath</i>	The pathname to a directory that contains trusted SSL CA certificates in PEM format.
<i>cipher</i>	A list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as **NULL**

Return Values

This function always returns **TRUE** value. If SSL setup is incorrect [mysqli_real_connect](#) will return an error when you attempt to connect.

22.10.2.7.50. mysqli::stat, mysqli_stat

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::stat](#)
[mysqli_stat](#)

Gets the current system status

Description

Object oriented style

```
string mysqli::stat();
```

Procedural style

```
string mysqli_stat(mysqli link);
```

`mysqli_stat` returns a string containing information similar to that provided by the 'mysqladmin status' command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A string describing the server status. `FALSE` if an error occurred.

Examples

Example 22.108. `mysqli::stat` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

printf ("System status: %s\n", $mysqli->stat());
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("System status: %s\n", mysqli_stat($link));
mysqli_close($link);
?>
```

The above examples will output:

```
System status: Uptime: 272 Threads: 1 Questions: 5340 Slow queries: 0
Opens: 13 Flush tables: 1 Open tables: 0 Queries per second avg: 19.632
Memory in use: 8496K Max memory used: 8560K
```

22.10.2.7.51. `mysqli::stmt_init`, `mysqli_stmt_init`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::stmt_init](#)

[mysqli_stmt_init](#)

Initializes a statement and returns an object for use with `mysqli_stmt_prepare`

Description

Object oriented style

```
mysqli_stmt mysqli::stmt_init();
```

Procedural style

```
mysqli_stmt mysqli_stmt_init(mysqli link);
```

Allocates and initializes a statement object suitable for [mysqli_stmt_prepare](#).

Note

Any subsequent calls to any `mysqli_stmt` function will fail until [mysqli_stmt_prepare](#) was called.

Parameters

`link`

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns an object.

See Also

[mysqli_stmt_prepare](#)

22.10.2.7.52. `mysqli::store_result`, `mysqli_store_result`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::store_result](#)

[mysqli_store_result](#)

Transfers a result set from the last query

Description

Object oriented style

```
mysqli_result mysqli::store_result();
```

Procedural style

```
mysqli_result mysqli_store_result(mysqli link);
```

Transfers the result set from the last query on the database connection represented by the `link` parameter to be used with the `mysqli_data_seek` function.

Parameters

<code>link</code>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
-------------------	--

Return Values

Returns a buffered result object or `FALSE` if an error occurred.

Note

`mysqli_store_result` returns `FALSE` in case the query didn't return a result set (if the query was, for example an INSERT statement). This function also returns `FALSE` if the reading of the result set failed. You can check if you have got an error by checking if `mysqli_error` doesn't return an empty string, if `mysqli_errno` returns a non zero value, or if `mysqli_field_count` returns a non zero value. Also possible reason for this function returning `FALSE` after successful call to `mysqli_query` can be too large result set (memory for it cannot be allocated). If `mysqli_field_count` returns a non-zero value, the statement should have produced a non-empty result set.

Notes

Note

Although it is always good practice to free the memory used by the result of a query using the `mysqli_free_result` function, when transferring large result sets using the `mysqli_store_result` this becomes particularly important.

Examples

See `mysqli_multi_query`.

`mysqli_real_query`
`mysqli_use_result`

22.10.2.7.53. `mysqli->thread_id`, `mysqli_thread_id`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli->thread_id`
`mysqli_thread_id`

Returns the thread ID for the current connection

Description

Object oriented style

```
mysqli {
    int thread_id ;
}
```

Procedural style

```
int mysqli_thread_id(mysqli link);
```

The `mysqli_thread_id` function returns the thread ID for the current connection which can then be killed using the `mysqli_kill` function. If the connection is lost and you reconnect with `mysqli_ping`, the thread ID will be other. Therefore you should get the thread ID only when you need it.

Note

The thread ID is assigned on a connection-by-connection basis. Hence, if the connection is broken and then re-established a new thread ID will be assigned.

To kill a running query you can use the SQL command `KILL QUERY processid`.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns the Thread ID for the current connection.

Examples**Example 22.109. `mysqli->thread_id` example**

Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error());
    exit();
}

/* determine our thread id */
$thread_id = $link->thread_id;

/* Kill connection */
$link->kill($thread_id);

/* This should produce an error */
if (!$link->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $link->error());
    exit();
}

/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit();
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Error: MySQL server has gone away
```

See Also

[mysqli_kill](#)

22.10.2.7.54. mysqli::thread_safe, mysqli_thread_safe

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::thread_safe](#)
- [mysqli_thread_safe](#)

Returns whether thread safety is given or not

Description

Procedural style

```
bool mysqli_thread_safe();
```

Tells whether the client library is compiled as thread-safe.

Return Values

[TRUE](#) if the client library is thread-safe, otherwise [FALSE](#).

22.10.2.7.55. mysqli::use_result, mysqli_use_result

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli::use_result](#)
 - [mysqli_use_result](#)
- Initiate a result set retrieval

Description

Object oriented style

```
mysqli_result mysqli::use_result();
```

Procedural style

```
mysqli_result mysqli_use_result(mysqli link);
```

Used to initiate the retrieval of a result set from the last query executed using the [mysqli_real_query](#) function on the database connection.

Either this or the [mysqli_store_result](#) function must be called before the results of a query can be retrieved, and one or the other must be called to prevent the next query on that database connection from failing.

Note

The [mysqli_use_result](#) function does not transfer the entire result set from the database and hence cannot be used functions such as [mysqli_data_seek](#) to move to a particular row within the set. To use this functionality, the result set must be stored using [mysqli_store_result](#). One should not use [mysqli_use_result](#) if a lot

of processing on the client side is performed, since this will tie up the server and prevent other threads from updating any tables from which the data is being fetched.

Return Values

Returns an unbuffered result object or `FALSE` if an error occurred.

Examples

Example 22.110. `mysqli::use_result` example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->use_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->close();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_use_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----\n");
        }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
my_user@localhost
-----
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer
```

22.10.2.7.56. mysqli->warning_count, mysqli_warning_count

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli->warning_count](#)
[mysqli_warning_count](#)

Returns the number of warnings from the last query for the given link

Description

Object oriented style

```
mysqli {
    int warning_count ;
}
```

Procedural style

```
int mysqli_warning_count(mysqli link);
```

Returns the number of warnings from the last query in the connection.

Note

For retrieving warning messages you can use the SQL command `SHOW WARNINGS [limit row_count]`.

Parameters

`link`

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Number of warnings or zero if there are no warnings.

Examples

Example 22.111. mysqli->warning_count example

Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* a remarkable city in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
    'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogoch')";

$mysqli->query($query);

if ($mysqli->warning_count) {
    if ($result = $mysqli->query("SHOW WARNINGS")) {
        $row = $result->fetch_row();
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        $result->close();
    }
}

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* a remarkable long city name in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
    'Llanfairpwllgwyngyllgogerychwyrndrobwllllantysiliogogoch')";

mysqli_query($link, $query);

if (mysqli_warning_count($link)) {
    if ($result = mysqli_query($link, "SHOW WARNINGS")) {
        $row = mysqli_fetch_row($result);
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        mysqli_free_result($result);
    }
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Warning (1264): Data truncated for column 'Name' at row 1
```

```

22.10.2.8.1. `mysqli_stmt->affected_rows`, `mysqli_stmt_affected_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt->affected_rows`
`mysqli_stmt_affected_rows`

Returns the total number of rows changed, deleted, or inserted by the last executed statement

Description

Object oriented style

```

mysqli_stmt {
    int affected_rows ;
}

```

Procedural style

```
int mysqli_stmt_affected_rows(mysqli_stmt stmt);
```

Returns the number of rows affected by `INSERT`, `UPDATE`, or `DELETE` query.

This function only works with queries which update a table. In order to get the number of rows from a `SELECT` query, use `mysqli_stmt_num_rows` instead.

Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE/DELETE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query has returned an error. `NULL` indicates an invalid argument was supplied to the function.

Note

If the number of affected rows is greater than maximal PHP int value, the number of affected rows will be returned as a string value.

Examples

Example 22.112. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
$mysqli->query("CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = $mysqli->prepare($query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    $stmt->bind_param("s", $code);

    /* execute statement */
    $stmt->execute();

    printf("rows inserted: %d\n", $stmt->affected_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 22.113. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
mysqli_query($link, "CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = mysqli_prepare($link, $query)) {

    /* Bind variable for placeholder */
    $code = 'A%';
    mysqli_stmt_bind_param($stmt, "s", $code);

    /* execute statement */
    mysqli_stmt_execute($stmt);

    printf("rows inserted: %d\n", mysqli_stmt_affected_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
rows inserted: 17
```

```
mysqli_stmt_num_rows  
mysqli_prepare
```

22.10.2.8.2. mysqli_stmt::attr_get, mysqli_stmt_attr_get

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::attr_get](#)
[mysqli_stmt_attr_get](#)

Used to get the current value of a statement attribute

Description

Object oriented style

```
int mysqli_stmt::attr_get(int attr);
```

Procedural style

```
int mysqli_stmt_attr_get(mysqli_stmt stmt,  
                           int attr);
```

Gets the current value of a statement attribute.

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

attr The attribute that you want to get.

Return Values

Returns [FALSE](#) if the attribute is not found, otherwise returns the value of the attribute.

22.10.2.8.3. mysqli_stmt::attr_set, mysqli_stmt_attr_set

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::attr_set](#)
[mysqli_stmt_attr_set](#)

Used to modify the behavior of a prepared statement

Description

Object oriented style

```
bool mysqli_stmt::attr_set(int attr,  
                           int mode);
```

Procedural style

```
bool mysqli_stmt_attr_set(mysqli_stmt stmt,  
                           int attr,  
                           int mode);
```

Used to modify the behavior of a prepared statement. This function may be called multiple times to set several attributes.

Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

`attr` The attribute that you want to set. It can have one of the following values:

Table 22.12. Attribute values

Character	Description
<code>MYSQLI_STMT_ATTR_UPDATE_MAX_LENGTH</code>	If set to 1, causes <code>mysqli_stmt_store_result</code> to update the metadata <code>MYSQL_FIELD->max_length</code> value.
<code>MYSQLI_STMT_ATTR_CURSOR_TYPE</code>	Type of cursor to open for statement when <code>mysqli_stmt_execute</code> is invoked. <code>mode</code> can be <code>MYSQLI_CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>MYSQLI_CURSOR_TYPE_READ_ONLY</code> .
<code>MYSQLI_STMT_ATTR_PREFETCH_ROWS</code>	Number of rows to fetch from server at a time when using a cursor. <code>mode</code> can be in the range from 1 to the maximum value of unsigned long. The default is 1.

If you use the `MYSQLI_STMT_ATTR_CURSOR_TYPE` option with `MYSQLI_CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysqli_stmt_execute`. If there is already an open cursor from a previous `mysqli_stmt_execute` call, it closes the cursor before opening a new one. `mysqli_stmt_reset` also closes any open cursor before preparing the statement for re-execution. `mysqli_stmt_free_result` closes any open cursor.

If you open a cursor for a prepared statement, `mysqli_stmt_store_result` is unnecessary.

`mode` The value to assign to the attribute.

22.10.2.8.4. `mysqli_stmt::bind_param`, `mysqli_stmt_bind_param`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::bind_param`
- `mysqli_stmt_bind_param`

Binds variables to a prepared statement as parameters

Description

Object oriented style

```
bool mysqli_stmt::bind_param(string types,
                             mixed var1,
                             mixed ...);
```

Procedural style

```
bool mysqli_stmt_bind_param(mysqli_stmt stmt,
                           string types,
                           mixed var1,
                           mixed ...);
```

Bind variables for the parameter markers in the SQL statement that was passed to `mysqli_prepare`.

Note

If data size of a variable exceeds max. allowed packet size (`max_allowed_packet`), you have to specify `b` in `types` and use `mysqli_stmt_send_long_data` to send the data in packets.

Note

Care must be taken when using `mysqli_stmt_bind_param` in conjunction with `call_user_func_array`. Note that `mysqli_stmt_bind_param` requires parameters to be passed by reference, whereas

■ `call_user_func_array` can accept as a parameter a list of variables that can represent references or values.

Parameters

`stmt`

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

`types`

A string that contains one or more characters which specify the types for the corresponding bind variables:

Table 22.13. Type specification chars

Character	Description
i	corresponding variable has type integer
d	corresponding variable has type double
s	corresponding variable has type string
b	corresponding variable is a blob and will be sent in packets

`var1`

The number of variables and length of string `types` must match the parameters in the statement.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.114. Object oriented style

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$stmt = $mysqli->prepare("INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
$stmt->bind_param('sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
$stmt->execute();

printf("%d Row inserted.\n", $stmt->affected_rows);

/* close statement and connection */
$stmt->close();

/* Clean up table CountryLanguage */
$mysqli->query("DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", $mysqli->affected_rows);

/* close connection */
$mysqli->close();
?>
```

Example 22.115. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (!$link) {
```

```

    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = mysqli_prepare($link, "INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
mysqli_stmt_bind_param($stmt, 'sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
mysqli_stmt_execute($stmt);

printf("%d Row inserted.\n", mysqli_stmt_affected_rows($stmt));

/* close statement and connection */
mysqli_stmt_close($stmt);

/* Clean up table CountryLanguage */
mysqli_query($link, "DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", mysqli_affected_rows($link));

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

1 Row inserted.
1 Row deleted.

```

- [mysqli_stmt::bind_result](#)
mysqli_stmt_bind_result
 Binds variables to a prepared statement for result storage

Description

Object oriented style

```

bool mysqli_stmt::bind_result(mixed var1,
                               mixed ...);

```

Procedural style

```

bool mysqli_stmt_bind_result(mysqli_stmt stmt,
                             mixed var1,
                             mixed ...);

```

Binds columns in the result set to variables.

When `mysqli_stmt_fetch` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified variables `var1`,

Note

Note that all columns must be bound after `mysqli_stmt_execute` and prior to calling `mysqli_stmt_fetch`. Depending on column types bound variables can silently change to the corresponding PHP type.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysqli_stmt_fetch` is called.

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>var1</code>	The variable to be bound.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.116. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = $mysqli->prepare("SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    $stmt->execute();

    /* bind variables to prepared statement */
    $stmt->bind_result($col1, $col2);

    /* fetch values */
    while ($stmt->fetch()) {
        printf("%s %s\n", $col1, $col2);
    }

    /* close statement */
    $stmt->close();
}
/* close connection */
$mysqli->close();

?>
```

Example 22.117. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = mysqli_prepare($link, "SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    mysqli_stmt_execute($stmt);

    /* bind variables to prepared statement */
    mysqli_stmt_bind_result($stmt, $col1, $col2);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
```

```

    printf("%s %s\n", $col1, $col2);
}

/* close statement */
mysqli_stmt_close($stmt);

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

AFG Afghanistan
ALB Albania
DZA Algeria
ASM American Samoa
AND Andorra

```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::close](#)
[mysqli_stmt_close](#)
Closes a prepared statement

Description

Object oriented style

```
bool mysqli_stmt::close();
```

Procedural style

```
bool mysqli_stmt_close(mysqli_stmt stmt);
```

Closes a prepared statement. [mysqli_stmt_close](#) also deallocates the statement handle. If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Parameters

stmt

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

See Also

[mysqli_prepare](#)

22.10.2.8.7. `mysqli_stmt::data_seek`, `mysqli_stmt_data_seek`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::data_seek](#)

[mysqli_stmt_data_seek](#)

Seeks to an arbitrary row in statement result set

Description

Object oriented style

```
void mysqli_stmt::data_seek(int offset);
```

Procedural style

```
void mysqli_stmt_data_seek(mysqli_stmt stmt,
                           int offset);
```

Seeks to an arbitrary result pointer in the statement result set.

[mysqli_stmt_store_result](#) must be called prior to [mysqli_stmt_data_seek](#).

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

offset Must be between zero and the total number of rows minus one (0..
[mysqli_stmt_num_rows](#) - 1).

Return Values

No value is returned.

Examples

Example 22.118. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error);
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* store result */
    $stmt->store_result();

    /* seek to row no. 400 */
    $stmt->data_seek(399);

    /* fetch values */
}
```

```

$stmt->fetch();

printf ("City: %s Countrycode: %s\n", $name, $code);

/* close statement */
$stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 22.119. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* store result */
    mysqli_stmt_store_result($stmt);

    /* seek to row no. 400 */
    mysqli_stmt_data_seek($stmt, 399);

    /* fetch values */
    mysqli_stmt_fetch($stmt);

    printf ("City: %s Countrycode: %s\n", $name, $code);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
City: Benin City Countrycode: NGA
```

[Copyright 1997-2010 the PHP Documentation Group.](#)

- [mysqli_stmt->errno](#)
- [mysqli_stmt_errno](#)

Returns the error code for the most recent statement call

Description

Object oriented style

```
mysqli_stmt {
    int errno ;
}
```

Procedural style

```
int mysqli_stmt_errno(mysqli_stmt stmt);
```

Returns the error code for the most recently invoked statement function that can succeed or fail.

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by mysqli_stmt_init .
-------------------	--

Return Values

An error code value. Zero means no error occurred.

Examples

Example 22.120. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "CREATE TABLE myCountry LIKE Country";
$mysqli->query($query);

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %d.\n", $stmt->errno);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 22.121. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %d.\n", mysqli_stmt_errno($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Error: 1146.
```

- [mysqli_stmt->error](#)
- [mysqli_stmt_error](#)

Returns a string description for last statement error

Description

Object oriented style

```

mysqli_stmt {
    string error ;
}

```

Procedural style

```
string mysqli_stmt_error(mysqli_stmt stmt);
```

Returns a containing the error message for the most recently invoked statement function that can succeed or fail.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 22.122. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->error);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 22.123. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_error($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
```

```
?>
```

The above examples will output:

```
Error: Table 'world.myCountry' doesn't exist.
```

- [mysqli_stmt::execute](#)

[mysqli_stmt_execute](#)

Executes a prepared Query

Description

Object oriented style

```
bool mysqli_stmt::execute();
```

Procedural style

```
bool mysqli_stmt_execute(mysqli_stmt stmt);
```

Executes a query that has been previously prepared using the [mysqli_prepare](#) function. When executed any parameter markers which exist will automatically be replaced with the appropriate data.

If the statement is [UPDATE](#), [DELETE](#), or [INSERT](#), the total number of affected rows can be determined by using the [mysqli_stmt_affected_rows](#) function. Likewise, if the query yields a result set the [mysqli_stmt_fetch](#) function is used.

Note

When using [mysqli_stmt_execute](#), the [mysqli_stmt_fetch](#) function must be used to fetch the data prior to performing any additional queries.

Parameters

`stmt`

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 22.124. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = $mysqli->prepare($query);

$stmt->bind_param("sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
$stmt->execute();

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
$stmt->execute();

/* close statement */
$stmt->close();

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = $mysqli->query($query)) {
    while ($row = $result->fetch_row()) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    $result->close();
}

/* remove table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>

```

Example 22.125. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = mysqli_prepare($link, $query);

mysqli_stmt_bind_param($stmt, "sss", $val1, $val2, $val3);

$val1 = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
mysqli_stmt_execute($stmt);

$val1 = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
mysqli_stmt_execute($stmt);

/* close statement */
mysqli_stmt_close($stmt);

/* retrieve all rows from myCity */

```

```
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = mysqli_query($link, $query)) {
    while ($row = mysqli_fetch_row($result)) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    mysqli_free_result($result);
}

/* remove table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Stuttgart (DEU,Baden-Wuerttemberg)
Bordeaux (FRA,Aquitaine)
```

- [mysqli_stmt_fetch](#)

Fetch results from a prepared statement into the bound variables

Description

Object oriented style

```
bool mysqli_stmt::fetch();
```

Procedural style

```
bool mysqli_stmt_fetch(mysqli_stmt $stmt);
```

Fetch the result from a prepared statement into the variables bound by [mysqli_stmt_bind_result](#).

Note

Note that all columns must be bound by the application before calling [mysqli_stmt_fetch](#).

Note

Data are transferred unbuffered without calling [mysqli_stmt_store_result](#) which can decrease performance (but reduces memory cost).

Parameters

`stmt`

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Table 22.14. Return Values

Value	Description
TRUE	Success. Data has been fetched
FALSE	Error occurred
NULL	No more rows/data exists or data truncation occurred

Examples

Example 22.126. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = $mysqli->prepare($query)) {
    /* execute statement */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* fetch values */
    while ($stmt->fetch()) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 22.127. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = mysqli_prepare($link, $query)) {
    /* execute statement */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
```

```
?>
```

The above examples will output:

```
Rockford (USA)
Tallahassee (USA)
Salinas (USA)
Santa Clarita (USA)
Springfield (USA)
```

22.10.2.8.16. `mysqli_stmt::num_rows`, `mysqli_stmt_num_rows`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_stmt::num_rows`

`mysqli_stmt_num_rows`

Return the number of rows in statements result set

Description

Object oriented style

```
mysqli_stmt {
    int num_rows ;
}
```

Procedural style

```
int mysqli_stmt_num_rows(mysqli_stmt $stmt);
```

Returns the number of rows in the result set. The use of `mysqli_stmt_num_rows` depends on whether or not you used `mysqli_stmt_store_result` to buffer the entire result set in the statement handle.

If you use `mysqli_stmt_store_result`, `mysqli_stmt_num_rows` may be called immediately.

Parameters

`stmt`

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

An integer representing the number of rows in result set.

Examples

Example 22.128. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno()) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* close statement */
    $stmt->close();
}
```

```
}
/* close connection */
$mysqli->close();
?>
```

Example 22.129. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Number of rows: 20.
```

22.10.2.8.17. [mysqli_stmt->param_count](#), [mysqli_stmt_param_count](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt->param_count](#)
[mysqli_stmt_param_count](#)

Returns the number of parameter for the given statement

Description

Object oriented style

```
mysqli_stmt {
    int param_count ;
```

```
}
```

Procedural style

```
int mysqli_stmt_param_count(mysqli_stmt stmt);
```

Returns the number of parameter markers present in the prepared statement.

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
-------------------	---

Return Values

Returns an integer representing the number of parameters.

Examples

Example 22.130. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

if ($stmt = $mysqli->prepare("SELECT Name FROM Country WHERE Name=? OR Code=?")) {
    $marker = $stmt->param_count;
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 22.131. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error());
    exit();
}

if ($stmt = mysqli_prepare($link, "SELECT Name FROM Country WHERE Name=? OR Code=?")) {
    $marker = mysqli_stmt_param_count($stmt);
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Statement has 2 markers.
```

See Also

[mysqli_prepare](#)

22.10.2.8.18. mysqli_stmt::prepare, mysqli_stmt_prepare

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::prepare](#)

[mysqli_stmt_prepare](#)

Prepare an SQL statement for execution

Description

Object oriented style

```
mixed mysqli_stmt::prepare(string query);
```

Procedural style

```
bool mysqli_stmt_prepare(mysqli_stmt stmt,
                         string query);
```

Prepares the SQL query pointed to by the null-terminated string *query*.

The parameter markers must be bound to application variables using [mysqli_stmt_bind_param](#) and/or [mysqli_stmt_bind_result](#) before executing the statement or fetching rows.

Note

In the case where you pass a statement to [mysqli_stmt_prepare](#) that is longer than [max_allowed_packet](#) of the server, the returned error codes are different depending on whether you are using MySQL Native Driver ([mysqlnd](#)) or MySQL Client Library ([libmysql](#)). The behavior is as follows:

- [mysqlnd](#) on Linux returns an error code of 1153. The error message means “got a packet bigger than [max_allowed_packet](#) bytes”.
- [mysqlnd](#) on Windows returns an error code 2006. This error message means “server has gone away”.
- [libmysql](#) on all platforms returns an error code 2006. This error message means “server has gone away”.

Parameters

stmt

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

query

The query, as a string. It must consist of a single SQL statement.

You can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

Note

You should not add a terminating semicolon or \g to the statement.

Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a SELECT statement), or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

Returns TRUE on success or FALSE on failure.

Examples

Example 22.132. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = $mysqli->stmt_init();
if ($stmt->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);
}

/* close statement */
$stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 22.133. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = mysqli_stmt_init($link);
if ($stmt->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);
```

```

/* bind result variables */
mysqli_stmt_bind_result($stmt, $district);

/* fetch value */
mysqli_stmt_fetch($stmt);

printf("%s is in district %s\n", $city, $district);

/* close statement */
mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Amersfoort is in district Utrecht
```

[mysqli_stmt_bind_result](#), [mysqli_stmt_close](#).

22.10.2.8.19. `mysqli_stmt::reset`, `mysqli_stmt_reset`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::reset](#)

[mysqli_stmt_reset](#)

Resets a prepared statement

Description

Object oriented style

```
bool mysqli_stmt::reset();
```

Procedural style

```
bool mysqli_stmt_reset(mysqli_stmt stmt);
```

Resets a prepared statement on client and server to state after prepare.

It resets the statement on the server, data sent using [mysqli_stmt_send_long_data](#), unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To prepare a statement with another query use function [mysqli_stmt_prepare](#).

Parameters

stmt

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

See Also

[mysqli_prepare](#)

22.10.2.8.20. `mysqli_stmt::result_metadata`, `mysqli_stmt_result_metadata`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::result_metadata](#)

[mysqli_stmt_result_metadata](#)

Returns result set metadata from a prepared statement

Description

Object oriented style

```
mysqli_result mysqli_stmt::result_metadata();
```

Procedural style

```
mysqli_result mysqli_stmt_result_metadata(mysqli_stmt stmt);
```

If a statement passed to [mysqli_prepare](#) is one that produces a result set, [mysqli_stmt_result_metadata](#) returns the result object that can be used to process the meta information such as total number of fields and individual field information.

Note

This result set pointer can be passed as an argument to any of the field-based functions that process result set metadata, such as:

- [mysqli_num_fields](#)
- [mysqli_fetch_field](#)
- [mysqli_fetch_field_direct](#)
- [mysqli_fetch_fields](#)
- [mysqli_field_count](#)
- [mysqli_field_seek](#)
- [mysqli_field_tell](#)
- [mysqli_free_result](#)

The result set structure should be freed when you are done with it, which you can do by passing it to [mysqli_free_result](#)

Note

The result set returned by [mysqli_stmt_result_metadata](#) contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with [mysqli_stmt_fetch](#).

Parameters

stmt

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Returns a result object or [FALSE](#) if an error occurred.

Examples

Example 22.134. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query("DROP TABLE IF EXISTS friends");
$mysqli->query("CREATE TABLE friends (id int, name varchar(20))");

$mysqli->query("INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = $mysqli->prepare("SELECT id, name FROM friends");
$stmt->execute();

/* get resultset for metadata */
$result = $stmt->result_metadata();

/* retrieve field information from metadata result set */
$field = $result->fetch_field();

printf("Fieldname: %s\n", $field->name);

/* close resultset */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Example 22.135. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");

mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = mysqli_prepare($link, "SELECT id, name FROM friends");
mysqli_stmt_execute($stmt);

/* get resultset for metadata */
$result = mysqli_stmt_result_metadata($stmt);

/* retrieve field information from metadata result set */
$field = mysqli_fetch_field($result);

printf("Fieldname: %s\n", $field->name);

/* close resultset */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

[mysqli_free_result](#)

22.10.2.8.21. [mysqli_stmt::send_long_data](#), [mysqli_stmt_send_long_data](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::send_long_data](#)

[mysqli_stmt_send_long_data](#)

Send data in blocks

Description

Object oriented style

```
bool mysqli_stmt::send_long_data(int param_nr,
                                  string data);
```

Procedural style

```
bool mysqli_stmt_send_long_data(mysqli_stmt stmt,
                                  int param_nr,
                                  string data);
```

Allows to send parameter data to the server in pieces (or chunks), e.g. if the size of a blob exceeds the size of [max_allowed_packet](#). This function can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB datatypes.

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

param_nr Indicates which parameter to associate the data with. Parameters are numbered beginning with 0.

data A string containing data to be sent.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples**Example 22.136. Object oriented style**

```
<?php
$stmt = $mysqli->prepare("INSERT INTO messages (message) VALUES (?)");
$stmt->bind_param("b", $null);
$fp = fopen("messages.txt", "r");
while (!feof($fp)) {
    $stmt->send_long_data(0, fread($fp, 8192));
}
fclose($fp);
$stmt->execute();
?>
```

22.10.2.8.22. mysqli_stmt::sqlstate, mysqli_stmt_sqlstate

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::sqlstate](#)
[mysqli_stmt_sqlstate](#)

Returns SQLSTATE error from previous statement operation

Description

Object oriented style

```
mysqli_stmt {
    string sqlstate ;
}
```

Procedural style

```
string mysqli_stmt_sqlstate(mysqli_stmt stmt);
```

Returns a string containing the SQLSTATE error code for the most recently invoked prepared statement function that can succeed or fail. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

Notes

Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value HY000 (general error) is used for unmapped errors.

Examples

Example 22.137. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->sqlstate);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
```

```

/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_sqlstate($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Error: 42S02.
```

22.10.2.8.23. `mysqli_stmt::store_result`, `mysqli_stmt_store_result`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_stmt::store_result](#)

[mysqli_stmt_store_result](#)

Transfers a result set from a prepared statement

Description

Object oriented style

```
bool mysqli_stmt::store_result();
```

Procedural style

```
bool mysqli_stmt_store_result(mysqli_stmt stmt);
```

You must call [mysqli_stmt_store_result](#) for every query that successfully produces a result set ([SELECT](#), [SHOW](#), [DESCRIBE](#), [EXPLAIN](#)), and only if you want to buffer the complete result set by the client, so that the subsequent [mysqli_stmt_fetch](#) call returns buffered data.

 **Note**

It is unnecessary to call `mysqli_stmt_store_result` for other queries, but if you do, it will not harm or cause any notable performance in all cases. You can detect whether the query produced a result set by checking if `mysqli_stmt_result_metadata` returns NULL.

Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 22.138. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* free result */
    $stmt->free_result();

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* free result */
    mysqli_stmt_free_result($stmt);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
```

```
?>
```

The above examples will output:

```
Number of rows: 20.
```

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->current_field`
`mysqli_field_tell`
Get current field offset of a result pointer

Description

Object oriented style

```

mysqli_result {
    int current_field ;
}

```

Procedural style

```
int mysqli_field_tell(mysqli_result result);
```

Returns the position of the field cursor used for the last `mysqli_fetch_field` call. This value can be used as an argument to `mysqli_field_seek`.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns current offset of field cursor.

Examples

Example 22.139. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {
    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        /* get fieldpointer offset */
        $currentfield = $result->current_field;

        printf("Column %d:\n", $currentfield);
        printf("Name:      %s\n", $finfo->name);
    }
}

```

```

        printf("Table:      %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:     %d\n", $finfo->flags);
        printf("Type:      %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        /* get fieldpointer offset */
        $currentfield = mysqli_field_tell($result);

        printf("Column %d:\n", $currentfield);
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:     %d\n", $finfo->flags);
        printf("Type:      %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Column 1:
Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:     254

Column 2:
Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:     4

```

See Also

[mysqli_fetch_field](#)
[mysqli_field_seek](#)

22.10.2.9.2. `mysqli_result::data_seek`, `mysqli_data_seek`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::data_seek`

`mysqli_data_seek`

Adjusts the result pointer to an arbitrary row in the result

Description

Object oriented style

```
bool mysqli_result::data_seek(int offset);
```

Procedural style

```
bool mysqli_data_seek(mysqli_result result,
                      int offset);
```

The `mysqli_data_seek` function seeks to an arbitrary result pointer specified by the `offset` in the result set.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`offset`

The field offset. Must be between zero and the total number of rows minus one (0..`mysqli_num_rows` - 1).

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

Note

This function can only be used with buffered results attained from the use of the `mysqli_store_result` or `mysqli_query` functions.

Examples

Example 22.140. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = $mysqli->query($query)) {

    /* seek to row no. 400 */
    $result->data_seek(399);

    /* fetch row */
    $row = $result->fetch_row();

    printf ("City: %s  Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";

if ($result = mysqli_query($link, $query)) {

    /* seek to row no. 400 */
    mysqli_data_seek($result, 399);

    /* fetch row */
    $row = mysqli_fetch_row($result);

    printf ("City: %s  Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
City: Benin City  Countrycode: NGA
```

- [mysqli_result::fetch_all](#)
[mysqli_fetch_all](#)

Fetches all result rows as an associative array, a numeric array, or both

Description

Object oriented style

```
mixed mysqli_result::fetch_all(int resulttype= MYSQLI_NUM);
```

Procedural style

```
mixed mysqli_fetch_all(mysqli_result result,
                      int resulttype= MYSQLI_NUM);
```

`mysqli_fetch_all` fetches all result rows and returns the result set as an associative array, a numeric array, or both.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`resulttype`

This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants `MYSQLI_ASSOC`, `MYSQLI_NUM`, or `MYSQLI_BOTH`.

Return Values

Returns an array of associative or numeric arrays holding result rows.

MySQL Native Driver Only

Available only with `mysqlnd`.

As `mysqli_fetch_all` returns all the rows as an array in a single step, it may consume more memory than some similar functions such as `mysqli_fetch_array`, which only returns one row at a time from the result set. Further, if you need to iterate over the result set, you will need a looping construct that will further impact performance. For these reasons `mysqli_fetch_all` should only be used in those situations where the fetched result set will be sent to another layer for processing.

See Also

`mysqli_fetch_array`
`mysqli_query`

22.10.2.9.4. `mysqli_result::fetch_array`, `mysqli_fetch_array`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_array`
`mysqli_fetch_array`

Fetch a result row as an associative, a numeric array, or both

Description

Object oriented style

```
mixed mysqli_result::fetch_array(int resulttype= =MYSQLI_BOTH);
```

Procedural style

```
mixed mysqli_fetch_array(mysqli_result $result,
                           int resulttype= =MYSQLI_BOTH);
```

Returns an array that corresponds to the fetched row or `NULL` if there are no more rows for the resultset represented by the `result` parameter.

`mysqli_fetch_array` is an extended version of the `mysqli_fetch_row` function. In addition to storing the data in the numeric indices of the result array, the `mysqli_fetch_array` function can also store the data in associative indices, using the field names of the result set as keys.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

If two or more columns of the result have the same field names, the last column will take precedence and overwrite the earlier data. In order to access multiple columns with the same name, the numerically indexed version of the row must be used.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`resulttype`

This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants `MYSQLI_ASSOC`, `MYSQLI_NUM`, or `MYSQLI_BOTH`.

By using the `MYSQLI_ASSOC` constant this function will behave identically to the `mysqli_fetch_assoc`, while `MYSQLI_NUM` will behave identically to the `mysqli_fetch_row` function. The final option `MYSQLI_BOTH` will create a single array with the attributes of both.

Return Values

Returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

Examples

Example 22.141. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno()) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = $mysqli->query($query);

/* numeric array */
$row = $result->fetch_array(MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = $result->fetch_array(MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = $result->fetch_array(MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno()) {
    printf("Connect failed: %s\n", $link->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = mysqli_query($link, $query);

/* numeric array */
$row = mysqli_fetch_array($result, MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = mysqli_fetch_array($result, MYSQLI_ASSOC);
```

```

printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
/* associative and numeric array */
$row = mysqli_fetch_array($result, MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);
/* free result set */
mysqli_free_result($result);
/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Kabul (AFG)
Qandahar (AFG)
Herat (AFG)

```

- [mysqli_result::fetch_assoc](#)
[mysqli_fetch_assoc](#)

Fetch a result row as an associative array

Description

Object oriented style

```
array mysqli_result::fetch_assoc();
```

Procedural style

```
array mysqli_fetch_assoc(mysqli_result $result);
```

Returns an associative array that corresponds to the fetched row or [NULL](#) if there are no more rows.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP [NULL](#) value.

Parameters

result

Procedural style only: A result set identifier returned by [mysqli_query](#), [mysqli_store_result](#) or [mysqli_use_result](#).

Return Values

Returns an associative array of strings representing the fetched row in the result set, where each key in the array represents the name of one of the result set's columns or `NULL` if there are no more rows in resultset.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysqli_fetch_row` or add alias names.

Examples

Example 22.142. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch associative array */
    while ($row = $result->fetch_assoc()) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    $result->free();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_assoc($result)) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

22.10.2.9.6. `mysqli_result::fetch_field_direct`, `mysqli_fetch_field_direct`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_result::fetch_field_direct](#)
[mysqli_fetch_field_direct](#)
Fetch meta-data for a single field

Description

Object oriented style

```
object mysqli_result::fetch_field_direct(int fieldnr);
```

Procedural style

```
object mysqli_fetch_field_direct(mysqli_result result,
int fieldnr);
```

Returns an object which contains field definition information from the specified result set.

Parameters

result Procedural style only: A result set identifier returned by [mysqli_query](#), [mysqli_store_result](#) or [mysqli_use_result](#).

fieldnr The field number. This value must be in the range from 0 to [number of fields - 1](#).

Return Values

Returns an object which contains field definition information or [FALSE](#) if no field information for specified **fieldnr** is available.

Table 22.15. Object attributes

Attribute	Description
<code>name</code>	The name of the column
<code>orgname</code>	Original column name if an alias was specified
<code>table</code>	The name of the table this field belongs to (if not calculated)
<code>orgtable</code>	Original table name if an alias was specified
<code>def</code>	The default value for this field, represented as a string
<code>max_length</code>	The maximum width of the field for the result set.
<code>length</code>	The width of the field, as specified in the table definition.
<code>charsetnr</code>	The character set number for the field.
<code>flags</code>	An integer representing the bit-flags for the field.
<code>type</code>	The data type used for this field
<code>decimals</code>	The number of decimals used (for integer fields)

Examples

Example 22.143. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = $result->fetch_field_direct(1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n", $finfo->type);

    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = mysqli_fetch_field_direct($result, 1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4
```

- [mysqli_result::fetch_field](#)

[mysqli_fetch_field](#)

Returns the next field in the result set

Description

Object oriented style

```
object mysqli_result::fetch_field();
```

Procedural style

```
object mysqli_fetch_field(mysqli_result $result);
```

Returns the definition of one column of a result set as an object. Call this function repeatedly to retrieve information about all columns in the result set.

Parameters

result

Procedural style only: A result set identifier returned by [mysqli_query](#), [mysqli_store_result](#) or [mysqli_use_result](#).

Return Values

Returns an object which contains field definition information or [FALSE](#) if no field information is available.

Table 22.16. Object properties

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 22.144. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:     %d\n", $finfo->flags);
        printf("Type:      %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:     %d\n", $finfo->flags);
        printf("Type:      %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:      254

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

22.10.2.9.8. mysqli_result::fetch_fields, mysqli_fetch_fields

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_fields`
- `mysqli_fetch_fields`

Returns an array of objects representing the fields in a result set

Description

Object oriented style

```
array mysqli_result::fetch_fields();
```

Procedural style

```
array mysqli_fetch_fields(mysqli_result result);
```

This function serves an identical purpose to the `mysqli_fetch_field` function with the single difference that, instead of returning one object at a time for each field, the columns are returned as an array of objects.

Parameters

<code>result</code>	Procedural style only: A result set identifier returned by <code>mysqli_query</code> , <code>mysqli_store_result</code> or <code>mysqli_use_result</code> .
---------------------	---

Return Values

Returns an array of objects which contains field definition information or `FALSE` if no field information is available.

Table 22.17. Object properties

Property	Description
<code>name</code>	The name of the column
<code>orgname</code>	Original column name if an alias was specified
<code>table</code>	The name of the table this field belongs to (if not calculated)
<code>orgtable</code>	Original table name if an alias was specified
<code>max_length</code>	The maximum width of the field for the result set.
<code>length</code>	The width of the field, as specified in the table definition.
<code>charsetnr</code>	The character set number for the field.
<code>flags</code>	An integer representing the bit-flags for the field.
<code>type</code>	The data type used for this field
<code>decimals</code>	The number of decimals used (for integer fields)

Examples

Example 22.145. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
```

```

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    $finfo = $result->fetch_fields();

    foreach ($finfo as $val) {
        printf("Name:      %s\n", $val->name);
        printf("Table:     %s\n", $val->table);
        printf("max. Len:  %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all columns */
    $finfo = mysqli_fetch_fields($result);

    foreach ($finfo as $val) {
        printf("Name:      %s\n", $val->name);
        printf("Table:     %s\n", $val->table);
        printf("max. Len:  %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Name:      Name
Table:     Country
max. Len:  11
Flags:    1
Type:     254

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:    32769
Type:     4

```

mysqli_fetch_field_direct
mysqli_fetch_field
```

22.10.2.9.9. mysqli_result::fetch_object, mysqli_fetch_object

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result::fetch_object`

```
mysqli_fetch_object
```

Returns the current row of a result set as an object

Description

Object oriented style

```
object mysqli_result::fetch_object(string class_name,
array params);
```

Procedural style

```
object mysqli_fetch_object(mysqli_result result,
string class_name,
array params);
```

The `mysqli_fetch_object` will return the current row result set as an object where the attributes of the object represent the names of the fields found within the result set.

Note that `mysqli_fetch_object` sets the properties of the object before calling the object constructor.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`class_name`

The name of the class to instantiate, set the properties of and return. If not specified, a `stdClass` object is returned.

`params`

An optional array of parameters to pass to the constructor for `class_name` objects.

Return Values

Returns an object with string properties that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

Changelog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 22.146. Object oriented style

```
<?php
```

```
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
if ($mysqli->connect_errno()) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
    /* fetch object array */
    while ($obj = $result->fetch_object()) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }
    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = mysqli_query($link, $query)) {
    /* fetch associative array */
    while ($obj = mysqli_fetch_object($result)) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }
    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)
```

- `mysqli_result::fetch_row`

`mysqli_fetch_row`

Get a result row as an enumerated array

Description

Object oriented style

```
mixed mysqli_result::fetch_row();
```

Procedural style

```
mixed mysqli_fetch_row(mysqli_result $result);
```

Fetches one row of data from the result set and returns it as an enumerated array, where each column is stored in an array offset starting from 0 (zero). Each subsequent call to this function will return the next row within the result set, or `NULL` if there are no more rows.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

`mysqli_fetch_row` returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in result set.

Note

This function sets NULL fields to the PHP `NULL` value.

Examples

Example 22.147. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = $mysqli->query($query)) {

    /* fetch object array */
    while ($row = $result->fetch_row()) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";

if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_row($result)) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

22.10.2.9.11. `mysqli_result->field_count`, `mysqli_num_fields`

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_result->field_count](#)
[mysqli_num_fields](#)

Get the number of fields in a result

Description

Object oriented style

```

mysqli_result {
    int field_count ;
}

```

Procedural style

```
int mysqli_num_fields(mysqli_result result);
```

Returns the number of fields from specified result set.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

The number of fields from a result set.

Examples

Example 22.148. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = $result->field_count;

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($link->connect_errno) {
    printf("Connect failed: %s\n", $link->connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = mysqli_num_fields($result);

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Result set has 5 fields.
```

See Also

```
mysqli_fetch_field
```

22.10.2.9.12. mysqli_result::field_seek, mysqli_field_seek

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_result::field_seek](#)

```
mysqli_field_seek
```

Set result pointer to a specified field offset

Description

Object oriented style

```
bool mysqli_result::field_seek(int fieldnr);
```

Procedural style

```
bool mysqli_field_seek(mysqli_result result,
                        int fieldnr);
```

Sets the field cursor to the given offset. The next call to [mysqli_fetch_field](#) will retrieve the field definition of the column associated with that offset.

Note

To seek to the beginning of a row, pass an offset value of zero.

Parameters

<i>result</i>	Procedural style only: A result set identifier returned by mysqli_query , mysqli_store_result or mysqli_use_result .
---------------	--

<i>fieldnr</i>	The field number. This value must be in the range from 0 to number of fields - 1 .
----------------	--

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 22.149. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for 2nd column */
    $result->field_seek(1);
    $finfo = $result->fetch_field();

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n", $finfo->type);

    $result->close();
}
```

```
/* close connection */
$link->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for 2nd column */
    mysqli_field_seek($result, 1);
    $finfo = mysqli_fetch_field($result);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4
```

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_result::free](#)
- [mysqli_free_result](#)

Frees the memory associated with a result

Description

Object oriented style

```
void mysqli_result::free();

void mysqli_result::close();
```

```
void mysqli_result::free_result();
```

Procedural style

```
void mysqli_free_result(mysqli_result result);
```

Frees the memory associated with the result.

Note

You should always free your result with `mysqli_free_result`, when your result object is not needed anymore.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

No value is returned.

See Also

`mysqli_query`
`mysqli_stmt_store_result`

22.10.2.9.14. `mysqli_result->lengths`, `mysqli_fetch_lengths`

Copyright 1997-2010 the PHP Documentation Group.

- `mysqli_result->lengths`
- `mysqli_fetch_lengths`

Returns the lengths of the columns of the current row in the result set

Description

Object oriented style

```
mysqli_result {
    array lengths ;
}
```

Procedural style

```
array mysqli_fetch_lengths(mysqli_result result);
```

The `mysqli_fetch_lengths` function returns an array containing the lengths of every column of the current row within the result set.

Parameters

`result`

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

An array of integers representing the size of each column (not including any terminating null characters). **FALSE** if an error occurred.

`mysqli_fetch_lengths` is valid only for the current row of the result set. It returns **FALSE** if you call it before calling `mysqli_fetch_row/array/object` or after retrieving all rows in the result.

Examples

Example 22.150. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = $mysqli->query($query)) {
    $row = $result->fetch_row();

    /* display column lengths */
    foreach ($result->lengths as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = mysqli_query($link, $query)) {
    $row = mysqli_fetch_row($result);

    /* display column lengths */
    foreach (mysqli_fetch_lengths($result) as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above examples will output:

```
Field 1 has Length 3
Field 2 has Length 5
Field 3 has Length 13
Field 4 has Length 9
Field 5 has Length 6
Field 6 has Length 1
Field 7 has Length 6
Field 8 has Length 4
Field 9 has Length 6
Field 10 has Length 6
Field 11 has Length 5
Field 12 has Length 44
```

```
Field 13 has Length 7
Field 14 has Length 3
Field 15 has Length 2
```

22.10.2.9.15. mysqli_result->num_rows, mysqli_num_rows

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_result->num_rows](#)
- [mysqli_num_rows](#)

Gets the number of rows in a result

Description

Object oriented style

```
mysqli_result {
    int num_rows ;
}
```

Procedural style

```
int mysqli_num_rows(mysqli_result result);
```

Returns the number of rows in the result set.

The use of [mysqli_num_rows](#) depends on whether you use buffered or unbuffered result sets. In case you use unbuffered result sets [mysqli_num_rows](#) will not return the correct number of rows until all the rows in the result have been retrieved.

Parameters

result	Procedural style only: A result set identifier returned by mysqli_query , mysqli_store_result or mysqli_use_result .
------------------------	--

Return Values

Returns number of rows in the result set.

Note

If the number of rows is greater than maximal int value, the number will be returned as a string.

Examples

Example 22.151. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
/* check connection */
if ($mysqli->connect_errno) {
    printf("Connect failed: %s\n", $mysqli->connect_error());
    exit();
}
if ($result = $mysqli->query("SELECT Code, Name FROM Country ORDER BY Name")) {
    /* determine number of rows result set */
    $row_cnt = $result->num_rows;
    printf("Result set has %d rows.\n", $row_cnt);
```

```

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT Code, Name FROM Country ORDER BY Name")) {

    /* determine number of rows result set */
    $row_cnt = mysqli_num_rows($result);

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above examples will output:

```
Result set has 239 rows.
```

22.10.2.12.16. [mysqli_report](#)

Copyright 1997-2010 the PHP Documentation Group.

- [mysqli_report](#)

Enables or disables internal report functions

Description

```
bool mysqli_report(int flags);
```

`mysqli_report` is a powerful function to improve your queries and code during development and testing phase. Depending on the flags it reports errors from mysqli function calls or queries which don't use an index (or use a bad index).

Parameters

flags

Table 22.18. Supported flags

Name	Description
<code>MYSQLI_REPORT_OFF</code>	Turns reporting off
<code>MYSQLI_REPORT_ERROR</code>	Report errors from mysqli function calls
<code>MYSQLI_REPORT_STRICT</code>	Throw <code>mysqli_sql_exception</code> for errors instead of warnings
<code>MYSQLI_REPORT_INDEX</code>	Report if no index or bad index was used in a query
<code>MYSQLI_REPORT_ALL</code>	Set all options (report all)

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Changelog

Version	Description
5.2.15 & 5.3.4	Changing the reporting mode is now be per-request, rather than per-process.

Examples**Example 22.153. Object oriented style**

```
<?php
/* activate reporting */
mysqli_report(MYSQLI_REPORT_ALL);

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli_connect_errno()) {
    printf("Connect failed: %s\n", $mysqli_connect_error());
    exit();
}

/* this query should report an error */
$result = $mysqli->query("SELECT Name FROM Nonexistingtable WHERE population > 50000");

/* this query should report a bad index */
$result = $mysqli->query("SELECT Name FROM City WHERE population > 50000");
$result->close();

$mysqli->close();
?>
```

22.10.3. MySQL Native Driver ([Mysqlind](#))

Copyright 1997-2010 the PHP Documentation Group.

This section of the manual provides an overview of the MySQL Native Driver.

22.10.3.1. Overview

Copyright 1997-2010 the PHP Documentation Group.

MySQL Native Driver is a replacement for the MySQL Client Library (libmysql). MySQL Native Driver is part of the official PHP sources as of PHP 5.3.0.

The MySQL database extensions MySQL extension, [mysqli](#) and PDO MYSQL all communicate with the MySQL server. In the past, this was done by the extension using the services provided by the MySQL Client Library. The extensions were compiled against the MySQL Client Library in order to use its client-server protocol.

With MySQL Native Driver there is now an alternative, as the MySQL database extensions can be compiled to use MySQL Native Driver instead of the MySQL Client Library.

MySQL Native Driver is written in C as a PHP extension.

What it is not

Although MySQL Native Driver is written as a PHP extension, it is important to note that it does not provide a new API to the PHP programmer. The programmer APIs for MySQL database connectivity are provided by the MySQL extension, [mysqli](#) and PDO MYSQL. These extensions can now use the services of MySQL Native Driver to communicate with the MySQL Server. Therefore, you should not think of MySQL Native Driver as an API.

Why use it?

Using the MySQL Native Driver offers a number of advantages over using the MySQL Client Library.

The older MySQL Client Library was written by MySQL AB (now Oracle Corporation) and so was released under the MySQL license. This ultimately led to MySQL support being disabled by default in PHP. However, the MySQL Native Driver has been developed as part of the PHP project, and is therefore released under the PHP license. This removes licensing issues that have been problematic in the past.

Also, in the past, you needed to build the MySQL database extensions against a copy of the MySQL Client Library. This typically meant you needed to have MySQL installed on a machine where you were building the PHP source code. Also, when your PHP application was running, the MySQL database extensions would call down to the MySQL Client library file at run time, so the file needed to be installed on your system. With MySQL Native Driver that is no longer the case as it is included as part of the standard distribution. So you do not need MySQL installed in order to build PHP or run PHP database applications.

Because MySQL Native Driver is written as a PHP extension, it is tightly coupled to the workings of PHP. This leads to gains in efficiency, especially when it comes to memory usage, as the driver uses the PHP memory management system. It also supports the PHP memory limit. Using MySQL Native Driver leads to comparable or better performance than using MySQL Client Library, it always ensures the most efficient use of memory. One example of the memory efficiency is the fact that when using the MySQL Client Library, each row is stored in memory twice, whereas with the MySQL Native Driver each row is only stored once in memory.

Special features

MySQL Native Driver also provides some special features not available when the MySQL database extensions use MySQL Client Library. These special features are listed below:

- Improved persistent connections
- The special function `mysqli_fetch_all`
- Performance statistics calls: `mysqli_get_cache_stats`, `mysqli_get_client_stats`, `mysqli_get_connection_stats`

The performance statistics facility can prove to be very useful in identifying performance bottlenecks.

MySQL Native Driver also allows for persistent connections when used with the `mysqli` extension.

SSL Support

MySQL Native Driver has supported SSL since PHP version 5.3.3

Compressed Protocol Support

As of PHP 5.3.2 MySQL Native Driver supports the compressed client server protocol. MySQL Native Driver did not support this in 5.3.0 and 5.3.1. Extensions such as `ext/mysql`, `ext/mysqli`, that are configured to use MySQL Native Driver, can also take advantage of this feature. Note that `PDO_MYSQL` does *NOT* support compression when used together with mysqld.

Named Pipes Support

Named pipes support for Windows was added in PHP version 5.3.4.

22.10.3.2. Installation

[Copyright 1997-2010 the PHP Documentation Group.](#)

Installation on Unix

By default the MySQL database extensions are configured to use MySQL Client Library. In order to use the MySQL Native Driver, PHP needs to be built specifying that the MySQL database extensions are compiled with MySQL Native Driver support. This is done through configuration options prior to building the PHP source code.

For example, to build the MySQL extension, `mysqli` and PDO MYSQL using the MySQL Native Driver, the following command would be given:

```
./configure --with-mysql=mysqlnd \
--with-mysqli=mysqlnd \
--with-pdo-mysql=mysqlnd \
[other options]
```

Installation on Windows

In the official PHP distributions from 5.3 onwards, MySQL Native Driver is enabled by default, so no additional configuration is required to use it. All MySQL database extensions will use MySQL Native Driver in this case.

22.10.3.3. Runtime Configuration

Copyright 1997-2010 the PHP Documentation Group.

The behaviour of these functions is affected by settings in `php.ini`.

Table 22.19. MySQL Native Driver Configuration Options

Name	Default	Changeable	Changelog
<code>mysqlnd.collect_statistics</code>	"1"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqlnd.collect_memory_statistics</code>	"0"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqlnd.debug</code>	"0"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqlnd.net_read_timeout</code>	"31536000"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqlnd.net_cmd_buffer_size</code>	5.3.0 - "2048", 5.3.1 - "4096"	PHP_INI_SYSTEM	Available since PHP 5.3.0.
<code>mysqlnd.net_read_buffer_size</code>	"32768"	PHP_INI_SYSTEM	Available since PHP 5.3.0.

For further details and definitions of the PHP_INI_* modes, see the [configuration.changes.modes](#).

Here's a short explanation of the configuration directives.

<code>mysqlnd.collect_statistics</code> boolean	Enables the collection of various client statistics which can be accessed through <code>mysqli_get_client_stats</code> , <code>mysqli_get_connection_stats</code> , <code>mysqli_get_cache_stats</code> and are shown in <code>mysqlnd</code> section of the output of the <code>phpinfo</code> function as well. This configuration setting enables all MySQL Native Driver statistics except those relating to memory management.
<code>mysqlnd.collect_memory_statistics</code> boolean	Enable the collection of various memory statistics which can be accessed through <code>mysqli_get_client_stats</code> , <code>mysqli_get_connection_stats</code> , <code>mysqli_get_cache_stats</code> and are shown in <code>mysqlnd</code> section of the output of the <code>phpinfo</code> function as well. This configuration setting enables the memory management statistics within the overall set of MySQL Native Driver statistics .
<code>mysqlnd.debug</code> string	Records communication from all extensions using <code>mysqlnd</code> to the specified log file. The format of the directive is <code>mysqlnd.debug = "option1[,parameter_option1][:option2[,parameter_option2]]"</code> . The options for the format string are as follows:

- A[,file] - Appends trace output to specified file. Also ensures that data is written after each write. This is done by closing and reopening the trace file (this is slow). It helps ensure a complete log file should the application crash.
- a[,file] - Appends trace output to the specified file.
- d - Enables output from DBUG_<N> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
- f[,functions] - Limits debugger actions to the specified list of functions. An empty list of functions implies that all functions are selected.
- F - Marks each debugger output line with the name of the source file containing the macro causing the output.
- i - Marks each debugger output line with the PID of the current process.

- L - Marks each debugger output line with the name of the source file line number of the macro causing the output.
- n - Marks each debugger output line with the current function nesting depth
- o[,file] - Similar to a[,file] but overwrites old file, and does not append.
- O[,file] - Similar to A[,file] but overwrites old file, and does not append.
- t[,N] - Enables function control flow tracing. The maximum nesting depth is specified by N, and defaults to 200.
- x - This option activates profiling.

Example:

```
d:t:x:o,/tmp/mysqlnd.trace
```

Note

This feature is only available with a debug build of PHP. Works on Microsoft Windows if using a debug build of PHP and PHP was built using Microsoft Visual C version 9 and above.

`mysqlnd.net_read_timeout` `mysqlnd` and the MySQL Client Library, `libmysql` use different networking APIs. `mysqlnd` uses PHP streams, whereas `libmysql` uses its own wrapper around the operating level network calls. PHP, by default, sets a read timeout of 60s for streams. This is set via `php.ini.default_socket_timeout`. This default applies to all streams that set no other timeout value. `mysqlnd` does not set any other value and therefore connections of long running queries can be disconnected after `default_socket_timeout` seconds resulting in an error message “2006 - MySQL Server has gone away”. The MySQL Client Library sets a default timeout of $365 * 24 * 3600$ seconds (1 year) and waits for other timeouts to occur, such as TCP/IP timeouts. `mysqlnd` now uses the same very long timeout. The value is configurable through a new `php.ini` setting: `mysqlnd.net_read_timeout`. `mysqlnd.net_read_timeout` gets used by any extension (`ext/mysql`, `ext/mysqli`, `PDO_MySQL`) that uses `mysqlnd`. `mysqlnd` tells PHP Streams to use `mysqlnd.net_read_timeout`. Please note that there may be subtle differences between `MYSQL_OPT_READ_TIMEOUT` from the MySQL Client Library and PHP Streams, for example `MYSQL_OPT_READ_TIMEOUT` is documented to work only for TCP/IP connections and, prior to MySQL 5.1.2, only for Windows. PHP streams may not have this limitation. Please check the streams documentation, if in doubt.

`mysqlnd.net_cmd_buffer_size` `mysqlnd` allocates an internal command/network buffer of `mysqlnd.net_cmd_buffer_size` (in `php.ini`) bytes for every connection. If a MySQL Client Server protocol command, for example, `COM_QUERY` (“normal” query), does not fit into the buffer, `mysqlnd` will grow the buffer to the size required for sending the command. Whenever the buffer gets extended for one connection, `command_buffer_too_small` will be incremented by one.

If `mysqlnd` has to grow the buffer beyond its initial size of `mysqlnd.net_cmd_buffer_size` bytes for almost every connection, you should consider increasing the default size to avoid re-allocations.

The default buffer size is 2048 bytes in PHP 5.3.0. In later versions the default is 4096 bytes. The default can changed either through the `php.ini` setting `mysqlnd.net_cmd_buffer_size` or using `mysqli_options(MYSQLI_OPT_NET_CMD_BUFFER_SIZE, int size)`.

It is recommended that the buffer size be set to no less than 4096 bytes because `mysqlnd` also uses it when reading certain communication packet from MySQL. In PHP 5.3.0, `mysqlnd` will not grow the buffer if MySQL sends a packet that is larger than the current size of the buffer. As a consequence, `mysqlnd` is unable to decode the packet and the client application will get an error. There are only two situations when the packet can be larger than the 2048 bytes default of `mysqlnd.net_cmd_buffer_size` in PHP 5.3.0: the packet transports a very long error message, or the packet holds column meta data from `COM_LIST_FIELD(mysql_list_fields())` and the meta data come from a string column with a very long default value (>1900 bytes).

As of PHP 5.3.2 `mysqlnd` does not allow setting buffers smaller than 4096 bytes.

The value can also be set using `mysqli_option(link, MYSQLI_OPT_NET_CMD_BUFFER_SIZE, size)`.

`mysqlnd.net_read_buffer_size` long

Maximum read chunk size in bytes when reading the body of a MySQL command packet. The MySQL client server protocol encapsulates all its commands in packets. The packets consist of a small header and a body with the actual payload. The size of the body is encoded in the header. `mysqlnd` reads the body in chunks of `MIN(header.size, mysqlnd.net_read_buffer_size)` bytes. If a packet body is larger than `mysqlnd.net_read_buffer_size` bytes, `mysqlnd` has to call `read()` multiple times.

The value can also be set using `mysqli_options(link, MYSQLI_OPT_NET_READ_BUFFER_SIZE, size)`.

22.10.3.4. Persistent Connections

Copyright 1997-2010 the PHP Documentation Group.

Using Persistent Connections

If `mysqli` is used with `mysqlnd`, when a persistent connection is created it generates a `COM_CHANGE_USER` (`mysql_change_user()`) call on the server. This ensures that re-authentication of the connection takes place.

As there is some overhead associated with the `COM_CHANGE_USER` call, it is possible to switch this off at compile time. Reusing a persistent connection will then generate a `COM_PING` (`mysql_ping`) call to simply test the connection is reusable.

Generation of `COM_CHANGE_USER` can be switched off with the compile flag `MYSQLI_NO_CHANGE_USER_ON_PCONNECT`. For example:

```
shell# CFLAGS="-DMYSQLI_NO_CHANGE_USER_ON_PCONNECT" ./configure --with-mysql=/usr/local/mysql/ --with-mysqli=/usr/local
```

Or alternatively:

```
shell# export CFLAGS="-DMYSQLI_NO_CHANGE_USER_ON_PCONNECT"
shell# configure --whatever-option
shell# make clean
shell# make
```

Note that only `mysqli` on `mysqlnd` uses `COM_CHANGE_USER`. Other extension-driver combinations use `COM_PING` on initial use of a persistent connection.

22.10.3.5. Statistics

Copyright 1997-2010 the PHP Documentation Group.

Using Statistical Data

MySQL Native Driver contains support for gathering statistics on the communication between the client and the server. The statistics gathered are of three main types:

- Client statistics
- Connection statistics
- Zval cache statistics

If you are using the `mysqli` extension, these statistics can be obtained through three API calls:

- `mysqli_get_client_stats`
- `mysqli_get_connection_stats`
- `mysqli_get_cache_stats`

Note

Statistics are aggregated among all extensions that use MySQL Native Driver. For example, when compiling both `ext/mysql` and `ext/mysqli` against MySQL Native Driver, both function calls of `ext/mysql` and `ext/mysqli` will change the statistics. There is no way to find out how much a certain API call of any extension that has been compiled against MySQL Native Driver has impacted a certain statistic. You can configure the PDO MySQL Driver, `ext/mysql` and `ext/mysqli` to optionally use the MySQL Native Driver. When doing so, all three extensions will change the statistics.

Accessing Client Statistics

To access client statistics, you need to call `mysqli_get_client_stats`. The function call does not require any parameters.

The function returns an associative array that contains the name of the statistic as the key and the statistical data as the value.

Client statistics can also be accessed by calling the `phpinfo` function.

Accessing Connection Statistics

To access connection statistics call `mysqli_get_connection_stats`. This takes the database connection handle as the parameter.

The function returns an associative array that contains the name of the statistic as the key and the statistical data as the value.

Accessing Zval Cache Statistics

The MySQL Native Driver also collects statistics from its internal Zval cache. These statistics can be accessed by calling `mysqli_get_cache_stats`.

The Zval cache statistics obtained may lead to a tweaking of `php.ini` settings related to the Zval cache, resulting in better performance.

Buffered and Unbuffered Result Sets

Result sets can be buffered or unbuffered. Using default settings, `ext/mysql` and `ext/mysqli` work with buffered result sets for normal (non prepared statement) queries. Buffered result sets are cached on the client. After the query execution all results are fetched from the MySQL Server and stored in a cache on the client. The big advantage of buffered result sets is that they allow the server to free all resources allocated to a result set, once the results have been fetched by the client.

Unbuffered result sets on the other hand are kept much longer on the server. If you want to reduce memory consumption on the client, but increase load on the server, use unbuffered results. If you experience a high server load and the figures for unbuffered result sets are high, you should consider moving the load to the clients. Clients typically scale better than servers. “Load” does not only refer to memory buffers - the server also needs to keep other resources open, for example file handles and threads, before a result set can be freed.

Prepared Statements use unbuffered result sets by default. However, you can use `mysqli_stmt_store_result` to enable buffered result sets.

Statistics returned by MySQL Native Driver

The following tables show a list of statistics returned by the `mysqli_get_client_stats`, `mysqli_get_connection_stats` and `mysqli_get_cache_stats` functions.

Network

Statistic	Scope	Description	Notes
<code>bytes_sent</code>	Connection	Number of bytes sent from PHP to the MySQL server	Can be used to check the efficiency of the compression protocol
<code>bytes_received</code>	Connection	Number of bytes received from MySQL server	Can be used to check the efficiency of the compression protocol
<code>packets_sent</code>	Connection	Number of MySQL Client Server protocol packets sent	Used for debugging Client Server protocol implementation
<code>packets_received</code>	Connection	Number of MySQL Client Server protocol packets received	Used for debugging Client Server protocol implementation
<code>protocol_overhead_in</code>	Connection	MySQL Client Server protocol	Used for debugging Client

Statistic	Scope	Description	Notes
		overhead in bytes for incoming traffic. Currently only the Packet Header (4 bytes) is considered as overhead. protocol_overhead_in = packets_received * 4	Server protocol implementation
protocol_overhead_out	Connection	MySQL Client Server protocol overhead in bytes for outgoing traffic. Currently only the Packet Header (4 bytes) is considered as overhead. protocol_overhead_out = packets_sent * 4	Used for debugging Client Server protocol implementation
bytes_received_ok_packet	Connection	Total size of bytes of MySQL Client Server protocol OK packets received. OK packets can contain a status message. The length of the status message can vary and thus the size of an OK packet is not fixed.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_ok	Connection	Number of MySQL Client Server protocol OK packets received.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
bytes_received_eof_packet	Connection	Total size in bytes of MySQL Client Server protocol EOF packets received. EOF can vary in size depending on the server version. Also, EOF can transport an error message.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_eof	Connection	Number of MySQL Client Server protocol EOF packets. Like with other packet statistics the number of packets will be increased even if PHP does not receive the expected packet but, for example, an error message.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
bytes_received_rset_header_packet	Connection	Total size in bytes of MySQL Client Server protocol result set header packets. The size of the packets varies depending on the payload (LOAD LOCAL INFILE , INSERT , UPDATE , SELECT , error message).	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_rset_header	Connection	Number of MySQL Client Server protocol result set header packets.	Used for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
bytes_received_rset_field_meta_packet	Connection	Total size in bytes of MySQL Client Server protocol result set meta data (field information) packets. Of course the size varies with the fields in the result set. The packet may also transport an error or an EOF packet in case of COM_LIST_FIELDS.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
packets_received_rset_field_meta	Connection	Number of MySQL Client Server protocol result set meta data (field information) packets.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header

Statistic	Scope	Description	Notes
			packet (4 bytes, see protocol overhead).
<code>bytes_received_rset_row_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol result set row data packets. The packet may also transport an error or an EOF packet. You can reverse engineer the number of error and EOF packets by subtracting <code>rows_fetched_from_server_normal</code> and <code>rows_fetched_from_server_ps</code> from <code>bytes_received_rset_row_packet</code> .	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_rset_row</code>	Connection	Number of MySQL Client Server protocol result set row data packets and their total size in bytes.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_prepare_response_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol OK for Prepared Statement Initialization packets (prepared statement init packets). The packet may also transport an error. The packet size depends on the MySQL version: 9 bytes with MySQL 4.1 and 12 bytes from MySQL 5.0 on. There is no safe way to know how many errors happened. You may be able to guess that an error has occurred if, for example, you always connect to MySQL 5.0 or newer and, <code>bytes_received_prepare_response_packet != packets_received_prepare_response * 12</code> . See also <code>ps_prepared_never_executed</code> , <code>ps_prepared_once_executed</code> .	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_prepare_response</code>	Connection	Number of MySQL Client Server protocol OK for Prepared Statement Initialization packets (prepared statement init packets).	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>bytes_received_change_user_packet</code>	Connection	Total size in bytes of MySQL Client Server protocol COM_CHANGE_USER packets. The packet may also transport an error or EOF.	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).
<code>packets_received_change_user</code>	Connection	Number of MySQL Client Server protocol COM_CHANGE_USER packets	Only useful for debugging CS protocol implementation. Note that the total size in bytes includes the size of the header packet (4 bytes, see protocol overhead).

Statistic	Scope	Description	Notes
<code>packets_sent_command</code>	Connection	Number of MySQL Client Server protocol commands sent from PHP to MySQL. There is no way to know which specific commands and how many of them have been sent. At its best you can use it to check if PHP has sent any commands to MySQL to know if you can consider to disable MySQL support in your PHP binary. There is also no way to reverse engineer the number of errors that may have occurred while sending data to MySQL. The only error recoded is command_buffer_too_small (see below).	Only useful for debugging CS protocol implementation.
<code>bytes_received_real_data_normal</code>	Connection	Number of bytes of payload fetched by the PHP client from <code>mysqlnd</code> using the text protocol.	<p>This is the size of the actual data contained in result sets that do not originate from prepared statements and which have been fetched by the PHP client. Note that although a full result set may have been pulled from MySQL by <code>mysqlnd</code>, this statistic only counts actual data pulled from <code>mysqlnd</code> by the PHP client. An example of a code sequence that will increase the value is as follows:</p> <pre>\$mysqli = new mysqli(); \$res = \$mysqli->query("SELECT 'abc'"); \$res->fetch_assoc(); \$res->close();</pre> <p>Every fetch operation will increase the value.</p> <p>The statistic will not be increased if the result set is only buffered on the client, but not fetched, such as in the following example:</p> <pre>\$mysqli = new mysqli(); \$res = \$mysqli->query("SELECT 'abc'"); \$res->close();</pre> <p>This statistic is available as of PHP version 5.3.4.</p>
<code>bytes_received_real_data_ps</code>	Connection	Number of bytes of the payload fetched by the PHP client from <code>mysqlnd</code> using the prepared statement protocol.	This is the size of the actual data contained in result sets that originate from prepared statements and which has been fetched by the PHP client. The value will not be increased if the result set is not subsequently read by the PHP client. Note that although a full result set may have been pulled from MySQL by <code>mysqlnd</code> , this statistic only counts actual data pulled from <code>mysqlnd</code> by the PHP client. See also <code>bytes_received_real_data_normal</code> . This statistic is

Statistic	Scope	Description	Notes
			available as of PHP version 5.3.4.

Result Set

Statistic	Scope	Description	Notes
<code>result_set_queries</code>	Connection	Number of queries that have generated a result set. Examples of queries that generate a result set: <code>SELECT</code> , <code>SHOW</code> . The statistic will not be incremented if there is an error reading the result set header packet from the line.	You may use it as an indirect measure for the number of queries PHP has sent to MySQL, for example, to identify a client that causes a high database load.
<code>non_result_set_queries</code>	Connection	Number of queries that did not generate a result set. Examples of queries that do not generate a result set: <code>INSERT</code> , <code>UPDATE</code> , <code>LOAD DATA</code> , <code>SHOW</code> . The statistic will not be incremented if there is an error reading the result set header packet from the line.	You may use it as an indirect measure for the number of queries PHP has sent to MySQL, for example, to identify a client that causes a high database load.
<code>no_index_used</code>	Connection	Number of queries that have generated a result set but did not use an index (see also mysqld start option <code>-log-queries-not-using-indexes</code>). If you want these queries to be reported you can use <code>mysqli_report(MYSQLI_REPORT_INDEX)</code> to make ext/mysqli throw an exception. If you prefer a warning instead of an exception use <code>mysqli_report(MYSQLI_REPORT_INDEX ^ MYSQLI_REPORT_STRICT)</code> .	
<code>bad_index_used</code>	Connection	Number of queries that have generated a result set and did not use a good index (see also mysqld start option <code>-log-slow-queries</code>).	If you want these queries to be reported you can use <code>mysqli_report(MYSQLI_REPORT_INDEX)</code> to make ext/mysqli throw an exception. If you prefer a warning instead of an exception use <code>mysqli_report(MYSQLI_REPORT_INDEX ^ MYSQLI_REPORT_STRICT)</code>
<code>slow_queries</code>	Connection	SQL statements that took more than <code>long_query_time</code> seconds to execute and required at least <code>min_examined_row_limit</code> rows to be examined.	Not reported through <code>mysqli_report</code>
<code>buffered_sets</code>	Connection	Number of buffered result sets returned by “normal” queries. “Normal” means “not prepared statement” in the following notes.	Examples of API calls that will buffer result sets on the client: <code>mysql_query</code> , <code>mysqli_query</code> , <code>mysqli_store_result</code> , <code>mysqli_stmt_get_result</code> . Buffering result sets on the client ensures that server resources are freed as soon as possible and it makes result set

Statistic	Scope	Description	Notes
			scrolling easier. The downside is the additional memory consumption on the client for buffering data. Note that mysqld (unlike the MySQL Client Library) respects the PHP memory limit because it uses PHP internal memory management functions to allocate memory. This is also the reason why memory_get_usage reports a higher memory consumption when using mysqld instead of the MySQL Client Library. memory_get_usage does not measure the memory consumption of the MySQL Client Library at all because the MySQL Client Library does not use PHP internal memory management functions monitored by the function!
unbuffered_sets	Connection	Number of unbuffered result sets returned by normal (non prepared statement) queries.	Examples of API calls that will not buffer result sets on the client: mysqli_use_result
ps_buffered_sets	Connection	Number of buffered result sets returned by prepared statements. By default prepared statements are unbuffered.	Examples of API calls that will not buffer result sets on the client: mysqli_stmt_store_result
ps_unbuffered_sets	Connection	Number of unbuffered result sets returned by prepared statements.	By default prepared statements are unbuffered.
flushed_normal_sets	Connection	Number of result sets from normal (non prepared statement) queries with unread data which have been flushed silently for you. Flushing happens only with unbuffered result sets.	<p>Unbuffered result sets must be fetched completely before a new query can be run on the connection otherwise MySQL will throw an error. If the application does not fetch all rows from an unbuffered result set, mysqld does implicitly fetch the result set to clear the line. See also rows_skipped_normal, rows_skipped_ps. Some possible causes for an implicit flush:</p> <ul style="list-style-type: none"> • Faulty client application • Client stopped reading after it found what it was looking for but has made MySQL calculate more records than needed • Client application has stopped unexpectedly
flushed_ps_sets	Connection	Number of result sets from prepared statements with unread data which have been flushed silently for you. Flushing happens only with unbuffered result sets.	Unbuffered result sets must be fetched completely before a new query can be run on the connection otherwise MySQL will throw an error. If the application does not fetch all

Statistic	Scope	Description	Notes
			<p>rows from an unbuffered result set, mysqld does implicitly fetch the result set to clear the line. See also rows_skipped_normal, rows_skipped_ps. Some possible causes for an implicit flush:</p> <ul style="list-style-type: none"> • Faulty client application • Client stopped reading after it found what it was looking for but has made MySQL calculate more records than needed • Client application has stopped unexpectedly
ps_prepared_never_executed	Connection	Number of statements prepared but never executed.	Prepared statements occupy server resources. You should not prepare a statement if you do not plan to execute it.
ps_prepared_once_executed	Connection	Number of prepared statements executed only one.	One of the ideas behind prepared statements is that the same query gets executed over and over again (with different parameters) and some parsing and other preparation work can be saved, if statement execution is split up in separate prepare and execute stages. The idea is to prepare once and "cache" results, for example, the parse tree to be reused during multiple statement executions. If you execute a prepared statement only once the two stage processing can be inefficient compared to "normal" queries because all the caching means extra work and it takes (limited) server resources to hold the cached information. Consequently, prepared statements that are executed only once may cause performance hurts.
rows_fetched_from_server_normal , rows_fetched_from_server_ps	Connection	Total number of result set rows successfully fetched from MySQL regardless if the client application has consumed them or not. Some of the rows may not have been fetched by the client application but have been flushed implicitly.	See also pack-sets_received_rset_row
rows_buffered_from_client_normal , rows_buffered_from_client_ps	Connection	Total number of successfully buffered rows originating from a "normal" query or a prepared statement. This is the number of rows that have been fetched from MySQL and buffered on client. Note that there are two distinct statistics on rows that	Examples of queries that will buffer results: mysqli_query , mysqli_store_result

Statistic	Scope	Description	Notes
		have been buffered (MySQL to mysqlnd internal buffer) and buffered rows that have been fetched by the client application (mysqlnd internal buffer to client application). If the number of buffered rows is higher than the number of fetched buffered rows it can mean that the client application runs queries that cause larger result sets than needed resulting in rows not read by the client.	
<code>rows_fetched_from_client_normal_buffered,</code> <code>rows_fetched_from_client_ps_buffered</code>	Connection	Total number of rows fetched by the client from a buffered result set created by a normal query or a prepared statement.	
<code>rows_fetched_from_cli</code>	Connection	Total number of rows fetched by the client from an unbuffered result set created by a "normal" query or a prepared statement.	

Statistic	Scope	Description	Notes
<code>, rows_fetched_from_client_ps_unbuffered</code>			
<code>rows_fetched_from_client_ps_cursor</code>	Connection	Total number of rows fetch by the client from a cursor created by a prepared statement.	
<code>rows_skipped_normal, rows_skipped_ps</code>	Connection	Reserved for future use (currently not supported)	
<code>copy_on_write_saved, copy_on_write_performed</code>	Process	With mysqlnd, variables returned by the extensions point into mysqlnd internal network result buffers. If you do not change the variables, fetched data will be kept only once in memory. If you change the variables, mysqlnd has to perform a copy-on-write to protect the internal network result buffers from being changed. With the MySQL Client Library you always hold fetched data twice in memory. Once in the internal MySQL Client Library buffers and once in the variables returned by the extensions. In theory mysqlnd can save up to 40% memory. However, note that the memory saving cannot be measured using <code>memory_get_usage</code> .	
<code>explicit_free_result, implicit_free_result</code>	Connection, Process (only during prepared statement cleanup)	Total number of freed result sets.	The free is always considered explicit but for result sets created by an init command, for example, <code>mysqli_options(MYSQLI_INIT_COMMAND , ...)</code>
<code>proto_text_fetched_null, proto_text_fetched_bit, proto_text_fetched_tinyint proto_text_fetched_short, proto_text_fetched_int24, proto_text_fetched_int proto_text_fetched_bigint, proto_text_fetched_decimal, proto_text_fetched_float proto_text_fetched_double, proto_text_fetched_date, proto_text_fetched_year proto_text_fetched_time, proto_text_fetched_datetime, proto_text_fetched_timestamp</code>	Connection	Total number of columns of a certain type fetched from a normal query (MySQL text protocol).	Mapping from C API / MySQL meta data type to statistics name: <ul style="list-style-type: none"> • <code>MYSQL_TYPE_NULL</code> - <code>proto_text_fetched_null</code> • <code>MYSQL_TYPE_BIT</code> - <code>proto_text_fetched_bit</code> • <code>MYSQL_TYPE_TINY</code> - <code>proto_text_fetched_tinyint</code> • <code>MYSQL_TYPE_SHORT</code> - <code>proto_text_fetched_short</code> • <code>MYSQL_TYPE_INT24</code> - <code>proto_text_fetched_int24</code> • <code>MYSQL_TYPE_LONG</code> - <code>proto_text_fetched_int</code> • <code>MYSQL_TYPE_LONGLONG</code> - <code>proto_text_fetched_bigint</code> • <code>MYSQL_TYPE_DECIMAL</code>, <code>MYSQL_TYPE_NEWDECIMAL</code> -

Statistic	Scope	Description	Notes
<code>mestamp</code> <code>proto_text_fetched_string,</code> <code>proto_text_fetched_blob,</code> <code>proto_text_fetched_enum</code> <code>proto_text_fetched_set,</code> <code>proto_text_fetched_geometry,</code> <code>proto_text_fetched_other</code>			<p>proto_text_fetched_decimal</p> <ul style="list-style-type: none"> • <code>MYSQL_TYPE_FLOAT</code> - <code>proto_text_fetched_float</code> • <code>MYSQL_TYPE_DOUBLE</code> - <code>proto_text_fetched_double</code> • <code>MYSQL_TYPE_DATE</code>, <code>MYSQL_TYPE_NEWDATE</code> - <code>proto_text_fetched_date</code> • <code>MYSQL_TYPE_YEAR</code> - <code>proto_text_fetched_year</code> • <code>MYSQL_TYPE_TIME</code> - <code>proto_text_fetched_time</code> • <code>MYSQL_TYPE_DATETIME</code> - <code>proto_text_fetched_datetime</code> • <code>MYSQL_TYPE_TIMESTAMP</code> - <code>proto_text_fetched_timestamp</code> • <code>MYSQL_TYPE_STRING</code>, <code>MYSQL_TYPE_VARSTRING</code>, <code>MYSQL_TYPE_VARCHAR</code> - <code>proto_text_fetched_string</code> • <code>MYSQL_TYPE_TINY_BLOB</code>, <code>MYSQL_TYPE_MEDIUM_BLOB</code>, <code>MYSQL_TYPE_LONG_BLOB</code>, <code>MYSQL_TYPE_BLOB</code> - <code>proto_text_fetched_blob</code> • <code>MYSQL_TYPE_ENUM</code> - <code>proto_text_fetched_enum</code> • <code>MYSQL_TYPE_SET</code> - <code>proto_text_fetched_set</code> • <code>MYSQL_TYPE_GEOMETRY</code> - <code>proto_text_fetched_geometry</code> • Any <code>MYSQL_TYPE_*</code> not listed before (there should be none) - <code>proto_text_fetched_other</code> <p>Note that the <code>MYSQL_*</code>-type constants may not be associated with the very same SQL column types in every version of MySQL.</p>
<code>proto_binary_fetched_null,</code> <code>proto_binary_fetched_bit,</code>	Connection	Total number of columns of a certain type fetched from a prepared statement (MySQL binary protocol).	For type mapping see <code>proto_text_*</code> described in the preceding text.

Statistic	Scope	Description	Notes
<code>proto_binary_fetched_tinyint</code> <code>proto_binary_fetched_short</code> , <code>proto_binary_fetched_int24</code> , <code>proto_binary_fetched_int</code> , <code>proto_binary_fetched_bigint</code> , <code>proto_binary_fetched_decimal</code> , <code>proto_binary_fetched_float</code> , <code>proto_binary_fetched_double</code> , <code>proto_binary_fetched_date</code> , <code>proto_binary_fetched_year</code> , <code>proto_binary_fetched_time</code> , <code>proto_binary_fetched_datetime</code> , <code>proto_binary_fetched_timestamp</code> , <code>proto_binary_fetched_string</code> , <code>proto_binary_fetched_blob</code> , <code>proto_binary_fetched_enum</code> , <code>proto_binary_fetched_set</code> , <code>proto_binary_fetched_geometry</code> , <code>proto_binary_fetched_other</code>			

Connection

Statistic	Scope	Description	Notes
<code>connect_success</code> , <code>connect_failure</code>	Connection	Total number of successful / failed connection attempt.	Reused connections and all other kinds of connections are included.
<code>reconnect</code>	Process	Total number of (real_)connect attempts made on an already opened connection handle.	The code sequence <code>\$link = new mysqli(...); \$link->real_connect(...)</code> will cause a reconnect. But <code>\$link = new mysqli(...); \$link->connect(...)</code> will not because <code>\$link->connect(...)</code> will explicitly close the existing connection before a new connection is established.
<code>pconnect_success</code>	Connection	Total number of successful persistent connection attempts.	Note that <code>connect_success</code> holds the sum of successful persistent and non-persistent connection attempts. The number of successful non-persistent connection attempts is <code>connect_success - pconnect_success</code> .

Statistic	Scope	Description	Notes
			<code>nect_success.</code>
<code>active_connections</code>	Connection	Total number of active persistent and non-persistent connections.	
<code>act-ive_persistent_connec-tions</code>	Connection	Total number of active persistent connections.	The total number of active non-persistent connections is <code>active_connections - active_persistent_connec-tions</code> .
<code>explicit_close</code>	Connection	Total number of explicitly closed connections (ext/mysql only).	Examples of code snippets that cause an explicit close : <code>\$link = new mysqli(...); \$link->close();</code> <code>\$link = new mysqli(...); \$link->connec-tion_close();</code>
<code>implicit_close</code>	Connection	Total number of implicitly closed connections (ext/mysql only).	Examples of code snippets that cause an implicit close : <ul style="list-style-type: none"> • <code>\$link = new mysqli(...); \$link->real_connect(...);</code> • <code>unset(\$link)</code> • Persistent connection: pooled connection has been created with <code>real_connect</code> and there may be unknown options set - close implicitly to avoid returning a connection with unknown options • Persistent connection: <code>ping</code>, <code>change_user</code> fails and ext/mysql closes the connection • end of script execution: close connections that have not been closed by the user
<code>disconnect_close</code>	Connection	Connection failures indicated by the C API call <code>mysql_real_connect</code> during an attempt to establish a connection.	It is called <code>discon-nect_close</code> because the connection handle passed to the C API call will be closed.
<code>in_middle_of_command_close</code>	Process	A connection has been closed in the middle of a command execution (outstanding result sets not fetched, after sending a query and before retrieving an answer, while fetching data, while transferring data with LOAD DATA).	Unless you use asynchronous queries this should only happen if your script stops unexpectedly and PHP shuts down the connections for you.
<code>init_command_executed_count</code>	Connection	Total number of init command executions, for example, <code>mysqli_options(MYSQLI_INIT_COMMAND , ...)</code> .	The number of successful executions is <code>init_command_executed_count - init_command_failed_count</code> .
<code>init_command_failed_c</code>	Connection	Total number of failed init	

Statistic	Scope	Description	Notes
<code>count</code>		commands.	

*COM_** Commands

Statistic	Scope	Description	Notes
<code>com_quit, com_init_db, com_query, com_field_list, com_create_db, com_drop_db, com_refresh, com_shutdown, com_statistics, com_process_info, com_connect, com_process_kill, com_debug, com_ping, com_time, com_delayed_insert, com_change_user, com_binlog_dump, com_table_dump, com_connect_out, com_register_slave, com_stmt_prepare, com_stmt_execute, com_stmt_send_long_data, com_stmt_close, com_stmt_reset, com_stmt_set_option, com_stmt_fetch, com_daemon</code>	Connection	Total number of attempts to send a certain COM_* command from PHP to MySQL.	<p>The statistics are incremented after checking the line and immediately before sending the corresponding MySQL client server protocol packet. If mysqld fails to send the packet over the wire the statistics will not be decremented. In case of a failure mysqld emits a PHP warning “Error while sending %s packet. PID=%d.”</p> <p>Usage examples:</p> <ul style="list-style-type: none"> Check if PHP sends certain commands to MySQL, for example, check if a client sends <code>COM_PROCESS_KILL</code> Calculate the average number of prepared statement executions by comparing <code>COM_EXECUTE</code> with <code>COM_PREPARE</code> Check if PHP has run any non-prepared SQL statements by checking if <code>COM_QUERY</code> is zero Identify PHP scripts that run an excessive number of SQL statements by checking <code>COM_QUERY</code> and <code>COM_EXECUTE</code>

Miscellaneous

Statistic	Scope	Description	Notes
<code>explicit_stmt_close, implicit_stmt_close</code>	Process	Total number of close prepared statements.	A close is always considered explicit but for a failed prepare.
<code>mem_emalloc_count, mem_emalloc_amount, mem_ecalloc_count, mem_ecalloc_amount, mem_erealloc_count, mem_erealloc_amount, mem_efree_count, mem_malloc_count, mem_malloc_amount, mem_calloc_count, mem_calloc_amount, mem_realloc_count, mem_realloc_amount, mem_free_count</code>	Process	Memory management calls.	Development only.

Statistic	Scope	Description	Notes
<code>com-command_buffer_too_small</code>	Connection	<p>Number of network command buffer extensions while sending commands from PHP to MySQL.</p>	<p>mysqld allocates an internal command/network buffer of <code>mysqlnd.net_cmd_buffer_size (php.ini)</code> bytes for every connection. If a MySQL Client Server protocol command, for example, <code>COM_QUERY</code> (normal query), does not fit into the buffer, mysqld will grow the buffer to what is needed for sending the command. Whenever the buffer gets extended for one connection <code>com-command_buffer_too_small</code> will be incremented by one.</p> <p>If mysqld has to grow the buffer beyond its initial size of <code>mysqlnd.net_cmd_buffer_size (php.ini)</code> bytes for almost every connection, you should consider to increase the default size to avoid re-allocations.</p> <p>The default buffer size is 2048 bytes in PHP 5.3.0. In future versions the default will be 4kB or larger. The default can changed either through the <code>php.ini</code> setting <code>mysqlnd.net_cmd_buffer_size</code> or using <code>mysqli_options(MYSQLI_OPT_NET_CMD_BUFFER_SIZE, int size)</code>.</p> <p>It is recommended to set the buffer size to no less than 4096 bytes because mysqld also uses it when reading certain communication packet from MySQL. In PHP 5.3.0, mysqld will not grow the buffer if MySQL sends a packet that is larger than the current size of the buffer. As a consequence mysqld is unable to decode the packet and the client application will get an error. There are only two situations when the packet can be larger than the 2048 bytes default of <code>mysqlnd.net_cmd_buffer_size</code> in PHP 5.3.0: the packet transports a very long error message or the packet holds column meta data from <code>COM_LIST_FIELD</code> (<code>mysql_list_fields</code>) and the meta data comes from a string column with a very long default value (>1900 bytes). No bug report on this exists - it should happen rarely.</p>

Statistic	Scope	Description	Notes
			As of PHP 5.3.2 mysqlnd does not allow setting buffers smaller than 4096 bytes.
connection_reused			

22.10.3.6. Notes

Copyright 1997-2010 the PHP Documentation Group.

This section provides a collection of miscellaneous notes on MySQL Native Driver usage.

- Using [mysqlnd](#) means using PHP streams for underlying connectivity. For [mysqlnd](#), the PHP streams documentation ([book.stream](#)) should be consulted on such details as timeout settings, not the documentation for the MySQL Client Library.

22.10.3.7. MySQL Native Driver Plugin API

Copyright 1997-2010 the PHP Documentation Group.

The MySQL Native Driver Plugin API is a feature of MySQL Native Driver, or [mysqlnd](#). [Mysqlnd](#) plugins operate in the layer between PHP applications and the MySQL server. This is comparable to MySQL Proxy. MySQL Proxy operates on a layer between any MySQL client application, for example, a PHP application and, the MySQL server. [Mysqlnd](#) plugins can undertake typical MySQL Proxy tasks such as load balancing, monitoring and performance optimizations. Due to the different architecture and location, [mysqlnd](#) plugins do not have some of MySQL Proxy's disadvantages. For example, with plugins, there is no single point of failure, no dedicated proxy server to deploy, and no new programming language to learn (Lua).

A [mysqlnd](#) plugin can be thought of as an extension to [mysqlnd](#). Plugins can intercept the majority of [mysqlnd](#) functions. The [mysqlnd](#) functions are called by the PHP MySQL extensions such as [ext/mysql](#), [ext/mysqlnd](#), and [PDO_MYSQL](#). As a result, it is possible for a [mysqlnd](#) plugin to intercept all calls made to these extensions from the client application.

Internal [mysqlnd](#) function calls can also be intercepted, or replaced. There are no restrictions on manipulating [mysqlnd](#) internal function tables. It is possible to set things up so that when certain [mysqlnd](#) functions are called by the extensions that use [mysqlnd](#), the call is directed to the appropriate function in the [mysqlnd](#) plugin. The ability to manipulate [mysqlnd](#) internal function tables in this way allows maximum flexibility for plugins.

[Mysqlnd](#) plugins are in fact PHP Extensions, written in C, that use the [mysqlnd](#) plugin API (which is built into MySQL Native Driver, [mysqlnd](#)). Plugins can be made 100% transparent to PHP applications. No application changes are needed because plugins operate on a different layer. The [mysqlnd](#) plugin can be thought of as operating in a layer below [mysqlnd](#).

The following list represents some possible applications of [mysqlnd](#) plugins.

- Load Balancing
 - Read/Write Splitting. An example of this is the PECL/mysqlnd_ms (Master Slave) extension. This extension splits read/write queries for a replication setup.
 - Failover
 - Round-Robin, least loaded
- Monitoring
 - Query Logging
 - Query Analysis
- Query Auditing. An example of this is the PECL/mysqlnd_sip (SQL Injection Protection) extension. This extension inspects queries and executes only those that are allowed according to a ruleset.
- Performance
 - Caching. An example of this is the PECL/mysqlnd_qc (Query Cache) extension.
 - Throttling

- Sharding. An example of this is the PECL/mysqlnd_mc (Multi Connect) extension. This extension will attempt to split a SELECT statement into n-parts, using SELECT ... LIMIT part_1, SELECT LIMIT part_n. It sends the queries to distinct MySQL servers and merges the result at the client.

MySQL Native Driver Plugins Available

There are a number of mysqlnd plugins already available. These include:

- *PECL/mysqlnd_mc* - Multi Connect plugin.
- *PECL/mysqlnd_ms* - Master Slave plugin.
- *PECL/mysqlnd qc* - Query Cache plugin.
- *PECL/mysqlnd_pscache* - Prepared Statement Handle Cache plugin.
- *PECL/mysqlnd_sip* - SQL Injection Protection plugin.
- *PECL/mysqlnd_uh* - User Handler plugin.

22.10.3.7.1. A comparison of mysqlnd plugins with MySQL Proxy

[Copyright 1997-2010 the PHP Documentation Group.](#)

[Mysqlnd](#) plugins and MySQL Proxy are different technologies using different approaches. Both are valid tools for solving a variety of common tasks such as load balancing, monitoring, and performance enhancements. An important difference is that MySQL Proxy works with all MySQL clients, whereas [mysqlnd](#) plugins are specific to PHP applications.

As a PHP Extension, a [mysqlnd](#) plugin gets installed on the PHP application server, along with the rest of PHP. MySQL Proxy can either be run on the PHP application server or can be installed on a dedicated machine to handle multiple PHP application servers.

Deploying MySQL Proxy on the application server has two advantages:

1. No single point of failure
2. Easy to scale out (horizontal scale out, scale by client)

MySQL Proxy (and [mysqlnd](#) plugins) can solve problems easily which otherwise would have required changes to existing applications.

However, MySQL Proxy does have some disadvantages:

- MySQL Proxy is a new component and technology to master and deploy.
- MySQL Proxy requires knowledge of the Lua scripting language.

MySQL Proxy can be customized with C and Lua programming. Lua is the preferred scripting language of MySQL Proxy. For most PHP experts Lua is a new language to learn. A [mysqlnd](#) plugin can be written in C. It is also possible to write plugins in PHP using [PECL/mysqlnd uh](#).

MySQL Proxy runs as a daemon - a background process. MySQL Proxy can recall earlier decisions, as all state can be retained. However, a [mysqlnd](#) plugin is bound to the request-based lifecycle of PHP. MySQL Proxy can also share one-time computed results among multiple application servers. A [mysqlnd](#) plugin would need to store data in a persistent medium to be able to do this. Another daemon would need to be used for this purpose, such as Memcache. This gives MySQL Proxy an advantage in this case.

MySQL Proxy works on top of the wire protocol. With MySQL Proxy you have to parse and reverse engineer the MySQL Client Server Protocol. Actions are limited to those that can be achieved by manipulating the communication protocol. If the wire protocol changes (which happens very rarely) MySQL Proxy scripts would need to be changed as well.

[Mysqlnd](#) plugins work on top of the C API, which mirrors the [libmysql](#) client and Connector/C APIs. This C API is basically a wrapper around the MySQL Client Server protocol, or wire protocol, as it is sometimes called. You can intercept all C API calls. PHP makes use of the C API, therefore you can hook all PHP calls, without the need to program at the level of the wire protocol.

`Mysqld` implements the wire protocol. Plugins can therefore parse, reverse engineer, manipulate and even replace the communication protocol. However, this is usually not required.

As plugins allow you to create implementations that use two levels (C API and wire protocol), they have greater flexibility than MySQL Proxy. If a `mysqlnd` plugin is implemented using the C API, any subsequent changes to the wire protocol do not require changes to the plugin itself.

22.10.3.7.2. Obtaining the mysqlnd plugin API

Copyright 1997-2010 the PHP Documentation Group.

The `mysqlnd` plugin API is simply part of the MySQL Native Driver PHP extension, [ext/mysqlnd](#). Development started on the `mysqlnd` plugin API in December 2009. It is developed as part of the PHP source repository, and as such is available to the public either via SVN, or through source snapshot downloads.

The following table shows PHP versions and the corresponding `mysqlnd` version contained within.

PHP Version	MySQL Native Driver version
5.3.0	5.0.5
5.3.1	5.0.5
5.3.2	5.0.7
5.3.3	5.0.7
5.3.4	5.0.7

Plugin developers can determine the `mysqlnd` version through accessing `MYSQLND_VERSION`, which is a string of the format “`mysqlnd 5.0.7-dev - 091210 - $Revision: 300535`”, or through `MYSQLND_VERSION_ID`, which is an integer such as 50007. Developers can calculate the version number as follows:

Version (part)	Example
Major*10000	$5*10000 = 50000$
Minor*100	$0*100 = 0$
Patch	$7 = 7$
MYSQLND_VERSION_ID	50007

During development, developers should refer to the `mysqlnd` version number for compatibility and version tests, as several iterations of `mysqlnd` could occur during the lifetime of a PHP development branch with a single PHP version number.

22.10.3.7.3. MySQL Native Driver Plugin Architecture

Copyright 1997-2010 the PHP Documentation Group.

This section provides an overview of the `mysqlnd` plugin architecture.

MySQL Native Driver Overview

Before developing `mysqlnd` plugins, it is useful to know a little of how `mysqlnd` itself is organized. `Mysqld` consists of the following modules:

Modules Statistics	<code>mysqlnd_statistics.c</code>
Connection	<code>mysqlnd.c</code>
Resultset	<code>mysqlnd_result.c</code>
Resultset Metadata	<code>mysqlnd_result_meta.c</code>
Statement	<code>mysqlnd_ps.c</code>
Network	<code>mysqlnd_net.c</code>
Wire protocol	<code>mysqlnd_wireprotocol.c</code>

C Object Oriented Paradigm

At the code level, `mysqlnd` uses a C pattern for implementing object orientation.

In C you use a `struct` to represent an object. Members of the struct represent object properties. Struct members pointing to functions represent methods.

Unlike with other languages such as C++ or Java, there are no fixed rules on inheritance in the C object oriented paradigm. However, there are some conventions that need to be followed that will be discussed later.

The PHP Life Cycle

When considering the PHP life cycle there are two basic cycles:

- PHP engine startup and shutdown cycle
- Request cycle

When the PHP engine starts up it will call the module initialization (MINIT) function of each registered extension. This allows each module to setup variables and allocate resources that will exist for the lifetime of the PHP engine process. When the PHP engine shuts down it will call the module shutdown (MSHUTDOWN) function of each extension.

During the lifetime of the PHP engine it will receive a number of requests. Each request constitutes another life cycle. On each request the PHP engine will call the request initialization function of each extension. The extension can perform any variable setup and resource allocation required for request processing. As the request cycle ends the engine calls the request shutdown (RSHUTDOWN) function of each extension so the extension can perform any cleanup required.

How a plugin works

A `mysqlnd` plugin works by intercepting calls made to `mysqlnd` by extensions that use `mysqlnd`. This is achieved by obtaining the `mysqlnd` function table, backing it up, and replacing it by a custom function table, which calls the functions of the plugin as required.

The following code shows how the `mysqlnd` function table is replaced:

```
/* a place to store orginal function table */
struct st_mysqlnd_conn_methods org_methods;

void minit_register_hooks(TSRMLS_D) {
    /* active function table */
    struct st_mysqlnd_conn_methods * current_methods
        = mysqlnd_conn_get_methods();

    /* backup original function table */
    memcpy(&org_methods, current_methods,
           sizeof(struct st_mysqlnd_conn_methods));

    /* install new methods */
    current_methods->query = MYSQLND_METHOD(my_conn_class, query);
}
```

Connection function table manipulations must be done during Module Initialization (MINIT). The function table is a global shared resource. In a multi-threaded environment, with a TSRM build, the manipulation of a global shared resource during the request processing will almost certainly result in conflicts.

Note

Do not use any fixed-size logic when manipulating the `mysqlnd` function table: new methods may be added at the end of the function table. The function table may change at any time in the future.

Calling parent methods

If the original function table entries are backed up, it is still possible to call the original function table entries - the parent methods.

In some cases, such as for `Connection::stmt_init()`, it is vital to call the parent method prior to any other activity in the derived method.

```
MYSQLND_METHOD(my_conn_class, query)(MYSQLND *conn,
    const char *query, unsigned int query_len TSRMLS_DC) {
    php_printf("my_conn_class::query(query = %s)\n", query);
    query = "SELECT 'query rewritten' FROM DUAL";
    query_len = strlen(query);

    return org_methods.query(conn, query, query_len); /* return with call to parent */
}
```

Extending properties

A `mysqlnd` object is represented by a C struct. It is not possible to add a member to a C struct at run time. Users of `mysqlnd` objects cannot simply add properties to the objects.

Arbitrary data (properties) can be added to a `mysqlnd` objects using an appropriate function of the `mysqlnd_plugin_get_plugin_<object>_data()` family. When allocating an object `mysqlnd` reserves space at the end of the object to hold a `void *` pointer to arbitrary data. `mysqlnd` reserves space for one `void *` pointer per plugin.

The following table shows how to calculate the position of the pointer for a specific plugin:

Memory address	Contents
0	Beginning of the <code>mysqlnd</code> object C struct
n	End of the <code>mysqlnd</code> object C struct
n + (m x sizeof(void*))	<code>void*</code> to object data of the m-th plugin

If you plan to subclass any of the `mysqlnd` object constructors, which is allowed, you must keep this in mind!

The following code shows extending properties:

```

/* any data we want to associate */
typedef struct my_conn_properties {
    unsigned long query_counter;
} MY_CONN_PROPERTIES;

/* plugin id */
unsigned int my_plugin_id;

void minit_register_hooks(TSRMLS_D) {
    /* obtain unique plugin ID */
    my_plugin_id = mysqlnd_plugin_register();
    /* snip - see Extending Connection: methods */
}

static MY_CONN_PROPERTIES** get_conn_properties(const MYSQLND *conn TSRMLS_DC) {
    MY_CONN_PROPERTIES** props;
    props = (MY_CONN_PROPERTIES**)mysqlnd_plugin_get_plugin_connection_data(
        conn, my_plugin_id);
    if (!props || !(*props)) {
        *props = mnd_palloc(1, sizeof(MY_CONN_PROPERTIES), conn->persistent);
        (*props)->query_counter = 0;
    }
    return props;
}

```

The plugin developer is responsible for the management of plugin data memory.

Use of the `mysqlnd` memory allocator is recommended for plugin data. These functions are named using the convention: `mnd_*loc()`. The `mysqlnd` allocator has some useful features, such as the ability to use a debug allocator in a non-debug build.

When and how to subclass

	When to subclass?	Each instance has its own private function table?	How to subclass?
Connection (MYSQLND)	MINIT	No	<code>mysqlnd_conn_get_methods()</code>
Resultset (MYSQLND_RES)	MINIT or later	Yes	<code>mysqlnd_result_get_methods()</code> or object method function table manipulation
Resultset Meta (MYSQLND_RES_METADATA)	MINIT	No	<code>mysqlnd_result_metadata_get_methods()</code>
Statement (MYSQLND_STMT)	MINIT	No	<code>mysqlnd_stmt_get_methods()</code>
Network (MYSQLND_NET)	MINIT or later	Yes	<code>mysqlnd_net_get_methods()</code> or object method function table manipulation
Wire protocol	MINIT or later	Yes	<code>mysqlnd_protocol_get_method</code>

(MYSQLND_PROTOCOL)			s() or object method function table manipulation
--------------------	--	--	--

You must not manipulate function tables at any time later than MINIT if it is not allowed according to the above table.

Some classes contain a pointer to the method function table. All instances of such a class will share the same function table. To avoid chaos, in particular in threaded environments, such function tables must only be manipulated during MINIT.

Other classes use copies of a globally shared function table. The class function table copy is created together with the object. Each object uses its own function table. This gives you two options: you can manipulate the default function table of an object at MINIT, and you can additionally refine methods of an object without impacting other instances of the same class.

The advantage of the shared function table approach is performance. There is no need to copy a function table for each and every object.

Constructors

	Allocation, construction, reset	Can be modified?	Caller
Connection (MYSQLND)	mysqlnd_init()	No	mysqlnd_connect()
Resultset(MYSQLND_RES)	Allocation: <ul style="list-style-type: none"> • Connection::result_init() Reset and re-initialized during: <ul style="list-style-type: none"> • Result::use_result() • Result::store_result 	Yes, but call parent!	<ul style="list-style-type: none"> • Connection::list_fields() • Statement::get_result() • Statement::prepare() (Metadata only) • Statement::resultMetaData()
Resultset Meta (MYSQLND_RES_METADATA)	Connection::result_meta_init()	Yes, but call parent!	Result::read_result_metadata()
Statement (MYSQLND_STMT)	Connection::stmt_init()	Yes, but call parent!	Connection::stmt_init()
Network (MYSQLND_NET)	mysqlnd_net_init()	No	Connection::init()
Wire protocol (MYSQLND_PROTOCOL)	mysqlnd_protocol_init()	No	Connection::init()

It is strongly recommended that you do not entirely replace a constructor. The constructors perform memory allocations. The memory allocations are vital for the `mysqlnd` plugin API and the object logic of `mysqlnd`. If you do not care about warnings and insist on hooking the constructors, you should at least call the parent constructor before doing anything in your constructor.

Regardless of all warnings, it can be useful to subclass constructors. Constructors are the perfect place for modifying the function tables of objects with non-shared object tables, such as Resultset, Network, Wire Protocol.

Destruction

	Derived method must call parent?	Destructor
Connection	yes, after method execution	free_contents(), end_psessions()
Resultset	yes, after method execution	free_result()
Resultset Meta	yes, after method execution	free()
Statement	yes, after method execution	dtor(), free_stmt_content()
Network	yes, after method execution	free()
Wire protocol	yes, after method execution	free()

The destructors are the appropriate place to free properties, `mysqlnd_plugin_get_plugin_<object>_data()`.

The listed destructors may not be equivalent to the actual `mysqlnd` method freeing the object itself. However, they are the best

possible place for you to hook in and free your plugin data. As with constructors you may replace the methods entirely but this is not recommended. If multiple methods are listed in the above table you will need to hook all of the listed methods and free your plugin data in whichever method is called first by `mysqlnd`.

The recommended method for plugins is to simply hook the methods, free your memory and call the parent implementation immediately following this.

Caution

Due to a bug in PHP versions 5.3.0 to 5.3.3, plugins do not associate plugin data with a persistent connection. This is because `ext/mysql` and `ext/mysqli` do not trigger all the necessary `mysqlnd_end_psessions()` method calls and the plugin may therefore leak memory. This has been fixed in PHP 5.3.4.

22.10.3.7.4. The mysqlnd plugin API

[Copyright 1997-2010 the PHP Documentation Group.](#)

The following is a list of functions provided in the `mysqlnd` plugin API:

- `mysqlnd_plugin_register()`
- `mysqlnd_plugin_count()`
- `mysqlnd_plugin_get_plugin_connection_data()`
- `mysqlnd_plugin_get_plugin_result_data()`
- `mysqlnd_plugin_get_plugin_stmt_data()`
- `mysqlnd_plugin_get_plugin_net_data()`
- `mysqlnd_plugin_get_plugin_protocol_data()`
- `mysqlnd_conn_get_methods()`
- `mysqlnd_result_get_methods()`
- `mysqlnd_result_meta_get_methods()`
- `mysqlnd_stmt_get_methods()`
- `mysqlnd_net_get_methods()`
- `mysqlnd_protocol_get_methods()`

There is no formal definition of what a plugin is and how a plugin mechanism works.

Components often found in plugins mechanisms are:

- A plugin manager
- A plugin API
- Application services (or modules)
- Application service APIs (or module APIs)

The `mysqlnd` plugin concept employs these features, and additionally enjoys an open architecture.

No Restrictions

A plugin has full access to the inner workings of `mysqlnd`. There are no security limits or restrictions. Everything can be overwritten to implement friendly or hostile algorithms. It is recommended you only deploy plugins from a trusted source.

As discussed previously, plugins can use pointers freely. These pointers are not restricted in any way, and can point into another plugin's data. Simple offset arithmetic can be used to read another plugin's data.

It is recommended that you write cooperative plugins, and that you always call the parent method. The plugins should always co-operate with `mysqlnd` itself.

Issues: an example of chaining and cooperation

Extension	mysqlnd.query() pointer	call stack if calling parent
ext/mysqlnd	mysqlnd.query()	mysqlnd.query
ext/mysqlnd_cache	mysqlnd_cache.query()	1. mysqlnd_cache.query() 2. mysqlnd.query
ext/mysqlnd_monitor	mysqlnd_monitor.query()	1. mysqlnd_monitor.query() 2. mysqlnd_cache.query() 3. mysqlnd.query

In this scenario, a cache (`ext/mysqlnd_cache`) and a monitor (`ext/mysqlnd_monitor`) plugin are loaded. Both subclass `Connection::query()`. Plugin registration happens at `MINIT` using the logic shown previously. PHP calls extensions in alphabetical order by default. Plugins are not aware of each other and do not set extension dependencies.

By default the plugins call the parent implementation of the query method in their derived version of the method.

PHP Extension Recap

This is a recap of what happens when using an example plugin, `ext/mysqlnd_plugin`, which exposes the `mysqlnd` C plugin API to PHP:

- Any PHP MySQL application tries to establish a connection to 192.168.2.29
- The PHP application will either use `ext/mysql`, `ext/mysqli` or `PDO_MYSQL`. All three PHP MySQL extensions use `mysqlnd` to establish the connection to 192.168.2.29.
- `mysqlnd` calls its connect method, which has been subclassed by `ext/mysqlnd_plugin`.
- `ext/mysqlnd_plugin` calls the userspace hook `proxy::connect()` registered by the user.
- The userspace hook changes the connection host IP from 192.168.2.29 to 127.0.0.1 and returns the connection established by `parent::connect()`.
- `ext/mysqlnd_plugin` performs the equivalent of `parent::connect(127.0.0.1)` by calling the original `mysqlnd` method for establishing a connection.
- `mysqlnd` establishes a connection and returns to `ext/mysqlnd_plugin`. `ext/mysqlnd_plugin` returns as well.
- Whatever PHP MySQL extension had been used by the application, it receives a connection to 127.0.0.1. The PHP MySQL extension itself returns to the PHP application. The circle is closed.

22.10.3.7.5. Getting started building a mysqlnd plugin

[Copyright 1997-2010 the PHP Documentation Group.](#)

It is important to remember that a `mysqlnd` plugin is itself a PHP extension.

The following code shows the basic structure of the `MINIT` function that will be used in the typical `mysqlnd` plugin:

```
/* my_php_mysqlnd_plugin.c */

static PHP_MINIT_FUNCTION(mysqlnd_plugin) {
    /* globals, ini entries, resources, classes */

    /* register mysqlnd plugin */
    mysqlnd_plugin_id = mysqlnd_plugin_register();

    conn_m = mysqlnd_get_conn_methods();
    memcpy(org_conn_m, conn_m,
           sizeof(struct st_mysqlnd_conn_methods));
}
```

```

    conn_m->query = MYSQLND_METHOD(mysqlnd_plugin_conn, query);
    conn_m->connect = MYSQLND_METHOD(mysqlnd_plugin_conn, connect);
}

```

```

/* my_mysqlnd_plugin.c */
enum_func_status MYSQLND_METHOD(mysqlnd_plugin_conn, query)(/* ... */) {
    /* ... */
}
enum_func_status MYSQLND_METHOD(mysqlnd_plugin_conn, connect)(/* ... */) {
    /* ... */
}

```

Task analysis: from C to userspace

```

class proxy extends mysqlnd_plugin_connection {
    public function connect($host, ...) { .. }
}
mysqlnd_plugin_set_conn_proxy(new proxy());

```

Process:

1. PHP: user registers plugin callback
2. PHP: user calls any PHP MySQL API to connect to MySQL
3. C: ext/*mysql* calls mysqlnd method
4. C: mysqlnd ends up in ext/mysqlnd_plugin
5. C: ext/mysqlnd_plugin
 - a. Calls userspace callback
 - b. Or orginal `mysqlnd` method, if userspace callback not set

You need to carry out the following:

1. Write a class "mysqlnd_plugin_connection" in C
2. Accept and register proxy object through "mysqlnd_plugin_set_conn_proxy()"
3. Call userspace proxy methods from C (optimization - zend_interfaces.h)

Userspace object methods can either be called using `call_user_function()` or you can operate at a level closer to the Zend Engine and use `zend_call_method()`.

Optimization: calling methods from C using zend_call_method

The following code snippet shows the prototype for the `zend_call_method` function, taken from `zend_interfaces.h`.

```

ZEND_API zval* zend_call_method(
    zval **object_pp, zend_class_entry *obj_ce,
    zend_function **fn_proxy, char *function_name,
    int function_name_len, zval **retval_ptr_ptr,
    int param_count, zval* arg1, zval* arg2 TSRMLS_DC
);

```

Zend API supports only two arguments. You may need more, for example:

```

enum_func_status (*func_mysqlnd_conn_connect)(
    MYSQLND *conn, const char *host,
    const char * user, const char * passwd,
    unsigned int passwd_len, const char * db,
    unsigned int db_len, unsigned int port,
    const char * socket, unsigned int mysql_flags TSRMLS_DC
)

```

```
);
```

To get around this problem you will need to make a copy of `zend_call_method()` and add a facility for additional parameters. You can do this by creating a set of `MY ZEND CALL METHOD WRAPPER` macros.

Calling PHP userspace

This code snippet shows the optimized method for calling a userspace function from C:

```
/* my_mysqlnd_plugin.c */

MYSQLND_METHOD(my_conn_class,connect)(
    MYSQLND *conn, const char *host /* ... */ TSRMLS_DC) {
    enum_func_status ret = FAIL;
    zval * global_user_conn_proxy = fetch_userspace_proxy();
    if (global_user_conn_proxy) {
        /* call userspace proxy */
        ret = MY_ZEND_CALL_METHOD_WRAPPER(global_user_conn_proxy, host, /*...*/);
    } else {
        /* or original mysqlnd method = do nothing, be transparent */
        ret = org_methods.connect(conn, host, user, passwd,
                                  passwd_len, db, db_len, port,
                                  socket, mysql_flags TSRMLS_CC);
    }
    return ret;
}
```

Calling userspace: simple arguments

```
/* my_mysqlnd_plugin.c */

MYSQLND_METHOD(my_conn_class,connect)(
    /* ... */, const char *host, /* ... */) {
/* ... */
if (global_user_conn_proxy) {
    /* ... */
    zval* zv_host;
    MAKE_STD_ZVAL(zv_host);
    ZVAL_STRING(zv_host, host, 1);
    MY_ZEND_CALL_METHOD_WRAPPER(global_user_conn_proxy, zv_retval, zv_host /*, ...*/);
    zval_ptr_dtor(&zv_host);
    /* ... */
}
/* ... */
}
```

Calling userspace: structs as arguments

```
/* my_mysqlnd_plugin.c */

MYSQLND_METHOD(my_conn_class, connect)(
    MYSQLND *conn, /* ... */ {
/* ... */
if (global_user_conn_proxy) {
    /* ... */
    zval* zv_conn;
    ZEND_REGISTER_RESOURCE(zv_conn, (void *)conn, le_mysqlnd_plugin_conn);
    MY_ZEND_CALL_METHOD_WRAPPER(global_user_conn_proxy, zv_retval, zv_conn, zv_host /*, ...*/);
    zval_ptr_dtor(&zv_conn);
    /* ... */
}
/* ... */
}
```

The first argument of many `mysqlnd` methods is a C "object". For example, the first argument of the `connect()` method is a pointer to `MYSQLND`. The struct `MYSQLND` represents a `mysqlnd` connection object.

The `mysqlnd` connection object pointer can be compared to a standard I/O file handle. Like a standard I/O file handle a `mysqlnd` connection object shall be linked to the userspace using the PHP resource variable type.

From C to userspace and back

```
class proxy extends mysqlnd_plugin_connection {
    public function connect($conn, $host, ...) {
        /* "pre" hook */
        printf("Connecting to host = '%s'\n", $host);
        debug_print_backtrace();
```

```

        return parent::connect($conn);
    }

    public function query($conn, $query) {
        /* "post" hook */
        $ret = parent::query($conn, $query);
        printf("Query = '%s'\n", $query);
        return $ret;
    }
}

mysqlnd_plugin_set_conn_proxy(new proxy());

```

PHP users must be able to call the parent implementation of an overwritten method.

As a result of subclassing it is possible to refine only selected methods and you can choose to have "pre" or "post" hooks.

Buildin class: mysqlnd_plugin_connection::connect()

```

/* my_mysqlnd_plugin_classes.c */

PHP_METHOD("mysqlnd_plugin_connection", connect) {
    /* ... simplified! ... */
    zval* mysqlnd_rsrc;
    MYSQLND* conn;
    char* host; int host_len;
    if (zend_parse_parameters(ZEND_NUM_ARGS() TSRMLS_CC, "rs",
        &mysqlnd_rsrc, &host, &host_len) == FAILURE) {
        RETURN_NULL();
    }
    ZEND_FETCH_RESOURCE(conn, MYSQLND* conn, &mysqlnd_rsrc, -1,
        "Mysqlnd Connection", le_mysqlnd_plugin_conn);
    if (PASS == org_methods.connect(conn, host, /* simplified! */ TSRMLS_CC))
        RETVAL_TRUE;
    else
        RETVAL_FALSE;
}

```

22.10.4. MySQL Functions (PDO_MYSQL)

Copyright 1997-2010 the PHP Documentation Group.

PDO_MYSQL is a driver that implements the [PHP Data Objects \(PDO\) interface](#) to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

Warning

Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using driver-specific attributes with another driver may result in unexpected behaviour. [PDO::getAttribute](#) may be used to obtain the [PDO_ATTR_DRIVER_NAME](#) attribute to check the driver, if your code can run against multiple drivers.

PDO::MYSQL_ATTR_USE_BUFFERED_QUERY (integer) If this attribute is set to [TRUE](#) on a [PDOStatement](#), the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use [PDOStatement::fetchAll](#) instead.

Example 22.154. Forcing queries to be buffered in mysql

```

<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
    $stmt = $db->prepare('select * from foo',
        array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
    die("my application only works with mysql; I should use \$stmt->fetchAll() instead");
?>

```

<code>PDO::MYSQL_ATTR_LOCAL_INFILE</code> (integer)	Enable <code>LOAD LOCAL INFILE</code> . Note, this constant can only be used in the <code>driver_options</code> array when constructing a new database handle.
<code>PDO::MYSQL_ATTR_INIT_COMMAND</code> (integer)	Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting. Note, this constant can only be used in the <code>driver_options</code> array when constructing a new database handle.
<code>PDO::MYSQL_ATTR_READ_DEFAULT_FILE</code> (integer)	Read options from the named option file instead of from <code>my.cnf</code> . This option is not available if mysqlnd is used, because mysqlnd does not read the mysql configuration files.
<code>PDO::MYSQL_ATTR_READ_DEFAULT_GROUP</code> (integer)	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQL_READ_DEFAULT_FILE</code> . This option is not available if mysqlnd is used, because mysqlnd does not read the mysql configuration files.
<code>PDO::MYSQL_ATTR_MAX_BUFFER_SIZE</code> (integer)	Maximum buffer size. Defaults to 1 MiB. This constant is not supported when compiled against mysqlnd.
<code>PDO::MYSQL_ATTR_DIRECT_QUERY</code> (integer)	Perform direct queries, don't use prepared statements.
<code>PDO::MYSQL_ATTR_FOUND_ROWS</code> (integer)	Return the number of found (matched) rows, not the number of changed rows.
<code>PDO::MYSQL_ATTR_IGNORE_SPACE</code> (integer)	Permit spaces after function names. Makes all functions names reserved words.
<code>PDO::MYSQL_ATTR_COMPRESS</code> (integer)	Enable network communication compression. This is not supported when compiled against mysqlnd.

The behaviour of these functions is affected by settings in `php.ini`.

Table 22.20. PDO_MYSQL Configuration Options

Name	Default	Changeable
<code>pdo_mysql.default_socket</code>	<code>"/tmp/mysql.sock"</code>	<code>PHP_INI_SYSTEM</code>
<code>pdo_mysql.debug</code>	<code>NULL</code>	<code>PHP_INI_SYSTEM</code>

For further details and definitions of the `PHP_INI_*` modes, see the [configuration.changes.modes](#).

Here's a short explanation of the configuration directives.

<code>pdo_mysql.default_socket</code> string	Sets a Unix domain socket. This value can either be set at compile time if a domain socket is found at configure. This ini setting is Unix only.
<code>pdo_mysql.debug</code> boolean	Enables debugging for PDO_MYSQL. This setting is only available when PDO_MYSQL is compiled against mysqlnd and in PDO debug mode.

22.10.4.1. PDO_MYSQL DSN

Copyright 1997-2010 the PHP Documentation Group.

- [PDO_MYSQL DSN](#)
- Connecting to MySQL databases

Description

The PDO_MYSQL Data Source Name (DSN) is composed of the following elements:

DSN prefix	The DSN prefix is <code>mysql:</code> .
<code>host</code>	The hostname on which the database server resides.
<code>port</code>	The port number where the database server is listening.
<code>dbname</code>	The name of the database.
<code>unix_socket</code>	The MySQL Unix socket (shouldn't be used with <code>host</code> or <code>port</code>).
<code>charset</code>	Currently ignored.

Examples

Example 22.155. PDO_MYSQL DSN examples

The following example shows a PDO_MYSQL DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb  
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

Notes

Unix only:

When the host name is set to "`localhost`", then the connection to the server is made thru a domain socket. If PDO_MYSQL is compiled against libmysql then the location of the socket file is at libmysql's compiled in location. If PDO_MYSQL is compiled against mysqlnd a default socket can be set thru the `pdo_mysql.default_socket` setting.

22.10.5. Connector/PHP

The MySQL Connector/PHP is a version of the `mysql` and `mysqli` extensions for PHP optimized for the Windows operating system. Later versions of the main PHP `mysql`/`mysqli` drivers are compatible with Windows and a separate, Windows specific driver is no longer required.

For PHP for all platforms, including Windows, you should use the `mysql` or `mysqli` extensions shipped with the PHP sources. See [Section 22.10, “MySQL PHP API”](#).

22.10.6. Common Problems with MySQL and PHP

- **Error: Maximum Execution Time Exceeded:** This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- **Fatal error: Call to unsupported or undefined function mysql_connect() in ...:** This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- **Error: Undefined reference to 'uncompress':** This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lzip` last when linking with `-lmysqlclient`.
- **Error: Client does not support authentication protocol:** This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See [Section C.5.2.4](#),

`Client does not support authentication protocol`, for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: <http://www.coggeshall.org/oss/mysql2i>.

22.10.7. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxm12 -lz -lm -lxm12 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm  
-lxm12 -lz -lm -lcrypt -lxm12 -lz -lm -lcrypt
```

Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxm12
```

3. Build and install PHP:

```
make  
make install
```

22.11. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a `DBI` script that works with many different database engines without change. To use `DBI`, you must install the `DBI` module, as well as a DataBase Driver (`DBD`) module for each type of server you want to access. For MySQL, this driver is the `DBD::mysql` module.

Perl `DBI` is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl `DBI` support are given in [Section 2.13, “Perl Installation Notes”](#).

`DBI` information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI  
shell> perldoc DBI::FAQ  
shell> perldoc DBD::mysql
```

You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl `DBI`, visit the `DBI` Web site, <http://dbi.perl.org/>. That site hosts a general `DBI` mailing list. Oracle Corporation hosts a list specifically about `DBD::mysql`; see [Section 1.6.1, “MySQL Mailing Lists”](#).
- For printed information, the official `DBI` book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the `DBI` Web site, <http://dbi.perl.org/>.

For information that focuses specifically on using `DBI` with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is <http://www.kitebird.com/mysql-perl/>.

22.12. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

22.13. MySQL Ruby APIs

Two APIs available for Ruby programmers. The MySQL/Ruby API is based on the `libmysql` API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver).

For more information on Ruby, see [Ruby Programming Language](#).

For information on installing and using the MySQL/Ruby API, see [Section 22.13.1, “The MySQL/Ruby API”](#).

For information on installing and using the Ruby/MySQL API, see [Section 22.13.2, “The Ruby/MySQL API”](#).

22.13.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysql`.

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

22.13.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

22.14. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at <http://www.xdobry.de/mysqltcl/>.

22.15. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

Chapter 23. Extending MySQL

23.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in [Section 2.9.3, “Installing MySQL from a Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our [internals](#) mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.6.1, “MySQL Mailing Lists”](#). Many MySQL developers at Oracle Corporation are on the [internals](#) list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

23.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see [Section 7.11.5.1, “How MySQL Uses Threads for Client Connections”](#).

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be additional read and write threads by default. The number of these are controlled by the `innodb_read_io_threads` and `innodb_write_io_threads` parameters. See [Section 13.6.4, “InnoDB Startup Options and System Variables”](#).
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See [Section 12.2.5.2, “`INSERT DELAYED` Syntax”](#).
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See [Section 19.4.1, “Event Scheduler Overview”](#).

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, replication, and event threads.

23.1.2. The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at <http://dev.mysql.com/doc/>.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.7, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See [Section 1.6.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

23.2. The MySQL Plugin API

MySQL supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, storage engines, full-text parser plugins, partitioning support, and server extensions.

For example, full-text parser plugins can be used to replace or augment the built-in full-text parser. A plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is intended as the successor to the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins that have been installed permanently with the `INSTALL PLUGIN` statement. This table is created as part of the MySQL installation process. Plugins can also be installed for a single server invocation with the `--plugin-load` option. Plugins installed this way are not recorded in the `plugin` table. See [Section 12.4.3.1, “Installing and Uninstalling Plugins”](#).

MySQL 5.5.7 and up supports an API for client plugins in addition to that for server plugins. This is used, for example, by authentication plugins where a server-side plugin and a client-side plugin cooperate to enable clients to connect to the server through a variety of authentication methods.

23.2.1. Plugin API Characteristics

The server plugin API has these characteristics:

- All plugins have several things in common.

Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the `INFORMATION_SCHEMA.PLUGINS` table or using the `SHOW PLUGINS` statement.

- The plugin framework is extendable to accommodate different kinds of plugins.

Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Interfaces for several types of plugins exist, such as storage engines, full-text parser, and `INFORMATION_SCHEMA` tables. Others can be added.

- Plugins can expose information to users.

A plugin can implement system and status variables that are available through the `SHOW VARIABLES` and `SHOW STATUS` statements.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parsing plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

- Plugins have access to server services.

The services interface exposes server functionality that plugins can access using ordinary function calls. For details, see [Section 23.2.6, “MySQL Services for Plugins”](#).

In some respects, the server plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

The client plugin API has similar architectural characteristics, but client plugins do not have direct access to the server the way server plugins do.

23.2.2. Plugin API Components

The server plugin implementation comprises several components.

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `mysql.plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The `WITH PARSE` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about server plugins.

Command-line options and system variables:

- The `--plugin-load` option enables plugins to be loaded at server startup time.
- The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=path` option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see [Section 12.4.3.1, “Installing and Uninstalling Plugins”](#).

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.

- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process.

The client plugin implementation is simpler:

- For the `mysql_options()` C API function, `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options that enable client programs to load authentication plugins.
- C API functions that enable management of client plugins.

To examine how MySQL implements plugins, consult the following source files in a MySQL source distribution:

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_xxx.h` files provide additional information that pertains to specific types of plugins. `client_plugin.h` contains information specific to client plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. `sql_acl.cc` is where the server uses authentication plugins. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.
- In the `sql-common` directory, `client_plugin.h` implements the C API client plugin functions, and `client.c` implements client authentication support. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

23.2.3. Types of Plugins

The plugin API enables creation of several types of plugins. This section provides an overview of them.

23.2.3.1. Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see [Section 13.4, “Overview of MySQL Storage Engine Architecture”](#).

For information on how to use the plugin API to write storage engines, see [MySQL Internals: Custom Engine](#).

23.2.3.2. Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). For full-text processing, “parsing” means extracting words from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 11.9, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables such as `ft_min_word_len` and `ft_max_word_len` that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored.

The plugin API enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for word accumulation).

One reason to use a parser this way is that you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. In particular, this parsing will be affected by the `ft_xxx` system variables and the stopword list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from nonplaintext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
(
    doc CHAR(255),
    FULLTEXT INDEX (doc) WITH PARSER my_parser
) ENGINE=MyISAM;
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSER my_parser;
```

The only SQL change for associating the parser with the index is the `WITH PARSER` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use it a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see [Section 23.2.4.3.1, “Full-Text Parser Plugin Data Structures and Functions”](#).

23.2.3.3. INFORMATION_SCHEMA Plugins

`INFORMATION_SCHEMA` plugins enable the creation of tables containing server metadata that are exposed to users through the `INFORMATION_SCHEMA` database. For example, `InnoDB` uses `INFORMATION_SCHEMA` plugins to provide tables that contain information about current transactions and locks.

23.2.3.4. Semisynchronous Replication Plugins

MySQL replication is asynchronous by default. With semisynchronous replication, a commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through complementary master and client plugins. See [Section 17.3.8, “Semisynchronous Replication”](#).

23.2.3.5. Audit Plugins

As of MySQL 5.5.3, the server provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Currently, audit notification occurs for these operations (although the interface is general and the server could be modified to report others):

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match.

This interface enables audit plugins to receive notifications only about operations in event classes they consider significant and to ignore others. The interface provides for categorization of operations into event classes and further division into event subclasses within each class.

When an audit plugin is notified of an auditable event, it receives a pointer to the current THD structure and a pointer to a structure that contains information about the event. The plugin can examine the event and perform whatever auditing actions are appropriate.

For example, the plugin can see what statement produced a result set or was logged, the number of rows in a result, who the current user was for an operation, or the error code for failed operations.

For more information about audit plugins, see [Section 23.2.5.2, “Writing Audit Plugins”](#).

23.2.3.6. Authentication Plugins

MySQL 5.5.7 and up supports pluggable authentication. Authentication plugins have a server side and a client side. Plugins on the server side implement authentication methods for use by clients when they connect to the server. Plugins on the client side communicate with the corresponding server-side plugin. A client-side plugin may interact with users, performing tasks such as soliciting a password or other authentication credentials to be sent to the server. See [Section 5.5.6, “Pluggable Authentication”](#).

Pluggable authentication also enables proxy user capability, in which one user takes the identity of another user. A server-side authentication plugin can return to the server the name of the user whose identity the connecting user should have. See [Section 5.5.7, “Proxy Users”](#).

23.2.4. Plugin Data Structures and Functions

Every server plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin. The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the given type needs to do. The server plugin interface also enables plugins to expose status and system variables. These variables become invisible through the `SHOW STATUS` and `SHOW VARIABLES` statements and through the corresponding `INFORMATION_SCHEMA` tables.

On the client side, the architecture is a bit different. Each plugin must have a descriptor, but there is no division into separate general and type-specific descriptors. Instead, the descriptor for all client plugin types begins with a common set of members, which are followed by any additional members required to implement specific plugin types.

23.2.4.1. General Plugin Data Structures and Functions

Every server plugin must have a general descriptor that provides information to the plugin API. The general descriptor has the same structure for all plugin types. The `st_mysql_plugin` structure in the `plugin.h` file defines this descriptor:

```
struct st_mysql_plugin
{
    int type;           /* the plugin type (a MYSQL_XXX_PLUGIN value) */
    void *info;         /* pointer to type-specific plugin descriptor */
    const char *name;   /* plugin name */
    const char *author; /* plugin author (for SHOW PLUGINS) */
    const char *descr;  /* general descriptive text (for SHOW PLUGINS ) */
    int license;        /* the plugin license (PLUGIN_LICENSE_XXX) */
    int (*init)(void *); /* the function to invoke when plugin is loaded */
    int (*deinit)(void *); /* the function to invoke when plugin is unloaded */
    unsigned int version; /* plugin version (for SHOW PLUGINS) */
    struct st_mysql_show_var *status_vars;
    struct st_mysql_sys_var **system_vars;
    void * __reserved1; /* reserved for dependency checking */
};
```

The `st_mysql_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`

The plugin type. This must be one of the plugin-type values from `plugin.h`:

```
/*
 * The allowable types of plugins
 */
#define MYSQL_UDF_PLUGIN      0 /* User-defined function */
#define MYSQL_STORAGE_ENGINE_PLUGIN 1 /* Storage Engine */
#define MYSQL_FTPARSER_PLUGIN 2 /* Full-text parser plugin */
#define MYSQL_DAEMON_PLUGIN 3 /* The daemon/raw plugin type */
#define MYSQL_INFORMATION_SCHEMA_PLUGIN 4 /* The I_S plugin type */
#define MYSQL_AUDIT_PLUGIN 5 /* The Audit plugin type */
#define MYSQL_REPLICATION_PLUGIN 6 /* The replication plugin type */
#define MYSQL_AUTHENTICATION_PLUGIN 7 /* The authentication plugin type */
...
```

For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- `info`

A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. Each type-specific descriptor has a version number that indicates the API version for that type of plugin, plus any other members needed. See [Section 23.2.4.3, “Type-Specific Plugin Data Structures and Functions”](#).

- **`name`**

A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

- **`author`**

A string naming the plugin author. This can be whatever you like.

- **`desc`**

A string that provides a general description of the plugin. This can be whatever you like.

- **`license`**

The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.

- **`init`**

A once-only initialization function, or `NULL` if there is no such function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.

- **`deinit`**

A once-only deinitialization function, or `NULL` if there is no such function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server shutdown. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.

- **`version`**

The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.

- **`status_vars`**

A pointer to a structure for status variables associated with the plugin, or `NULL` if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

The `status_vars` member, if not `NULL`, points to an array of `st_mysql_show_var` structures that describe status variables. See [Section 23.2.4.2, “Plugin Status and System Variables”](#).

- **`system_vars`**

A pointer to a structure for system variables associated with the plugin, or `NULL` if there are no such variables. These options and system variables can be used to help initialize variables within the plugin.

The `system_vars` member, if not `NULL`, points to an array of `st_mysql_sys_var` structures that describe system variables. See [Section 23.2.4.2, “Plugin Status and System Variables”](#).

- **`__reserved1`**

A placeholder for the future. Currently, it should be set to `NULL`.

The server invokes the `init` and `deinit` functions in the general plugin descriptor only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

23.2.4.2. Plugin Status and System Variables

The server plugin interface enables plugins to expose status and system variables using the `status_vars` and `system_vars` members of the general plugin descriptor.

The `status_vars` member of the general plugin descriptor, if not 0, points to an array of `st_mysql_show_var` structures, each of which describes one status variable, followed by a structure with all members set to 0. The `st_mysql_show_var` structure has this definition:

```
struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`.

The following table shows the permissible status variable `type` values and what the corresponding variable should be.

Table 23.1. Plugin Status Variable Types

Variable Type	Meaning
<code>SHOW_BOOL</code>	Pointer to a boolean variable
<code>SHOW_INT</code>	Pointer to an integer variable
<code>SHOW_LONG</code>	Pointer to a long integer variable
<code>SHOW_LONGLONG</code>	Pointer to a longlong integer variable
<code>SHOW_CHAR</code>	A string
<code>SHOW_CHAR_PTR</code>	Pointer to a string
<code>SHOW_ARRAY</code>	Pointer to another <code>st_mysql_show_var</code> array
<code>SHOW_FUNC</code>	Pointer to a function
<code>SHOW_DOUBLE</code>	Pointer to a double

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024
typedef int (*mysql_show_var_func) (void *thd,
                                    struct st_mysql_show_var *out,
                                    char *buf);
```

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The `st_mysql_sys_var` structure is defined as follows:

```
struct st_mysql_sys_var {
    int flags;
    const char *name, *comment;
    int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
    void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- `name`: An unquoted identifier for the system variable.
- `varname`: The identifier for the static variable. Where not available, it is the same as the `name` field.
- `opt`: Additional use flags for the system variable. The following table shows the permissible flags.

Table 23.2. Plugin System Variable Flags

Flag Value	Description
PLUGIN_VAR_READONLY	The system variable is read only
PLUGIN_VAR_NOSYSGVAR	The system variable is not user visible at runtime
PLUGIN_VAR_NOCMDOPT	The system variable is not configurable from the command line
PLUGIN_VAR_NOCMDARG	No argument is required at the command line (typically used for boolean variables)
PLUGIN_VAR_RQCMDARG	An argument is required at the command line (this is the default)
PLUGIN_VAR_OPCMDARG	An argument is optional at the command line
PLUGIN_VAR_MEMALLOC	Used for string variables; indicates that memory is to be allocated for storage of the string

- **comment**: A descriptive comment to be displayed in the server help message. `NULL` if this variable is to be hidden.
- **check**: The check function, `NULL` for default.
- **update**: The update function, `NULL` for default.
- **default**: The variable default value.
- **minimum**: The variable minimum value.
- **maximum**: The variable maximum value.
- **blocksize**: The variable block size. When the value is set, it is rounded to the nearest multiple of `blocksize`.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()` accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
    PLUGIN_VAR_RQCMDARG, "foo comment",
    NULL, NULL, 0, 0, INT_MAX, 0);
...
SYSVAR(foo_var)= value;
value= SYSVAR(foo_var);
my_foo= value;
value= my_foo;
```

Session variables may be accessed only through the `THDVAR()` accessor macro. For example:

```
static MYSQL_THDVAR_BOOL(some_flag,
    PLUGIN_VAR_NOCMDARG, "flag comment",
    NULL, NULL, FALSE);
...
if (THDVAR(thd, some_flag))
{
    do_something();
    THDVAR(thd, some_flag)= FALSE;
}
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a `NULL`-terminated array of the variables and linking to it in the plugin public interface. For example:

```
static struct st_mysql_sys_var *my_plugin_vars[] = {
    MYSQL_SYSVAR(my_foo),
    MYSQL_SYSVAR(some_flag),
    NULL
};
mysql_declare_plugin(fooplug)
{
    MYSQL_PLUGIN,
    &plugin_data,
    "fooplug",
    "foo author",
    "This does foo!",
    PLUGIN_LICENSE_GPL,
    foo_init,
    foo_fini,
    0x0001,
    NULL,
    my_plugin_vars,
    NULL
}
mysql_declare_plugin_end;
```

The following convenience macros enable you to declare different types of system variables:

- Boolean system variables of type `my_bool`, which is a 1-byte boolean. (0 = FALSE, 1 = TRUE)

```
MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)
```

- String system variables of type `char*`, which is a pointer to a null-terminated string.

```
MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)
```

- Integer system variables, of which there are several varieties.

- An `int` system variable, which is typically a 4-byte signed word.

```
MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)
```

- An `unsigned int` system variable, which is typically a 4-byte unsigned word.

```
MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
                  minimum, maximum, blocksize)
```

- A `long` system variable, which is typically either a 4- or 8-byte signed word.

```
MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
                  minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

```
MYSQL_THDVAR ULONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR ULONG(name, varname, opt, comment, check, update, default,
                   minimum, maximum, blocksize)
```

- A `long long` system variable, which is typically an 8-byte signed word.

```
MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
                      default, minimum, maximum, blocksize)
MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
                      default, minimum, maximum, blocksize)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

```
MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update,
                       default, minimum, maximum, blocksize)
MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update,
                       default, minimum, maximum, blocksize)
```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the `typelib`, starting from 0.

```
MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update,
                  default, typelib)
```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the `typelib`.

```
MYSQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_SET(name, varname, opt, comment, check, update,
                 default, typelib)
```

Internally, all mutable and plugin system variables are stored in a `HASH`.

Display of the server command-line help text is handled by compiling a `DYNAMIC_ARRAY` of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the `argv` by the `handle_option()` function (`my_getopt.c`); in effect, it is consumed.

The processing of command-line options is performed during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called.

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at `mysqld` initialization time and configuration options can be set at the command line or within `my.cnf`.

Plugins should consider the `thd` parameter to be read only.

23.2.4.3. Type-Specific Plugin Data Structures and Functions

Each type of server plugin has its own type-specific structures and functions. The primary structure is the type-specific plugin descriptor. This is pointed to by the `info` member of the `st_mysql_plugin` general plugin descriptor, but has a structure determined by the requirements of the plugin type.

For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. The type-specific descriptor commonly includes callback functions and other information needed by the server to invoke the plugin properly.

23.2.4.3.1. Full-Text Parser Plugin Data Structures and Functions

The following discussion describes the full-text parser type-specific plugin descriptor.

For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions. The version is specified using a symbol of the form `MYSQL_xxx_INTERFACE_VERSION` (such as `MYSQL_FTPARSER_INTERFACE_VERSION` for full-text parser plugins). The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no `FULLTEXT` index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has `init` and `deinit` members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a `MYSQL_FTPARSER_PARAM` structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
```

```
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                      char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                          char *word, int word_len,
                          MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- **`mysql_parse`**

A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the `mysql_parse` callback.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- **`mysql_add_word`**

A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- **`ftparser_state`**

This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.

- **`mysql_ftparam`**

This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.

- **`cs`**

A pointer to information about the character set of the text, or 0 if no information is available.

- **`doc`**

A pointer to the text to be parsed.

- **`length`**

The length of the text to be parsed, in bytes.

- **`flags`**

Parser flags. This is zero if there are no special flags. Currently, the only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- **`mode`**

The parsing mode. This value will be one of the following constants:

- [MYSQL_FTPARSER_SIMPLE_MODE](#)

Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.

- [MYSQL_FTPARSER_WITH_STOPWORDS](#)

Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.

- [MYSQL_FTPARSER_FULL_BOOLEAN_INFO](#)

Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens using the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a [MYSQL_FTPARSER_BOOLEAN_INFO](#) structure and pass a pointer to it.

If the parser is called in boolean mode, the `param->mode` value will be [MYSQL_FTPARSER_FULL_BOOLEAN_INFO](#). The [MYSQL_FTPARSER_BOOLEAN_INFO](#) structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    bool wasign;
    bool trunc;
    /* These are parser state and must be removed. */
    byte prev;
    byte *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- [type](#)

The token type. The following table shows the permissible types.

Table 23.3. Full-Text Parser Token Types

Token Value	Meaning
<code>FT_TOKEN_EOF</code>	End of data
<code>FT_TOKEN_WORD</code>	A regular word
<code>FT_TOKEN_LEFT_PAREN</code>	The beginning of a group or subexpression
<code>FT_TOKEN_RIGHT_PAREN</code>	The end of a group or subexpression
<code>FT_TOKEN_STOPWORD</code>	A stopword

- [yesno](#)

Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.

- [weight_adjust](#)

A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 11.9.2, “Boolean Full-Text Searches”](#), that use the `<` and `>` operators illustrate how weighting works.

- [wasign](#)

The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.

- `trunc`

Whether matching should be done as if the boolean-mode * truncation operator had been given.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

23.2.4.4. Client Plugin API Data Structures

Each client plugin has a declaration that provides the interface to the client library. The structure to declare the plugin begins with a fixed set of members common to all plugin types, followed by members specific to the plugin type.

The `st_mysql_client_plugin` structure is a “generic” descriptor that contains the common members:

```
/* generic plugin header structure */

struct st_mysql_client_plugin
{
    int type;
    unsigned int interface_version;
    const char *name;
    const char *author;
    const char *desc;
    unsigned int version[3];
    const char *license;
    void *mysql_api;
    int (*init)(char *, size_t, int, va_list);
    int (*deinit)();
    int (*options)(const char *option, const void *);
};
```

The common structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `client_plugin.h`, such as `MYSQL_CLIENT_AUTHENTICATION_PLUGIN`.
- `interface_version`: The plugin interface version. For example, this is `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION` for an authentication plugin.
- `name`: A string that gives the plugin name. This is the name by which you refer to the plugin when you call `mysql_options()` with the `MYSQL_DEFAULT_AUTH` option or specify the `--default-auth` option to the `mysql` client.
- `author`: A string naming the plugin author. This can be whatever you like.
- `desc`: A string that provides a general description of the plugin. This can be whatever you like.
- `version`: The plugin version as an array of three integers indicating the major, minor, and teeny versions. For example, `{1,2,3}` indicates version 1.2.3.
- `license`: A string that specifies the license type.
- `mysql_api`: For internal use. Specify it as `NULL` in the plugin descriptor.
- `init`: A once-only initialization function, or `NULL` if there is no such function. The client library executes this function when it loads the plugin. The function returns zero for success and nonzero for failure.

The `init` function uses its first two arguments to return an error message if an error occurs. The first argument is a pointer to a `char` buffer, and the second argument indicates the buffer length. Any message returned by the `init` function must be null-terminated, so the maximum message length is the buffer length minus one. The next arguments are passed to `mysql_load_plugin()`. The first indicates how many more arguments there are (0 if none), followed by any remaining arguments.

- `deinit`: A once-only deinitialization function, or `NULL` if there is no such function. The client library executes this function when it unloads the plugin. The function takes no arguments. It returns zero for success and nonzero for failure.
- `options`: A function for handling options passed to the plugin, or `NULL` if there is no such function. The function takes two arguments representing the option name and a pointer to its value.

The declaration for a specific client plugin type begins with the common members, followed by any additional members necessary to implement plugins of that type. For example, the `st_mysql_client_plugin_AUTHENTICATION` structure for authentication plugins has a function at the end that the client library calls to perform authentication.

To declare a plugin, use the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros:

```
mysql_declare_client_plugin(plugin_type)
  ... common members from name to options ...
  ... type-specific extra members ...
mysql_end_client_plugin;
```

Do not specify the `type` or `interface_version` member explicitly. The `mysql_declare_client_plugin()` macro uses the `plugin_type` argument to generate their values automatically. For example, declare an authentication client plugin like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
  "my_auth_plugin",
  "Author Name",
  "My Client Authentication Plugin",
  {1,0,0},
  "GPL",
  NULL,
  my_auth_init,
  my_auth_init,
  my_auth_options,
  my_auth_main
mysql_end_client_plugin;
```

This declaration uses the `AUTHENTICATION` argument to set the `type` and `interface_version` members to `MYSQL_CLIENT_AUTHENTICATION_PLUGIN` and `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION`.

The main function, `my_auth_main()`, is declared like this:

```
int my_auth_main(MYSQL_PLUGIN_VIO *vio, MYSQL *mysql);
```

The `mysql_declare_plugin()` and `mysql_declare_client_plugin()` macros differ somewhat in how they can be invoked, which has implications for the contents of plugin libraries. The following guidelines summarize the rules:

- `mysql_declare_plugin()` and `mysql_declare_client()` plugin can both be used in the same source file, but each can be used at most once.
- `mysql_declare_plugin()` permits multiple server plugin declarations, so a plugin library can contain multiple server plugins.
- `mysql_declare_client_plugin()` permits only a single client plugin declaration. To create multiple client plugins, separate plugin libraries must be used.

Normally, a client program causes a plugin to be loaded and used by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See [Section 22.9.10, “C API Client Plugin Functions”](#).

23.2.5. Writing Plugins

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

A plugin contains code that becomes part of the running server, so when you write a plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see [Section 2.9.4, “MySQL Source-Configuration Options”](#), and [Section 2.9.5, “Dealing with Problems Compiling MySQL”](#).

This section provides a step-by-step guide to creating a plugin library. It shows how to develop a library that contains a full-text parsing plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters. For example plugin source code, see the [plugin/](#)

`fulltext` directory of MySQL source distributions.

Each plugin library has the following contents:

- A general plugin descriptor that indicates the version number of the general plugin API that the library uses and that contains a general declaration for each plugin in the library. The framework for this descriptor is supplied by referring to macros that expand to provide the API version automatically.
- Each general plugin descriptor contains information that is common to all types of plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; and pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin.
- The general plugin descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains an API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.
- The plugin library contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

The easiest way to follow the instructions in this section is to use the source code in the `plugin/fulltext` directory of MySQL source distributions. The instructions assume that you make a copy of that directory and use it to build the plugin library. To make a copy of the directory, use the following commands, which assume that the MySQL source tree is in a directory named `mysql-5.5` under your current directory:

```
shell> mkdir fulltext_plugin
shell> cp mysql-5.5/plugin/fulltext/* fulltext_plugin
```

After copying the source files, use the following procedure to create a plugin library:

1. Change location into the `fulltext_plugin` directory:

```
shell> cd fulltext_plugin
```

2. The plugin source file should include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

3. Set up the general plugin descriptor for the plugin library file.

Every plugin library must include a general descriptor that must define two symbols:

- `_mysql_plugin_interface_version` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each plugin in the library.

If the server does not find these two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The standard (and most convenient) way to define the two required symbols is by using the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin(name)
... one or more plugin declarations here ...
mysql_declare_plugin_end;
```

For example, the general plugin descriptor for a library that contains a single plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type
    &simple_parser_descriptor,  /* descriptor
    "simple_parser",            /* name
                                /* */
                                /* */
                                /* */
```

```

    "Oracle Corporation",      /* author          */
    "Simple Full-Text Parser", /* description     */
    PLUGIN_LICENSE_GPL,       /* plugin license */
    simple_parser_plugin_init,/* init function (when loaded) */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001,                  /* version         */
    simple_status,            /* status variables */
    simple_system_variables,  /* system variables */
    NULL
}
mysql_declare_plugin_end;

```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSE` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros like this:

```

#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS)
MYSQL_PLUGIN_EXPORT int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION;           \
MYSQL_PLUGIN_EXPORT int PSIZE= sizeof(struct st_mysql_plugin);             \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin DECLS[] = {                      \
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS)                   \
MYSQL_PLUGIN_EXPORT int __mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int __mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin __mysql_plugin_declarations_[] = { \
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
    builtin_ ## NAME ## __mysql_plugin_interface_version, \
    builtin_ ## NAME ## __mysql_sizeof_struct_st_plugin, \
    builtin_ ## NAME ## __mysql_plugin_declarations)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}

```

Note

Those declarations define the `__mysql_plugin_interface_version` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that you must provide `-DMYSQL_DYNAMIC_PLUGIN` as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`__mysql_plugin_interface_version` and `__mysql_plugin_declarations`):

```

int __mysql_plugin_interface_version_= MYSQL_PLUGIN_INTERFACE_VERSION;
int __mysql_sizeof_struct_st_plugin_= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin __mysql_plugin_declarations_[] = {
{
    MYSQL_FTPARSER_PLUGIN,        /* type          */
    &simple_parser_descriptor,   /* descriptor    */
    "simple_parser",              /* name          */
    "Oracle Corporation",        /* author        */
    "Simple Full-Text Parser",   /* description   */
    PLUGIN_LICENSE_GPL,          /* plugin license */
    simple_parser_plugin_init,   /* init function (when loaded) */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001,                      /* version       */
    simple_status,                /* status variables */
    simple_system_variables,     /* system variables */
    NULL
}, {0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}
};

```

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin()` and `mysql_declare_plugin_end`, separated by commas.

MySQL plugins can be written in C or C++ (or another language that can use C calling conventions). If you write a C++ plugin, one C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,        /* type          */
    &simple_parser_descriptor,   /* descriptor    */
    "simple_parser",              /* name          */
    "Oracle Corporation",        /* author        */
    "Simple Full-Text Parser",   /* description   */
    PLUGIN_LICENSE_GPL,          /* plugin license */

```

```

    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status, /* status variables */
    simple_system_variables, /* system variables */
    NULL
}
mysql_declare_plugin_end;

```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```

const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    simple_parser_name, /* name */
    simple_parser_author, /* author */
    simple_parser_description, /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status, /* status variables */
    simple_system_variables, /* system variables */
    NULL
}
mysql_declare_plugin_end;

```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```

typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "Oracle Corporation",
    "Simple Full-Text Parser"
};

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    parser_info.name, /* name */
    parser_info.author, /* author */
    parser_info.description, /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit,/* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status, /* status variables */
    simple_system_variables, /* system variables */
    NULL
}
mysql_declare_plugin_end;

```

4. Set up the type-specific plugin descriptor.

Each plugin declaration in the library descriptor points to a type-specific descriptor for the corresponding plugin. In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```

static struct st_mysql_ftparser simple_parser_descriptor=
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version */
    simple_parser_parse, /* parsing function */
    simple_parser_init, /* parser init function */
    simple_parser_deinit /* parser deinit function */
};

```

5. Set up the plugin interface functions.

The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server

should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void *arg __attribute__((unused)))
{
    return(0);
}

static int simple_parser_plugin_deinit(void *arg __attribute__((unused)))
{
    return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param
                             __attribute__((unused)))
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param
                               __attribute__((unused)))
{
    return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend= param->doc + param->length;

    for (end= start= param->doc; end++)
    {
        if (end == docend)
        {
            if (end > start)
                add_word(param, start, end - start);
            break;
        }
        else if (isspace(*end))
        {
            if (end > start)
                add_word(param, start, end - start);
            start= end + 1;
        }
    }
    return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
        { FT_TOKEN_WORD, 0, 0, 0, 0, ' ', 0 };

    param->mysql_add_word(param, word, len, &bool_info);
}
```

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described in [Section 23.2.4.3.1, “Full-Text Parser Plugin Data Structures and Functions”](#).

6. Set up the status variables, if there are any. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;
```

```
struct st_mysql_show_var simple_status[]=
{
    {"static", (char *)"just a static text", SHOW_CHAR},
    {"called", (char *)&number_of_calls,      SHOW_LONG},
    {0,0,0}
};
```

When the plugin is installed, the plugin name and the `name` value are joined with an underscore to form the name displayed by `SHOW STATUS`. For the array just shown, the resulting status variable names are `simple_parser_static` and `simple_parser_called`. This convention means that you can easily display the variables for a plugin using its name:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value   |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0          |
+-----+-----+
```

7. Compile the plugin library as a shared library and install it in the plugin directory.

The procedure for compiling shared objects varies from system to system. If you build your library using `CMake`, it should be able to generate the correct compilation commands for your system. If the library is named `mypluglib`, you should end up with a shared object file that has a name something like `libmypluglib.so`. (The file name might have a different extension on your system.)

To use `CMake`, you'll need to set up the configuration files to enable the plugin to be compiled and installed. Use the plugin examples under the `plugin` directory of a MySQL source distribution as a guide.

Create `CMakeLists.txt`, which should look something like this:

```
MYSQL_ADD_PLUGIN(mypluglib mypluglib.c
  MODULE_ONLY MODULE_OUTPUT_NAME "mypluglib")
```

When `CMake` generates the `Makefile`, it should take care of passing to the compilation command the `-DMYSQL_DYNAMIC_PLUGIN` flag, and passing to the linker the `-lmysqlservices` flag, which is needed to link in any functions from services provided through the plugin services interface. See [Section 23.2.6, “MySQL Services for Plugins”](#).

Run `CMake`, then run `make`:

```
shell> cmake .
shell> make
```

If you need to specify configuration options to `CMake`, see [Section 2.9.4, “MySQL Source-Configuration Options”](#), for a list. For example, you might want to specify `CMAKE_INSTALL_PREFIX` to indicate the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+-----+-----+
| Variable_name | Value   |
+-----+-----+
| base         | /usr/local/mysql |
+-----+-----+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+-----+
| Variable_name | Value   |
+-----+-----+
| plugin_dir   | /usr/local/mysql/lib/mysql/plugin |
+-----+-----+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

8. Register the plugin with the server.

The `INSTALL PLUGIN` statement causes the server to register the plugin in the `mysql.plugin` table and to load the plugin code from the library file. Use that statement to register `simple_parser` with the server, and then verify that the plugin is listed in the `mysql.plugin` table:

```
mysql> INSTALL PLUGIN simple_parser SONAME 'libmypluglib.so';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM mysql.plugin;
+-----+-----+
| name | dl |
+-----+-----+
| simple_parser | libmypluglib.so |
+-----+-----+
1 row in set (0.00 sec)
```

For additional information about plugin loading, see [Section 12.4.3.1, “Installing and Uninstalling Plugins”](#).

9. Try the plugin.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
->   FULLTEXT (c) WITH PARSER simple_parser
-> ) ENGINE=MyISAM;
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
->   ('latin1_general_cs is a case-sensitive collation'),
->   ('I\'d like a case of oranges'),
->   ('this is sensitive information'),
->   ('another row'),
->   ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0

mysql> SELECT c FROM t;
+-----+
| c |
+-----+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges |
| this is sensitive information |
| another row |
| yet another row |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.00 sec)

mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
| 0 |
| 0 |
| 1.3253291845322 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
| 1.3109166622162 |
| 0 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-----+
```

```
| MATCH(c) AGAINST('I\'d') |
+-----+
|          0 |
| 1.2968142032623 |
|          0 |
|          0 |
|          0 |
+-----+
5 rows in set (0.01 sec)
```

Note how neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

23.2.5.1. Writing Full-Text Parser Plugins

A full-text parser server plugin can be used to replace or modify the built-in full-text parser. The procedure described in [Section 23.2.5, “Writing Plugins”](#), demonstrates how to write such a plugin.

23.2.5.2. Writing Audit Plugins

This section describes how to write audit server plugins, using the example plugin found in the `plugin/audit_null` directory of MySQL source distributions. Other audit plugins can be written using similar principles. For general information about writing plugins, see [Section 23.2.5, “Writing Plugins”](#).

This description includes references to audit plugin interface elements that are present only as of MySQL 5.5.5:

- The `event_subclass` member of `struct mysql_event_general`
- Status variables that count notifications for individual event subclasses

A plugin that requires those elements must be compiled against MySQL source for which the value of `MYSQL_AUDIT_INTERFACE_VERSION`, the type-specific interface version, is `0x0200` or greater.

On the server side, the pluggable audit interface is implemented in the `sql_audit.h` and `sql_audit.cc` files in the `sql` directory of MySQL source distributions. Additionally, a few other places in the server are modified to call the audit interface when an auditable event occurs, so that registered audit plugins can be notified about the event if necessary. To see where such calls occur, look for invocations of functions with names of the form `mysql_audit_xxx()`. Audit notification occurs for these server operations:

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

These events are all treated as subclasses of the “general” event class.

On the plugin side, an audit plugin uses the interface defined in `plugin_audit.h`, which includes `plugin.h` for general plugin interface information. These include files are located in the `include/mysql` directory. The `audit_null.c` source file in the `plugin/audit_null` directory implements a simple example audit plugin named `NULL_AUDIT`.

An audit plugin, like any MySQL plugin, has a general plugin descriptor (see [Section 23.2.4.1, “General Plugin Data Structures and Functions”](#)). In `audit_null.c`, the general descriptor looks like this:

```
mysql_declare_plugin(audit_null)
{
    MYSQL_AUDIT_PLUGIN,           /* type */
    &audit_null_descriptor,       /* descriptor */
    "NULL_AUDIT",                /* name */
    "Oracle Corporation",         /* author */
    "Simple NULL Audit",         /* description */
    PLUGIN_LICENSE_GPL,
    audit_null_plugin_init,      /* init function (when loaded) */
    audit_null_plugin_deinit,    /* deinit function (when unloaded) */
    0x0001,                      /* version */
    simple_status,               /* status variables */
    NULL,                        /* system variables */
    NULL
}
mysql_declare_plugin_end;
```

The `name` field (`NULL_AUDIT`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN`

or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `audit_null_descriptor` value in the general descriptor points to the type-specific descriptor, which is described later.

The general descriptor also refers to `simple_status`, a structure that exposes several status variables to the `SHOW STATUS` statement:

```
static struct st_mysql_show_var simple_status[]=
{
    { "Audit_null_called", (char *) &number_of_calls, SHOW_INT },
    { "Audit_null_general_log", (char *) &number_of_calls_general_log,
      SHOW_INT },
    { "Audit_null_general_error", (char *) &number_of_calls_general_error,
      SHOW_INT },
    { "Audit_null_general_result", (char *) &number_of_calls_general_result,
      SHOW_INT },
    { 0, 0, 0 }
};
```

The `audit_null_plugin_init` initialization function sets the status variables to zero when the plugin is loaded. The `audit_null_plugin_deinit` function performs cleanup with the plugin is unloaded. During operation, the plugin increments the first variable for each notification it receives. It increments the others according to the event subclass. In effect, the first variable is the aggregate of the counts for the event subclasses.

Audit plugins have a type-specific descriptor with this structure:

```
struct st_mysql_audit
{
    int interface_version;
    void (*release_thd)(MYSQL_THD);
    void (*event_notify)(MYSQL_THD, const struct mysql_event *);
    unsigned long class_mask[MYSQL_AUDIT_CLASS_MASK_SIZE];
};
```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For audit plugins, the value of the `interface_version` field is `MYSQL_AUDIT_INTERFACE_VERSION` (defined in `plugin_audit.h`).
- `release_thd`: A function that the server calls to inform the plugin that it is being dissociated from its thread context. This should be `NULL` if there is no such function.
- `event_notify`: A function that the server calls to notify the plugin that an auditable event has occurred. This function should not be `NULL`; that would not make sense because no auditing would occur.
- `class_mask`: A bit mask that indicates the event classes for which the plugin wants to receive notification.

The server uses the `event_notify` and `release_thd` functions together. They are called within the context of a specific thread, and a thread might perform an activity that produces several event notifications. The first time the server calls `event_notify` for a thread, it creates a binding of the plugin to the thread. The plugin cannot be uninstalled while this binding exists. When no more events for the thread will occur, the server informs the plugin of this by calling the `release_thd` function, and then destroys the binding. For example, when a client issues a statement, the thread processing the statement might notify audit plugins about the result set produced by the statement and about the statement being logged. After these notifications occur, the server releases the plugin before putting the thread to sleep until the client issues another statement.

This design enables the plugin to allocate resources needed for a given thread in the first call to the `event_notify` function and release them in the `release_thd` function:

```
event_notify function:
    if memory is needed to service the thread
        allocate memory
        ... rest of notification processing ...

release_thd function:
    if memory was allocated
        release memory
        ... rest of release processing ...
```

That is more efficient than allocating and releasing memory repeatedly in the notification function.

For the example audit plugin, the type-specific descriptor looks like this:

```
static struct st_mysql_audit audit_null_descriptor=
{
```

```

MYSQL_AUDIT_INTERFACE_VERSION,           /* interface version */
NULL,                                     /* release_thd function */
audit_null_notify,                         /* notify function */
{ (unsigned long) MYSQL_AUDIT_GENERAL_CLASSMASK } /* class mask */
};

```

The server calls `audit_null_notify` to pass audit event information to the plugin. There is no `release_thd` function.

The event class mask indicates an interest in all events of the “general” class. Currently, that is the only event class. `plugin_audit.h` defines its symbol, `MYSQL_AUDIT_GENERAL_CLASS`, and a mask with a bit for this class:

```
#define MYSQL_AUDIT_GENERAL_CLASS 0
#define MYSQL_AUDIT_GENERAL_CLASSMASK (1 << MYSQL_AUDIT_GENERAL_CLASS)
```

In the type-specific descriptor, the second parameter of the `event_notify` function prototype is a generic `mysql_event` pointer:

```
void (*event_notify)(MYSQL_THD, const struct mysql_event *);
```

The server actually passes the notification function a pointer to a structure that depends on the event class. The first member of all event structures must indicate the event class to enable the notification function to determine what kind of structure it was passed so that it can tell what other structure members exist.

The server passes events in the “general” event class to the `event_notify` function using this structure:

```

struct mysql_event_general
{
    unsigned int event_class;
    unsigned int event_subclass;
    int general_error_code;
    unsigned long general_thread_id;
    const char *general_user;
    unsigned int general_user_length;
    const char *general_command;
    unsigned int general_command_length;
    const char *general_query;
    unsigned int general_query_length;
    struct charset_info_st *general_charset;
    unsigned long long general_time;
    unsigned long long general_rows;
};

```

Audit plugins can interpret `mysql_event_general` members as follows:

- `event_class`: The event class, always `MYSQL_AUDIT_GENERAL_CLASS` for “general” events.
- `event_subclass`: The event subclass, one of the following values:

```
#define MYSQL_AUDIT_GENERAL_LOG 0
#define MYSQL_AUDIT_GENERAL_ERROR 1
#define MYSQL_AUDIT_GENERAL_RESULT 2
```

- `general_error_code`: The error code. This is a value like that returned by the `mysql_errno()` C API function; 0 means “no error.”
- `general_thread_id`: The ID of the thread for which the event occurred.
- `general_user`: The current user for the event.
- `general_user_length`: The length of `general_user`, in bytes.
- `general_command`: For general query log events, the type of operation. Examples: `Connect`, `Query`, `Shutdown`. For error log events, the error message. This is a value like that returned by the `mysql_error()` C API function; an empty string means “no error.” For result events, this is empty.
- `general_command_length`: The length of `general_command`, in bytes.
- `general_query`: The SQL statement that was logged or produced a result.
- `general_query_length`: The length of `general_query`, in bytes.
- `general_charset`: Character set information for the event.
- `general_time`: A `TIMESTAMP` value indicating the time just before the notification function was called.

- **general_rows**: For general query log events, zero. For error log events, the row number at which an error occurred. For result events, the number of rows in the result plus one. For statements that produce no result set, the value is 0. This encoding enables statements that produce no result set to be distinguished from those that produce an empty result set. For example, for a `DELETE` statement, this value is 0. For a `SELECT`, the result is always 1 or more, where 1 represents an empty result set.

When you build MySQL from source, the example audit plugin is configured in and built by default. No special configuration options are needed to cause it to be compiled. The build process produces a shared object library with a name of `adt_null.so` (the extension might be different depending on your platform). This library file is installed in the plugin directory (the directory named by the `plugin_dir` system variable).

To install the plugin at runtime, use this statement (change the extension as necessary):

```
mysql> INSTALL PLUGIN NULL_AUDIT SONAME 'adt_null.so';
```

Alternatively, install the plugin at server startup. For example, use these lines in a `my.cnf` file:

```
[mysqld]
plugin-load=null_audit=adt_null.so
```

In this case, the plugin is not installed permanently. Restarting without the `plugin-load` option causes the plugin not to be loaded at startup.

For additional information about plugin loading, see [Section 12.4.3.1, “Installing and Uninstalling Plugins”](#).

Use `SHOW PLUGINS` to verify plugin installation or examine the `INFORMATION_SCHEMA.PLUGINS` table.

While the audit plugin is installed, it exposes status variables that indicate how the plugin has been called:

```
mysql> SHOW STATUS LIKE 'Audit_null%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Audit_null_called | 2
| Audit_null_general_error | 0
| Audit_null_general_log | 1
| Audit_null_general_result | 1
+-----+-----+
```

`Audit_null_called` counts all events for any subclass of the “general” class, and the others count instances of each event subclass. The preceding `SHOW STATUS` statement causes the server to send a result to the client and to write a message to the general query log if that log is enabled. Thus, a client that issues the statement repeatedly causes `Audit_null_called` and `Audit_null_general_result` to be incremented each time and `Audit_null_general_log` to be incremented if the log is enabled.

23.2.6. MySQL Services for Plugins

MySQL server plugins have access to server “services.” The services interface exposes server functionality that plugins can call. It complements the plugin API and has these characteristics:

- Services enable plugins to access code inside the server using ordinary function calls.
- Services are portable and work on multiple platforms.
- The interface includes a versioning mechanism so that service versions supported by the server can be checked at load time against plugin versions. Versioning protects against incompatibilities between the version of a service that the server provides and the version of the service expected or required by a plugin.

Current services include `my_snprintf` and `thd_alloc`, and others can be implemented:

- `my_snprintf` provides a string-formatting service that produces consistent results across platforms.
- `thd_alloc` provides a memory-allocation service.

The plugin services interface differs from the plugin API as follows:

- The plugin API enables plugins to be used by the server. The calling initiative lies with the server to invoke plugins. This en-

ables plugins to extend server functionality or register to receive notifications about server processing.

- The plugin services interface enables plugins to call code inside the server. The calling initiative lies with plugins to invoke service functions. This enables functionality already implemented in the server to be used by many plugins; they need not individually implement it themselves.

For developers who wish to modify the server to add a new service, see [MySQL Services for Plugins](#) in the MySQL Internals Manual.

The remainder of this section describes how a plugin uses server functionality that is available as a service. See also the source for the “daemon” example plugin, which uses this service. Within a MySQL source distribution, that plugin is located in the `plugin/daemon_example` directory.

To determine what services exist and what functions they provide, look in the `include/mysql` directory of a MySQL source distribution. The relevant files are:

- `plugin.h` includes `services.h`.
- `services.h` is the “umbrella” header that includes all available service-specific header files.
- Service-specific headers have names like `service_my_snprintf.h` or `service_thd_alloc.h`.

Each service-specific header should contain comments that provide full usage documentation for a given service, including what service functions are available, their calling sequences, and return values.

After you decide which service or services you want to use from within a plugin, there is really no setup involved, other than to include the `plugin.h` header file to access service-related information:

```
#include <mysql/plugin.h>
```

But a plugin must include that file anyway because it contains definitions and structures that every plugin needs.

To access a service, a plugin calls service functions like any other function. For example, to format a string into a buffer for printing, call the `my_snprintf()` function provided by the service of the same name:

```
char buffer[BUFFER_SIZE];
my_snprintf(buffer, sizeof(buffer), format_string, argument_to_format, ...);
```

When you build your plugin, you must link in the `libmysqlservices` library. Use the `-lmysqlservices` flag at link time. For example, the `Makefile.am` file for a plugin might look like this:

```
pkgplugindir=$(pkglibdir)/plugin
INCLUDES=-I$(top_builddir)/include -I$(top_srcdir)/include
pkgplugin_LTLIBRARIES= mypluglib_la
mypluglib_la_SOURCES= plugin_example.c
mypluglib_la_LDFLAGS= -module -rpath $(pkgplugindir) \
                     -L$(libdir)/mysql -lmysqlservices
mypluglib_la_CFLAGS= -DMYSQL_DYNAMIC_PLUGIN
```

23.3. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 12.4.3.2, “CREATE FUNCTION Syntax for User-Defined Functions”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Section 19.2, “Using Stored Routines \(Procedures and Functions\)”](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function in to the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See [Section 8.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

23.3.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

23.3.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.9.4, “MySQL Source-Configuration Options”](#), and [Section 2.9.5, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link `mysqld` dynamically. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`).

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

Note

When using C++ you can encapsulate your C functions within:

```
extern "C" { ... }
```

This will ensure that your C++ function names remain readable in the completed UDF.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
STRING	<code>char *</code>
INTEGER	<code>long long</code>
REAL	<code>double</code>

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `xxx()`.
- To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows have been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

23.3.2.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 23.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
            char *is_null, char *error);
```

`DECIMAL` functions return string values and should be declared the same way as `STRING` functions. `ROW` functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to `1` if `xxx()` can return `NULL`. The default value is `1` if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be `3`, because `1.345` has `3` decimal digits.

For arguments that have no fixed number of decimals, the `decimals` value is set to `31`, which is `1` more than the maximum number of decimals permitted for the `DECIMAL`, `FLOAT`, and `DOUBLE` data types. As of MySQL `5.5.3`, this value is available as the constant `NOT_FIXED_DEC` in the `mysql_com.h` header file.

A `decimals` value of `31` is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10, 3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `NOT_FIXED_DEC` for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is `21` digits. For real functions, the default is `13` plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the

length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

`xxx_init()` should set `const_item` to `1` if `xxx()` always returns the same value and to `0` otherwise.

23.3.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 23.3.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.5, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.5.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See [Section 23.3.2.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See [Section 23.3.2.4, “UDF Return](#)

Values and Error Handling”.

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See Section 23.3.2.3, “UDF Argument Processing”.

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error!` `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

23.3.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message,"XXX() requires two arguments");
    return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count` – 1.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message,"XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is `0`. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently be-

ing processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.
- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5
args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6
args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

23.3.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function using the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multi-byte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See [Section 23.3.2.1, “UDF Calling Sequences for Simple Functions”](#).

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

23.3.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in MySQL source distributions.

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP address for a host name.
- `reverse_lookup()` returns the host name for an IP address. The function may be called either with a single string argument of the form '`xxx.xxx.xxx.xxx`' or with four numbers.
- `avgcost()` returns an average cost. This is an aggregate function.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `CMake` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. Obtain a MySQL source distribution. See [Section 2.1.3, “How to Get MySQL”](#).
2. Obtain the `CMake` build utility, if necessary, from <http://www.cmake.org>. (Version 2.6 or later is required).
3. In the source tree, look in the `sql` directory. There are files named `udf_example.def` `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a `CMake` **makefile** (`CMakeLists.txt`) with these contents:

```
PROJECT(udf_example)
# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")
ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example ws2_32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with the following statements. If object files have a suffix different from `.so` on your system, substitute the correct suffix throughout (for example, `.dll` on Windows).

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
      -> RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
      -> RETURNS REAL SONAME 'udf_example.so';
```

To delete functions, use `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` or `DELETE` privilege for the `mysql` database to create or drop functions, respectively.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

23.3.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

23.3.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:

- If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.
- If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.

2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

```
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

23.4. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

23.4.1. PROCEDURE ANALYSE

```
ANALYSE([max_elements[,max_memory]])
```

`ANALYSE()` is defined in the `sql/sql_analyse.cc` source file, which serves as an example of how to create a procedure for use with the `PROCEDURE` clause of `SELECT` statements. `ANALYSE()` is built in and is available by default; other procedures can be created using the format demonstrated in the source file.

`ANALYSE()` examines the result from a query and returns an analysis of the results that suggests optimal data types for each column that may help reduce table sizes. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- `max_elements` (default 256) is the maximum number of distinct values that `ANALYSE()` notices per column. This is used by `ANALYSE()` to check whether the optimal data type should be of type `ENUM`; if there are more than `max_elements` distinct values, then `ENUM` is not a suggested type.
- `max_memory` (default 8192) is the maximum amount of memory that `ANALYSE()` should allocate per column while trying to find all distinct values.

23.4.2. Writing a Procedure

You can find information about procedures by examining the following source files:

- `sql/sql_analyse.cc`

- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

See also [Writing a Procedure](#) at MySQL Forge.

23.5. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.1.1, “Operating Systems Supported by MySQL Community Server”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note

If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server.

To build MySQL from source, your system must satisfy the tool requirements listed at [Section 2.9, “Installing MySQL from Source”](#).

Important

If you are trying to build MySQL 5.5 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see [Bug#21875](#).)

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 23.5.1, “Debugging a MySQL Server”](#).

Note

Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

23.5.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section C.5.4.2, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, MySQL Server Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.1, “General Installation Guidance”](#).

23.5.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `-DWITH_DEBUG=1` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If `mysqld` stops crashing when you compile it with `-DWITH_DEBUG=1`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` environment variables and not use `-DWITH_DEBUG=1`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.6.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.7, “How to Report Bugs or Problems”](#).

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

23.5.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

The trace file can become **very large!** To generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the **BUG** package by Fred Fish. See [Section 23.5.3, “The BUG Package”](#).

23.5.1.3. Using `pdb` to create a Windows crashdump

Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with WinDbg, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

```
C:\> drwtsn32 -i
```

2. Set the **LOG FILE PATH** to the directory where you want to store trace files.

3. Make sure **DUMP ALL THREAD CONTEXTS** and **APPEND TO EXISTING LOG FILE**.

4. Uncheck **DUMP SYMBOL TABLE**, **VISUAL NOTIFICATION**, **SOUND NOTIFICATION** and **CREATE CRASH DUMP FILE**.
5. Set the **NUMBER OF INSTRUCTIONS** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can become very large.

23.5.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb` 5.1 because thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5`' helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section C.5.4.2, “What to Do If MySQL Keeps Crashing”](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

23.5.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.2.2, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See [Section 23.5.1.1, “Compiling MySQL for Debugging”](#).

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strncmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcs2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4List112set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

```
0x9da402
0x6648e9
0x7f1a5af000f0
0x7f1a5a10f0f2
0x7412cb
0x688354
0x688494
0x67a170
0x67f0ad
0x67fdf8
0x6811b6
0x66e05e
```

2. Make a symbol file for the `mysqld` server:

```
shell> nm -n libexec/mysqld > /tmp/mysqld.sym
```

If `mysqld` is not linked statically, use the following command instead:

```
shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
```

If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
```

If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
```

This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.7, “How to Report Bugs or Problems”](#).

23.5.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See [Chapter 5, MySQL Server Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See [Section 5.2.3, “The General Query Log”](#). When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 12.8.2, “`EXPLAIN` Syntax”](#).

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See [Section 5.2.5, “The Slow Query Log”](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, MySQL Server Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file '`Warning: Checking table ...`' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.1.2, “Server Command Options”](#).

As of MySQL 5.5.3, when the server detects MyISAM table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

23.5.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).

- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/* .MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with the binary log enabled. If you want to find a query that crashes `mysqld`, you should start the server with both the general query log enabled as well. See [Section 5.2.3, “The General Query Log”](#), and [Section 5.2.4, “The Binary Log”](#).
- When you have gotten a crashed table, stop the `mysqld server`.
- Restore the backup.
- Restart the `mysqld` server **without** the binary log enabled.
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to <http://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in [Section 1.7, “How to Report Bugs or Problems”](#). (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

23.5.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `-DWITH_DEBUG=1`. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:0,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:0,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See [Section 1.7, “How to Report Bugs or Problems”](#).

If your client crashes at some ‘legal’ looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

23.5.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See [Section 23.5.1.2, “Creating Trace Files”](#).

This section summaries the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional “,” and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The following table shows the currently recognized flag characters.

Flag	Description
<code>d</code>	Enable output from DBUG_<N> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
<code>D</code>	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>-#D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.
<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>g</code>	Enable profiling. Create a file called <code>debugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>p</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>s</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0.
<code>t</code>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t  
-#d:f,main,subr1:F:L:t,20  
-#d,input,output,files:n  
-#d:t:i:O,\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

Appendix A. Licenses for Third-Party Components

The following is a list of the libraries we have included with the MySQL Server source and components used to test MySQL. We are thankful to all individuals that have created these. Some of the components require that their licensing terms be included in the documentation of products that include them. Cross references to these licensing terms are given with the applicable items in the list.

- GroupLens Research Project

The MySQL Quality Assurance team would like to acknowledge the use of the MovieLens Data Sets (10 million ratings and 100,000 tags for 10681 movies by 71567 users) to help test MySQL products and to thank the GroupLens Research Project at the University of Minnesota for making the data sets available.

THIS PRODUCT ALSO INCLUDES THIRD PARTY SOFTWARE REDISTRIBUTED UNDER THE FOLLOWING LICENSES:
JUnit, Common Public License Version 1.0 (junit-3.8.1.jar)
<http://junit.org>

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS COMMON PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:

- a) in the case of the initial Contributor, the initial code and documentation distributed under this Agreement, and
- b) in the case of each subsequent Contributor:
 - i) changes to the Program, and
 - ii) additions to the Program; where such changes and/or additions to the Program originate from and are distributed by that particular Contributor. A Contribution 'originates' from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include additions to the Program which:
 - (i) are separate modules of software distributed in conjunction with the Program under their own license agreement, and (ii) are not derivative works of the Program.

"Contributor" means any person or entity that distributes the Program.

"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement, including all Contributors.

2. GRANT OF RIGHTS

- a) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form.
- b) Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.
- c) Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.
- d) Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

3. REQUIREMENTS

A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that:

- a) it complies with the terms and conditions of this Agreement; and
- b) its license agreement:

- i) effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;
- ii) effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;
- iii) states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and
- iv) states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange.

When the Program is made available in source code form:

- a) it must be made available under this Agreement; and
- b) a copy of this Agreement must be included with each copy of the Program.

Contributors may not remove or alter any copyright notices contained within the Program.

Each Contributor must identify itself as the originator of its Contribution, if any, in a manner that reasonably allows subsequent Recipients to identify the originator of the Contribution.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes the Program in a commercial product offering, such Contributor ("Commercial Contributor") hereby agrees to defend and indemnify every other Contributor ("Indemnified Contributor") against any losses, damages and costs (collectively "Losses") arising from claims, lawsuits and other legal actions brought by a third party against the Indemnified Contributor to the extent caused by the acts or omissions of such Commercial Contributor in connection with its distribution of the Program in a commercial product offering. The obligations in this section do not apply to any claims or Losses relating to any actual or alleged intellectual property infringement. In order to qualify, an Indemnified Contributor must: a) promptly notify the Commercial Contributor in writing of such claim, and b) allow the Commercial Contributor to control, and cooperate with the Commercial Contributor in, the defense and any related settlement negotiations. The Indemnified Contributor may participate in any such claim at its own expense.

For example, a Contributor might include the Program in a commercial product offering, Product X. That Contributor is then a Commercial Contributor. If that Commercial Contributor then makes performance claims, or offers warranties related to Product X, those performance claims and warranties are such Commercial Contributor's responsibility alone. Under this section, the Commercial Contributor would have to defend claims against the other Contributors related to those performance claims and warranties, and if a court requires any other Contributor to pay any damages as a result, the Commercial Contributor must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, THE PROGRAM IS PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible for determining the appropriateness of using and distributing the Program and assumes all risks associated with its exercise of rights under this Agreement, including but not limited to the risks and costs of program errors, compliance with applicable laws, damage to or loss of data, programs or equipment, and unavailability or interruption of operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against a Contributor with respect to a patent applicable to software (including a cross-claim or counterclaim in a lawsuit), then any patent licenses granted by that Contributor to such Recipient under this Agreement shall terminate as of the date such litigation is filed. In addition, if Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. IBM is the initial Agreement Steward. IBM may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to distribute the Program (including its Contributions) under the new version. Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved.

This Agreement is governed by the laws of the State of New York and the intellectual property laws of the United States of America. No party to this Agreement will bring a legal action under this Agreement more than one year after the cause of action arose. Each party waives its rights to a jury trial in any resulting litigation.

A.23. Apache License Version 2.0, January 2004

The following applies to all products licensed under the Apache 2.0 License: You may not use the identified files except in compliance with the Apache License, Version 2.0 (the "License.") You may obtain a copy of the License at <http://www.apache.org/licenses/LICENSE-2.0>. A copy of the license is also reproduced below. Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See the License for the specific language governing permissions and limitations under the License.

Apache License Version 2.0, January 2004 <http://www.apache.org/licenses/>
TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this

License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained

within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licenser shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licenser regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licenser, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licenser provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also

recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

A.33. Cairo License

The following software may be included in this product:

Cairo

You are receiving a copy of the Cairo in both source

```
and object code in the following DLL (libcairo.dll) or
dynamic libraries
(MySQLWorkbench.app/Contents/Frameworks/libcairo.2.dylib
and MySQLWorkbench.app/Contents/Frameworks/libpixman-1.0.dylib).
The terms of the Oracle license do NOT apply to Cairo;
Oracle distributes it under the GNU Lesser General Public
License Version 2.1 separately from the Oracle programs you
receive. You can also separately obtain and use Cairo
independent of the Oracle programs under a dual license
subject to the terms of the LGPL or the Mozilla Public
License Version 1.1. If you do not wish to install this
program, you may delete libcairo.dll or libcairo.2.dylib
and libpixman-1.0.dylib from the installation directory
or uninstall MySQL Workbench completely.
```

This component is licensed under [Section A.45, “GNU Lesser General Public License Version 2.1, February 1999”](#).

A.34. CTemplate (Google Template System) License

The following software may be included in this product:

```
CTemplate (Google Template System)

A.40. Fred Fish's Dbug Library License

The following software may be included in this product:

Fred Fish's Dbug Library

NOTICE

Copyright Abandoned, 1987, Fred Fish

This previously copyrighted work has been placed into the public

domain by the author and may be freely used for any purpose, private or commercial.

Because of the number of inquiries I was receiving about the use of this product in commercially developed works I have decided to simply make it public domain to further its unrestricted use. I specifically would be most happy to see this material become a part of the standard Unix distributions by AT&T and the Berkeley Computer Science Research Group, and a standard part of the GNU system from the Free Software Foundation.

I would appreciate it, as a courtesy, if this notice is left in all copies and derivative works. Thank you.

The author makes no warranty of any kind with respect to this product and explicitly disclaims any implied warranties of merchantability or fitness for any particular purpose.

The dbug_analyze.c file is subject to the following notice:

Copyright June 1987, Binayak Banerjee
All rights reserved.

This program may be freely distributed under the same terms and conditions as Fred Fish's Dbug package.

A.41. FreeMarker License

The following software may be included in this product:

FreeMarker

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim
copies of this license document, but changing it is not
allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion

of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying

the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details
type 'show w'. This is free software, and you are welcome
to redistribute it under certain conditions; type 'show c'
for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License.

A.45. GNU Lesser General Public License Version 2.1, February 1999

The following applies to all products licensed under the GNU Lesser General Public License, Version 2.1: You may not use the identified files except in compliance with the GNU Lesser General Public License, Version 2.1 (the "License.") You may obtain a copy of the License at <http://www.gnu.org/licenses/lgpl-2.1.html>. A copy of the license is also reproduced below. Unless required by applicable law or agreed to in writing, software distributed under the License is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied. See the License for the specific language governing permissions and limitations under the License.

GNU LESSER GENERAL PUBLIC LICENSE
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your

freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must

be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) The modified work must itself be a software library.
- b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
- d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at

least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to

be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library 'Frob' (a library for tweaking knobs) written by James

Random Hacker.
<signature of Ty Coon>, 1 April 1990
Ty Coon, President of Vice
That's all there is to it!

A.46. GNU Libtool License

The following software may be included in this product:

GNU Libtool (The GNU Portable Library Tool)

If you are receiving a copy of the Oracle software in source code, you are also receiving a copy of two files (ltmain.sh and ltdl.h) generated by the GNU Libtool in source code. If you received the Oracle software under a license other than a commercial (non-GPL) license, then the terms of the Oracle license do NOT apply to these files from GNU Libtool; they are licensed under the following licenses, separately from the Oracle programs you receive.

Oracle elects to use GNU General Public License version 2 (GPL) for any software where a choice of GPL or GNU Lesser/Library General Public License (LGPL) license versions are made available with the language indicating that GPL/LGPL or any later version may be used, or where a choice of which version of the GPL/LGPL is applied is unspecified.

From GNU Libtool:

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
License is intended to guarantee your freedom to share and change free
software--to make sure the software is free for all its users. This
General Public License applies to most of the Free Software
Foundation's software and to any other program whose authors commit to
using it. (Some other Free Software Foundation software is covered by
the GNU Lesser General Public License instead.) You can apply it to
your programs, too.

When we speak of free software, we are referring to freedom, not
price. Our General Public Licenses are designed to make sure that you
have the freedom to distribute copies of free software (and charge for
this service if you wish), that you receive source code or can get it
if you want it, that you can change the software or use pieces of it
in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid
anyone to deny you these rights or to ask you to surrender the rights.
These restrictions translate to certain responsibilities for you if you
distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether
gratis or for a fee, you must give the recipients all the rights that
you have. You must make sure that they, too, receive or can get the
source code. And you must show them these terms so they know their
rights.

We protect your rights with two steps: (1) copyright the software,
and (2) offer you this license which gives you legal permission to
copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain
that everyone understands that there is no warranty for this free
software. If the software is modified by someone else and passed on,
we want its recipients to know that what they have is not the original,
so that any problems introduced by others will not reflect on the
original authors' reputations.

Finally, any free program is threatened constantly by software
patents. We wish to avoid the danger that redistributors of a free
program will individually obtain patent licenses, in effect making the
program proprietary. To prevent this, we have made it clear that any
patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and
modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law; that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source

code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we

sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details
type 'show w'. This is free software, and you are welcome
to redistribute it under certain conditions; type 'show c'
for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License.

A.48. GNU Readline License

The following software may be included in this product:

GNU Readline Library

```
GNU Readline Library
With respect to MySQL Server/Cluster software licensed
under GNU General Public License, you are receiving a
copy of the GNU Readline Library in source code. The
terms of any Oracle license that might accompany the
Oracle programs do NOT apply to the GNU Readline Library;
it is licensed under the following license, separately
from the Oracle programs you receive. Oracle elects to
use GNU General Public License version 2 (GPL) for any
software where a choice of GPL license versions are
made available with the language indicating that GPLv2
or any later version may be used, or where a choice of
which version of the GPL is applied is unspecified.
```

This component is licensed under [Section A.44, “GNU General Public License Version 2.0, June 1991”](#)

A.49. Google Controlling Master Thread I/O Rate Patch License

The following software may be included in this product:

Google Controlling master thread I/O rate patch

```

A.52. JDOM Project License

The following software may be included in this product:

JDOM

This product includes software developed by the JDOM Project (<http://www.jdom.org/>).

Copyright (C) 2000-2004 Jason Hunter & Brett McLaughlin.
All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, this list of conditions, and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions, and the disclaimer that follows these conditions in the documentation and/or other materials provided with the distribution.
3. The name "JDOM" must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact <request_AT_jdom_DOT_org>.
4. Products derived from this software may not be called "JDOM", nor may "JDOM" appear in their name, without prior written permission from the JDOM Project Management <request_AT_jdom_DOT_org>.

In addition, we request (but do not require) that you include in the end-user documentation provided with the redistribution and/or in the software itself an acknowledgement equivalent to the following:

"This product includes software developed by the
JDOM Project (<http://www.jdom.org/>)."

Alternatively, the acknowledgment may be graphical using the logos available at <http://www.jdom.org/images/logos>.

THIS SOFTWARE IS PROVIDED "AS IS" AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE JDOM AUTHORS OR THE PROJECT CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This software consists of voluntary contributions made by many individuals on behalf of the JDOM Project and was originally created by Jason Hunter and Brett McLaughlin. For more information on the JDOM Project, please see <<http://www.jdom.org/>>."

A.53. jQuery License

The following software may be included in this product:

jQuery

Copyright (c) 2009 John Resig.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

A.54. jQuery UI License

The following software may be included in this product:

jQuery UI

Copyright (c) 2009 Paul Bakaus, <http://jqueryui.com>

This software consists of voluntary contributions made by many individuals (AUTHORS.txt, <http://jqueryui.com/about>) For exact contribution history, see the revision history and logs, available at <http://jquery-ui.googlecode.com/svn/>

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

A.55. lib_sql.cc License

The following software may be included in this product:

lib_sql.cc

Copyright (c) 2000
SWsoft company

This material is provided "as is", with absolutely no warranty expressed or implied. Any use is at your own risk.

Permission to use or copy this software for any purpose is hereby granted without fee, provided the above notices are retained on all copies. Permission to modify the code and to distribute modified code is granted, provided the above notices are retained, and a notice that the code was modified is included with the above copyright notice.

This code was modified by the MySQL team.

A.56. libevent License

The following software may be included in this product:

```
libevent

Copyright (c) 2000-2007 Niels Provos <provos@citi.umich.edu>
All rights reserved.

Redistribution and use in source and binary forms, with or without
modification, are permitted provided that the following conditions
are met:
1. Redistributions of source code must retain the above copyright
   notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright
   notice, this list of conditions and the following disclaimer in the
   documentation and/or other materials provided with the distribution.
3. The name of the author may not be used to endorse or promote products
   derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE AUTHOR ``AS IS'' AND ANY EXPRESS OR
IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES
OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED.
IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT,

CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR
IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER
DEALINGS IN THE SOFTWARE.

Except as contained in this notice, the name of Daniel
Veillard shall not be used in advertising or otherwise
to promote the sale, use or other dealings in this
Software without prior written authorization from him.
```

A.58. Libzip License

The following software may be included in this product:

```
libzip

Copyright (C) 1999-2008 Dieter Baron and Thomas Klausner
The authors can be contacted at <libzip@nih.at>

Redistribution and use in source and binary forms, with or without
modification, are permitted provided that the following conditions
are met:
1. Redistributions of source code must retain the above copyright
   notice, this list of conditions and the following disclaimer.
```

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. The names of the authors may not be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE AUTHORS "AS IS" AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

A.59. Linux-PAM License

The following software may be included in this product:

Linux-PAM (pam-devel, Pluggable authentication modules for Linux)

Copyright Theodore Ts'o, 1996. All rights reserved.

(For the avoidance of doubt, Oracle uses and distributes this component under the terms below and elects not to do so under the GPL even though the GPL is referenced as an option below.)

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the above copyright notice, and the entire permission notice in its entirety, including the disclaimer of warranties.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. The name of the author may not be used to endorse or promote products derived from this software without specific prior written permission.

ALTERNATIVELY, this product may be distributed under the terms of the GNU Public License, in which case the provisions of the GPL are required INSTEAD OF the above restrictions. (This clause is necessary due to a potential bad interaction between the GPL and the restrictions contained in a BSD-style copyright.)

THIS SOFTWARE IS PROVIDED ``AS IS'' AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHOR BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

A.60. LPEG Library License

The following software may be included in this product:

LPEG

Use of any of this software is governed by the terms of the license below:

Copyright © 2008 Lua.org, PUC-Rio.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR

```

A.63. md5 (Message-Digest Algorithm 5) License

The following software may be included in this product:

```
md5 (Message-Digest Algorithm 5)

This code implements the MD5 message-digest algorithm.
The algorithm is due to Ron Rivest. This code was
written by Colin Plumb in 1993, no copyright is claimed.
This code is in the public domain; do with it what you wish.

Equivalent code is available from RSA Data Security, Inc.
This code has been tested against that, and is equivalent,
except that you don't need to include two pages of legalese
with every copy.

The code has been modified by Mikael Ronstroem to handle
calculating a hash value of a key that is always a multiple
of 4 bytes long. Word 0 of the calculated 4-word hash value
is returned as the hash value.
```

A.64. nt_servc (Windows NT Service class library) License

The following software may be included in this product:

nt_servc (Windows NT Service class library)

```
Windows NT Service class library
Copyright Abandoned 1998 Irena Pancirov - Irnet Snc
This file is public domain and comes with NO WARRANTY of any kind
```

A.65. OGNL (Object-Graph Navigation Language) License

```
The following software may be included in this product:

OGNL (Object-Graph Navigation Language)

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

A.68. PCRE License

The following software may be included in this product:

PCRE (Perl Compatible Regular Expressions) Library

PCRE LICENCE

PCRE is a library of functions to support regular expressions whose syntax and semantics are as close as possible to those of the Perl 5 language.

Release 7 of PCRE is distributed under the terms of the "BSD" licence, as specified below. The documentation for PCRE, supplied in the "doc" directory, is distributed under the same terms as the software itself.

The basic library functions are written in C and are freestanding. Also included in the distribution is a set of C++ wrapper functions.

THE BASIC LIBRARY FUNCTIONS

Written by: Philip Hazel
Email local part: phil0
Email domain: cam.ac.uk

University of Cambridge Computing Service,
Cambridge, England. Phone: +44 1223 334714.

A.71. Python License

The following software may be included in this product:

Python Programming Language

This is the official license for the Python 2.7 release:

A. HISTORY OF THE SOFTWARE

Python was created in the early 1990s by Guido van Rossum at Stichting Mathematisch Centrum (CWI, see <http://www.cwi.nl>) in the Netherlands as a successor of a language called ABC. Guido remains Python's principal author, although it includes many contributions from others.

In 1995, Guido continued his work on Python at the Corporation for National Research Initiatives (CNRI, see <http://www.cnri.reston.va.us>) in Reston, Virginia where he released several versions of the software.

In May 2000, Guido and the Python core development team moved to BeOpen.com to form the BeOpen PythonLabs team. In October of the same year, the PythonLabs team moved to Digital Creations (now Zope Corporation, see <http://www.zope.com>). In 2001, the Python Software Foundation (PSF, see <http://www.python.org/psf/>) was formed, a non-profit organization created specifically to own Python-related Intellectual Property. Zope Corporation is a sponsoring member of the PSF.

All Python releases are Open Source (see <http://www.opensource.org> for the Open Source Definition). Historically, most, but not all, Python releases have also been GPL-compatible; the table below summarizes the various releases.

Release	Derived from	Year	Owner	GPL-compatible? (1)
0.9.0 thru 1.2		1991-1995	CWI	yes
1.3 thru 1.5.2	1.2	1995-1999	CNRI	yes
1.6	1.5.2	2000	CNRI	no
2.0	1.6	2000	BeOpen.com	no
1.6.1	1.6	2001	CNRI	yes (2)
2.1	2.0+1.6.1	2001	PSF	no
2.0.1	2.0+1.6.1	2001	PSF	yes
2.1.1	2.1+2.0.1	2001	PSF	yes
2.2	2.1.1	2001	PSF	yes
2.1.2	2.1.1	2002	PSF	yes
2.1.3	2.1.2	2002	PSF	yes
2.2.1	2.2	2002	PSF	yes
2.2.2	2.2.1	2002	PSF	yes
2.2.3	2.2.2	2003	PSF	yes
2.3	2.2.2	2002-2003	PSF	yes
2.3.1	2.3	2002-2003	PSF	yes
2.3.2	2.3.1	2002-2003	PSF	yes
2.3.3	2.3.2	2002-2003	PSF	yes
2.3.4	2.3.3	2004	PSF	yes
2.3.5	2.3.4	2005	PSF	yes
2.4	2.3	2004	PSF	yes
2.4.1	2.4	2005	PSF	yes
2.4.2	2.4.1	2005	PSF	yes
2.4.3	2.4.2	2006	PSF	yes
2.5	2.4	2006	PSF	yes
2.5.1	2.5	2007	PSF	yes
2.5.2	2.5.1	2008	PSF	yes
2.5.3	2.5.2	2008	PSF	yes
2.6	2.5	2008	PSF	yes
2.6.1	2.6	2008	PSF	yes
2.6.2	2.6.1	2009	PSF	yes
2.6.3	2.6.2	2009	PSF	yes
2.6.4	2.6.3	2010	PSF	yes
2.7	2.6	2010	PSF	yes

Footnotes:

- (1) GPL-compatible doesn't mean that we're distributing Python under the GPL. All Python licenses, unlike the GPL, let you distribute a modified version without making your changes open source. The GPL-compatible licenses make it possible to combine Python with other software that is released under the GPL; the others don't.

(2) According to Richard Stallman, 1.6.1 is not GPL-compatible, because its license has a choice of law clause. According to CNRI, however, Stallman's lawyer has told CNRI's lawyer that 1.6.1 is "not incompatible" with the GPL.

Thanks to the many outside volunteers who have worked under Guido's direction to make these releases possible.

B. TERMS AND CONDITIONS FOR ACCESSING OR OTHERWISE USING PYTHON

PYTHON SOFTWARE FOUNDATION LICENSE VERSION 2

1. This LICENSE AGREEMENT is between the Python Software Foundation ("PSF"), and the Individual or Organization ("Licensee") accessing and otherwise using this software ("Python") in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, PSF hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python alone or in any derivative version, provided, however, that PSF's License Agreement and PSF's notice of copyright, i.e., "Copyright (c) 2001, 2002, 2003, 2004, 2005, 2006 Python Software Foundation; All Rights Reserved" are retained in Python alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates Python or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python.

4. PSF is making Python available to Licensee on an "AS IS" basis. PSF MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, PSF MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. PSF SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between PSF and Licensee. This License Agreement does not grant permission to use PSF trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using Python, Licensee agrees to be bound by the terms and conditions of this License Agreement.

BEOPEN.COM LICENSE AGREEMENT FOR PYTHON 2.0

BEOPEN PYTHON OPEN SOURCE LICENSE AGREEMENT VERSION 1

1. This LICENSE AGREEMENT is between BeOpen.com ("BeOpen"), having an office at 160 Saratoga Avenue, Santa Clara, CA 95051, and the Individual or Organization ("Licensee") accessing and otherwise using this software in source or binary form and its associated documentation ("the Software").

2. Subject to the terms and conditions of this BeOpen Python License Agreement, BeOpen hereby grants Licensee a non-exclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use the Software alone or in any derivative version, provided, however, that the BeOpen Python License is retained in the Software, alone or in any derivative version prepared by Licensee.

3. BeOpen is making the Software available to Licensee on an "AS IS" basis. BEOPEN MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, BEOPEN MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF THE SOFTWARE WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

4. BEOPEN SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF THE SOFTWARE FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF USING, MODIFYING OR DISTRIBUTING THE SOFTWARE, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

5. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

6. This License Agreement shall be governed by and interpreted in all respects by the law of the State of California, excluding conflict of law provisions. Nothing in this License Agreement shall be deemed to

create any relationship of agency, partnership, or joint venture between BeOpen and Licensee. This License Agreement does not grant permission to use BeOpen trademarks or trade names in a trademark sense to endorse or promote products or services of Licensee, or any third party. As an exception, the "BeOpen Python" logos available at <http://www.pythonlyns.com/logos.html> may be used according to the permissions granted on that web page.

7. By copying, installing or otherwise using the software, Licensee agrees to be bound by the terms and conditions of this License Agreement.

CNRI LICENSE AGREEMENT FOR PYTHON 1.6.1

1. This LICENSE AGREEMENT is between the Corporation for National Research Initiatives, having an office at 1895 Preston White Drive, Reston, VA 20191 ("CNRI"), and the Individual or Organization ("Licensee") accessing and otherwise using Python 1.6.1 software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, CNRI hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python 1.6.1 alone or in any derivative version, provided, however, that CNRI's License Agreement and CNRI's notice of copyright, i.e., "Copyright (c) 1995-2001 Corporation for National Research Initiatives; All Rights Reserved" are retained in Python 1.6.1 alone or in any derivative version prepared by Licensee. Alternately, in lieu of CNRI's License Agreement, Licensee may substitute the following text (omitting the quotes): "Python 1.6.1 is made available subject to the terms and conditions in CNRI's License Agreement. This Agreement together with Python 1.6.1 may be located on the Internet using the following unique, persistent identifier (known as a handle): 1895.22/1013. This Agreement may also be obtained from a proxy server on the Internet using the following URL: <http://hdl.handle.net/1895.22/1013>".

3. In the event Licensee prepares a derivative work that is based on or incorporates Python 1.6.1 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python 1.6.1.

4. CNRI is making Python 1.6.1 available to Licensee on an "AS IS" basis. CNRI MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, CNRI MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON 1.6.1 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. CNRI SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON 1.6.1 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON 1.6.1, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. This License Agreement shall be governed by the federal intellectual property law of the United States, including without limitation the federal copyright law, and, to the extent such U.S. federal law does not apply, by the law of the Commonwealth of Virginia, excluding Virginia's conflict of law provisions. Notwithstanding the foregoing, with regard to derivative works based on Python 1.6.1 that incorporate non-separable material that was previously distributed under the GNU General Public License (GPL), the law of the Commonwealth of Virginia shall govern this License Agreement only as to issues arising under or with respect to Paragraphs 4, 5, and 7 of this License Agreement. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between CNRI and Licensee. This License Agreement does not grant permission to use CNRI trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By clicking on the "ACCEPT" button where indicated, or by copying, installing or otherwise using Python 1.6.1, Licensee agrees to be bound by the terms and conditions of this License Agreement.

ACCEPT

CWI LICENSE AGREEMENT FOR PYTHON 0.9.0 THROUGH 1.2

Copyright (c) 1991 - 1995, Stichting Mathematisch Centrum Amsterdam, The Netherlands. All rights reserved.

Permission to use, copy, modify, and distribute this software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appear in all copies and that both that copyright notice and this permission notice appear in supporting documentation, and that the name of Stichting Mathematisch Centrum or CWI not be used in advertising or publicity pertaining to distribution of the software without specific, written prior

permission.

Appendix B. MySQL 5.5 Frequently Asked Questions

B.1. MySQL 5.5 FAQ: General

Questions

- [B.1.1:](#) Which version of MySQL is production-ready (GA)?
- [B.1.2:](#) What is the state of development (non-GA) versions?
- [B.1.3:](#) Can MySQL 5.5 do subqueries?
- [B.1.4:](#) Can MySQL 5.5 perform multiple-table inserts, updates, and deletes?
- [B.1.5:](#) Does MySQL 5.5 have a Query Cache? Does it work on Server, Instance or Database?
- [B.1.6:](#) Does MySQL 5.5 have Sequences?
- [B.1.7:](#) Does MySQL 5.5 have a `NOW()` function with fractions of seconds?
- [B.1.8:](#) Does MySQL 5.5 work with multi-core processors?
- [B.1.9:](#) Why do I see multiple processes for `mysqld`?
- [B.1.10:](#) Have there been any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?
- [B.1.11:](#) Can MySQL 5.5 perform ACID transactions?

Questions and Answers

B.1.1: Which version of MySQL is production-ready (GA)?

Currently, both MySQL 5.0 and MySQL 5.1 are supported for production use.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008.

B.1.2: What is the state of development (non-GA) versions?

MySQL follows a milestone release model that introduces pre-production-quality features and stabilizes them to release quality (see http://forge.mysql.com/wiki/Development_Cycle). This process then repeats, so releases cycle between pre-production and release quality status. Please check the change logs to identify the status of a given release.

MySQL 5.4 was a development series. Work on this series has ceased.

MySQL 5.5 is being actively developed using the milestone release methodology described above.

MySQL 5.6 is being actively developed using the milestone release methodology described above.

MySQL 6.0 was a development series. Work on this series has ceased.

B.1.3: Can MySQL 5.5 do subqueries?

Yes. See [Section 12.2.10, “Subquery Syntax”](#).

B.1.4: Can MySQL 5.5 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 12.2.11, “UPDATE Syntax”](#); for that required to perform multiple-table deletes, see [Section 12.2.2, “DELETE Syntax”](#).

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN ... END` block. See [Section 19.3, “Using Triggers”](#).

B.1.5: Does MySQL 5.5 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 7.9.3, “The MySQL Query Cache”](#).

B.1.6: Does MySQL 5.5 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.5 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

B.1.7: Does MySQL 5.5 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See [Section 10.3.2, “The TIME Type”](#).

B.1.8: Does MySQL 5.5 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

B.1.9: Why do I see multiple processes for `mysqld`?

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

B.1.10: Have there been any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in `InnoDB` has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

B.1.11: Can MySQL 5.5 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

B.2. MySQL 5.5 FAQ: Storage Engines

Questions

- [B.2.1: Where can I obtain complete documentation for MySQL storage engines?](#)
- [B.2.2: Are there any new storage engines in MySQL 5.5?](#)
- [B.2.3: Have any storage engines been removed in MySQL 5.5?](#)
- [B.2.4: What are the unique benefits of the `ARCHIVE` storage engine?](#)
- [B.2.5: Do the new features in MySQL 5.5 apply to all storage engines?](#)

Questions and Answers

B.2.1: Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 13, Storage Engines](#). That chapter contains information about all MySQL storage engines except for the `NDB` storage engine used for MySQL Cluster; `NDB` is covered in [MySQL Cluster NDB 6.X/7.X](#).

B.2.2: Are there any new storage engines in MySQL 5.5?

No, but the `InnoDB Plugin` is the built-in version of the `InnoDB` storage engine.

B.2.3: Have any storage engines been removed in MySQL 5.5?

No.

B.2.4: What are the unique benefits of the `ARCHIVE` storage engine?

The `ARCHIVE` storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See [Section 13.12, “The `ARCHIVE` Storage Engine”](#), for details.

B.2.5: Do the new features in MySQL 5.5 apply to all storage engines?

The general new features such as views, stored procedures, triggers, `INFORMATION_SCHEMA`, precision math (`DECIMAL` column type), and the `BIT` column type, apply to all storage engines. There are also additions and changes for specific storage engines.

B.3. MySQL 5.5 FAQ: Server SQL Mode

Questions

- [B.3.1: What are server SQL modes?](#)
- [B.3.2: How many server SQL modes are there?](#)
- [B.3.3: How do you determine the server SQL mode?](#)
- [B.3.4: Is the mode dependent on the database or connection?](#)
- [B.3.5: Can the rules for strict mode be extended?](#)
- [B.3.6: Does strict mode impact performance?](#)
- [B.3.7: What is the default server SQL mode when My SQL 5.5 is installed?](#)

Questions and Answers

B.3.1: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.7, “Server SQL Modes”](#).

B.3.2: How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.7, “Server SQL Modes”](#), for a complete list of available modes.

B.3.3: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

B.3.4: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

B.3.5: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See [Section 5.1.7, “Server SQL Modes”](#), for more information.

B.3.6: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However—if you do require it—strict mode can provide such validation.

B.3.7: What is the default server SQL mode when My SQL 5.5 is installed?

By default, no special modes are enabled. See [Section 5.1.7, “Server SQL Modes”](#), for information about all available modes and MySQL's default behavior.

B.4. MySQL 5.5 FAQ: Stored Procedures and Functions

Questions

- [B.4.1:](#) Does MySQL 5.5 support stored procedures and functions?
- [B.4.2:](#) Where can I find documentation for MySQL stored procedures and stored functions?
- [B.4.3:](#) Is there a discussion forum for MySQL stored procedures?
- [B.4.4:](#) Where can I find the ANSI SQL 2003 specification for stored procedures?
- [B.4.5:](#) How do you manage stored routines?
- [B.4.6:](#) Is there a way to view all stored procedures and stored functions in a given database?
- [B.4.7:](#) Where are stored procedures stored?
- [B.4.8:](#) Is it possible to group stored procedures or stored functions into packages?
- [B.4.9:](#) Can a stored procedure call another stored procedure?
- [B.4.10:](#) Can a stored procedure call a trigger?
- [B.4.11:](#) Can a stored procedure access tables?
- [B.4.12:](#) Do stored procedures have a statement for raising application errors?
- [B.4.13:](#) Do stored procedures provide exception handling?
- [B.4.14:](#) Can MySQL 5.5 stored routines return result sets?
- [B.4.15:](#) Is `WITH RECOMPILE` supported for stored procedures?
- [B.4.16:](#) Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?
- [B.4.17:](#) Can I pass an array as input to a stored procedure?
- [B.4.18:](#) Can I pass a cursor as an `IN` parameter to a stored procedure?
- [B.4.19:](#) Can I return a cursor as an `OUT` parameter from a stored procedure?
- [B.4.20:](#) Can I print out a variable's value within a stored routine for debugging purposes?
- [B.4.21:](#) Can I commit or roll back transactions inside a stored procedure?
- [B.4.22:](#) Do MySQL 5.5 stored procedures and functions work with replication?
- [B.4.23:](#) Are stored procedures and functions created on a master server replicated to a slave?
- [B.4.24:](#) How are actions that take place inside stored procedures and functions replicated?
- [B.4.25:](#) Are there special security requirements for using stored procedures and functions together with replication?
- [B.4.26:](#) What limitations exist for replicating stored procedure and function actions?
- [B.4.27:](#) Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- [B.4.28:](#) What is being done to correct the aforementioned limitations?

Questions and Answers

B.4.1: Does MySQL 5.5 support stored procedures and functions?

Yes. MySQL 5.5 supports two types of stored routines—stored procedures and stored functions.

B.4.2: Where can I find documentation for MySQL stored procedures and stored functions?

See [Section 19.2, “Using Stored Routines \(Procedures and Functions\)”](#).

B.4.3: Is there a discussion forum for MySQL stored procedures?

Yes. See <http://forums.mysql.com/list.php?98>.

B.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including coverage of stored procedures.

B.4.5: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 20.14, “The INFORMATION_SCHEMA ROUTINES Table”](#)).

B.4.6: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME  
  FROM INFORMATION_SCHEMA.ROUTINES  
 WHERE ROUTINE_SCHEMA = 'dbname';
```

For more information, see [Section 20.14, “The INFORMATION_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 12.4.5.11, “SHOW CREATE PROCEDURE Syntax”](#), for more information.

B.4.7: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 12.4.5.11, “SHOW CREATE PROCEDURE Syntax”](#), for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database—see [Section 20.14, “The INFORMATION_SCHEMA ROUTINES Table”](#), for information about this table.

B.4.8: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.5.

B.4.9: Can a stored procedure call another stored procedure?

Yes.

B.4.10: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

B.4.11: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

B.4.12: Do stored procedures have a statement for raising application errors?

Yes. MySQL 5.5 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See [Section 12.7.8, “SIGNAL and RESIGNAL”](#).

B.4.13: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 12.7.4.2, “DECLARE for Handlers”](#), for details.

B.4.14: Can MySQL 5.5 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

B.4.15: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.5.

B.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.5.

B.4.17: Can I pass an array as input to a stored procedure?

Not in MySQL 5.5.

B.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.5, cursors are available inside stored procedures only.

B.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.5, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 12.2.9, “SELECT Syntax”](#).

B.4.20: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that—for instance—in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

B.4.21: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

B.4.22: Do MySQL 5.5 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 19.7, “Binary Logging of Stored Programs”](#).

B.4.23: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

B.4.24: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

B.4.25: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

B.4.26: What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

B.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

B.4.28: What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

Mixed replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid, “smart” form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 17.1.2, “Replication Formats”](#).

B.5. MySQL 5.5 FAQ: Triggers

Questions

- [B.5.1:](#) Where can I find the documentation for MySQL 5.5 triggers?
- [B.5.2:](#) Is there a discussion forum for MySQL Triggers?
- [B.5.3:](#) Does MySQL 5.5 have statement-level or row-level triggers?
- [B.5.4:](#) Are there any default triggers?
- [B.5.5:](#) How are triggers managed in MySQL?
- [B.5.6:](#) Is there a way to view all triggers in a given database?
- [B.5.7:](#) Where are triggers stored?
- [B.5.8:](#) Can a trigger call a stored procedure?
- [B.5.9:](#) Can triggers access tables?
- [B.5.10:](#) Can triggers call an external application through a UDF?
- [B.5.11:](#) Is it possible for a trigger to update tables on a remote server?
- [B.5.12:](#) Do triggers work with replication?
- [B.5.13:](#) How are actions carried out through triggers on a master replicated to a slave?

Questions and Answers

B.5.1: Where can I find the documentation for MySQL 5.5 triggers?

See [Section 19.3, “Using Triggers”](#).

B.5.2: Is there a discussion forum for MySQL Triggers?

Yes. It is available at <http://forums.mysql.com/list.php?99>.

B.5.3: Does MySQL 5.5 have statement-level or row-level triggers?

In MySQL 5.5, all triggers are `FOR EACH ROW`—that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.5 does not support triggers using `FOR EACH STATEMENT`.

B.5.4: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

B.5.5: How are triggers managed in MySQL?

In MySQL 5.5, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 12.1.15, “CREATE TRIGGER Syntax”](#), and [Section 12.1.24, “DROP TRIGGER Syntax”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 20.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

B.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
  FROM INFORMATION_SCHEMA.TRIGGERS
 WHERE TRIGGER_SCHEMA= 'dbname';
```

For more information about this table, see [Section 20.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 12.4.5.39, “SHOW TRIGGERS Syntax”](#).

B.5.7: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

B.5.8: Can a trigger call a stored procedure?

Yes.

B.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

B.5.10: Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF available at MySQL Forge here: <http://forge.mysql.com/projects/project.php?id=211>

B.5.11: Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 13.11, “The FEDERATED Storage Engine”](#)).

B.5.12: Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based replication available in all versions of MySQL, or the row-based replication format introduced in MySQL 5.1.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see [Section 17.4.1.29, “Replication and Triggers”](#).

B.5.13: How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

Statement-based replication. First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.

3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

Row-based replication. When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and—in addition—the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 17.4.1.29, “Replication and Triggers”](#).

B.6. MySQL 5.5 FAQ: Views

Questions

- [B.6.1:](#) Where can I find documentation covering MySQL Views?
- [B.6.2:](#) Is there a discussion forum for MySQL Views?
- [B.6.3:](#) What happens to a view if an underlying table is dropped or renamed?
- [B.6.4:](#) Does MySQL 5.5 have table snapshots?
- [B.6.5:](#) Does MySQL 5.5 have materialized views?
- [B.6.6:](#) Can you insert into views that are based on joins?

Questions and Answers

B.6.1: Where can I find documentation covering MySQL Views?

See [Section 19.5, “Using Views”](#).

B.6.2: Is there a discussion forum for MySQL Views?

Yes. See <http://forums.mysql.com/list.php?100>

B.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 12.4.2.2, “CHECK TABLE Syntax”](#).)

B.6.4: Does MySQL 5.5 have table snapshots?

No.

B.6.5: Does MySQL 5.5 have materialized views?

No.

B.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

B.7. MySQL 5.5 FAQ: INFORMATION_SCHEMA

Questions

- **B.7.1:** Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- **B.7.2:** Is there a discussion forum for `INFORMATION_SCHEMA`?
- **B.7.3:** Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- **B.7.4:** What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?
- **B.7.5:** Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

Questions and Answers

B.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 20, `INFORMATION_SCHEMA` Tables](#)

B.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See <http://forums.mysql.com/list.php?101>.

B.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

B.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

B.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data.*

B.8. MySQL 5.5 FAQ: Migration

Questions

- **B.8.1:** Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.5?
- **B.8.2:** How has storage engine (table type) support changed in MySQL 5.5 from previous versions?

Questions and Answers

B.8.1: Where can I find information on how to migrate from MySQL 5.1 to MySQL 5.5?

For detailed upgrade information, see [Section 2.11.1, “Upgrading MySQL”](#). Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will save you time and trouble—if you encounter problems during the upgrade, their origin will be easier to identify, either by you or—if you have a MySQL Enterprise subscription—by MySQL support.

B.8.2: How has storage engine (table type) support changed in MySQL 5.5 from previous versions?

Storage engine support has changed as follows:

- Support for `ISAM` tables was removed in MySQL 5.0 and you should now use the `MyISAM` storage engine in place of `ISAM`. To convert a table `tblname` from `ISAM` to `MyISAM`, simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal RAID for `MyISAM` tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file sys-

tems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as [MERGE](#) tables and views.

- The [VARCHAR](#) column type now retains trailing spaces in all storage engines.
- [MEMORY](#) tables (formerly known as [HEAP](#) tables) can also contain [VARCHAR](#) columns.

B.9. MySQL 5.5 FAQ: Security

Questions

- [B.9.1:](#) Where can I find documentation that addresses security issues for MySQL?
- [B.9.2:](#) Does MySQL 5.5 have native support for SSL?
- [B.9.3:](#) Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?
- [B.9.4:](#) Does MySQL 5.5 have built-in authentication against LDAP directories?
- [B.9.5:](#) Does MySQL 5.5 include support for Roles Based Access Control (RBAC)?

Questions and Answers

B.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Section 5.3, “General Security Issues”](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 5.3.1, “General Security Guidelines”](#).
- [Section 5.3.3, “Making MySQL Secure Against Attackers”](#).
- [Section C.5.4.1, “How to Reset the Root Password”](#).
- [Section 5.3.6, “How to Run MySQL as a Normal User”](#).
- [Section 23.3.2.6, “User-Defined Function Security Precautions”](#).
- [Section 5.3.4, “Security-Related mysqld Options”](#).
- [Section 5.3.5, “Security Issues with LOAD DATA LOCAL”](#).
- [Section 2.10, “Postinstallation Setup and Testing”](#).
- [Section 5.5.8.1, “Basic SSL Concepts”](#).

B.9.2: Does MySQL 5.5 have native support for SSL?

Most 5.5 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it is still quite new and does not compile on all platforms yet. See [Section 5.5.8, “Using SSL for Secure Connections”](#).

You can also tunnel a connection using SSH, if (for example) the client application doesn't support SSL connections. For an example, see [Section 5.5.9, “Connecting to MySQL Remotely from Windows with SSH”](#).

B.9.3: Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.5 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See [Section 5.5.8, “Using SSL for Secure Connections”](#), for a complete listing of supported and unsupported platforms.

B.9.4: Does MySQL 5.5 have built-in authentication against LDAP directories?

Not at this time.

B.9.5: Does MySQL 5.5 include support for Roles Based Access Control (RBAC)?

Not at this time.

B.10. MySQL 5.5 FAQ: MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the [NDBCLUSTER](#) storage engine.

Questions

- [B.10.1:](#) Which versions of the MySQL software support Cluster? Do I have to compile from source?

Questions and Answers

[B.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?](#)

MySQL Cluster is not supported in MySQL Server 5.5 releases. Instead, MySQL Cluster is released as a separate product, available as MySQL Cluster NDB 6.3 and MySQL Cluster NDB 7.0. You should use one of these for new deployments, and plan to upgrade to one of them if you are using a previous version of MySQL with clustering support. For an overview of improvements in MySQL Cluster NDB 6.2 and 6.3, see [MySQL Cluster Development in MySQL Cluster NDB 6.3](#), and [MySQL Cluster Development in MySQL Cluster NDB 7.0](#).

For answers to frequently asked questions about MySQL Cluster, see [MySQL 5.1 FAQ: MySQL Cluster](#). For detailed information about deploying and using MySQL Cluster, see [MySQL Cluster NDB 6.X/7.X](#).

B.11. MySQL 5.5 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- [B.11.1:](#) What CJK character sets are available in MySQL?
- [B.11.2:](#) I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?
- [B.11.3:](#) What problems should I be aware of when working with the Big5 Chinese character set?
- [B.11.4:](#) Why do Japanese character set conversions fail?
- [B.11.5:](#) What should I do if I want to convert SJIS `81CA` to `cp932`?
- [B.11.6:](#) How does MySQL represent the Yen (`¥`) sign?
- [B.11.7:](#) Do MySQL plan to make a separate character set where `5C` is the Yen sign, as at least one other major DBMS does?
- [B.11.8:](#) Of what issues should I be aware when working with Korean character sets in MySQL?
- [B.11.9:](#) Why do I get `DATA TRUNCATED` error messages?
- [B.11.10:](#) Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?
- [B.11.11:](#) I've upgraded to MySQL 5.5. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?
- [B.11.12:](#) Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?
- [B.11.13:](#) How do I know whether character `X` is available in all character sets?
- [B.11.14:](#) Why don't CJK strings sort correctly in Unicode? (I)
- [B.11.15:](#) Why don't CJK strings sort correctly in Unicode? (II)
- [B.11.16:](#) Why are my supplementary characters rejected by MySQL?

- [B.11.17](#): Shouldn't it be “CJKV”?
- [B.11.18](#): Does MySQL allow CJK characters to be used in database and table names?
- [B.11.19](#): Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- [B.11.20](#): Where can I get help with CJK and related issues in MySQL?

Questions and Answers

B.11.1: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `eucjpms` character set was not supported prior to MySQL 5.0.3 (see [Changes in MySQL 5.0.3](#)). However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
->   FROM INFORMATION_SCHEMA.CHARACTER_SETS
->  WHERE DESCRIPTION LIKE '%Chinese%'
->    OR DESCRIPTION LIKE '%Japanese%'
->    OR DESCRIPTION LIKE '%Korean%'
->   ORDER BY CHARACTER_SET_NAME;
+-----+-----+
| CHARACTER_SET_NAME | DESCRIPTION |
+-----+-----+
| big5              | Big5 Traditional Chinese
| cp932             | SJIS for Windows Japanese
| eucjpms           | UJIS for Windows Japanese
| euckr              | EUC-KR Korean
| gb2312            | GB2312 Simplified Chinese
| gbk               | GBK Simplified Chinese
| sjis              | Shift-JIS Japanese
| ujis              | EUC-JP Japanese
+-----+-----+
8 rows in set (0.01 sec)
```

(See [Section 20.9, “The INFORMATION_SCHEMA CHARACTER_SETS Table”](#), for more information.)

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`—but eventually they try to insert a rarer Chinese character and it doesn't work. (See [Bug#16072](#) for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs.

- For a complete listing of the `gb2312` characters, ordered according to the `gb2312_chinese_ci` collation: [gb2312](#)
- MySQL's `gbk` is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0-A6F5`, and `A8BB-A8C0`. For a listing of the differences, see [ht-tp://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h](http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h).
- For a listing of `gbk`/Unicode mappings, see [ht-tp://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT](http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT).
- For MySQL's listing of `gbk` characters, see [gbk](#).

B.11.2: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- Be certain of what MySQL version you are using.

Use the statement `SELECT VERSION()`; to determine this.

- Make sure that the database is actually using the desired character set.

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or—better—yet by using this statement:

```
SELECT character_set_name, collation_name
  FROM information_schema.columns
 WHERE table_schema = your_database_name
   AND table_name = your_table_name
   AND column_name = your_column_name;
```

- Determine the hexadecimal value of the character or characters that are not being displayed correctly.

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
  FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- Make sure that a round trip possible—that is, when you select `literal` (or `_introducer_hexadecimal-value`), you obtain `literal` as a result.

For example, the Japanese *Katakana* character *Pe* (ؘ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ؘ' AS `ؘ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also `ؘ`, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ؘ');`. Then we can determine whether the client encoding is correct.

- Make sure that the problem is not with the browser or other application, rather than with MySQL.

Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysql/charsets/

8 rows in set (0.03 sec)

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpm` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI*

front end or browser not display CJK characters correctly...? for more information.

B.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of [Bug#12476](#)). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+-----+
| big5 |
+-----+
| 嫣   |
+-----+
1 row in set (0.02 sec)
```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for [Bug#13577](#) to be of interest.

B.11.4: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations—that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”)—this is what is always used when the conversion cannot be performed.

B.11.5: What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`. We are considering a change to this behavior.

B.11.6: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `euc`) treat `5C` as a *reverse solidus* (\—also known as a backslash), and others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (\).

B.11.7: Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 6.0.

B.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is \, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is WON SIGN(₩). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
    ->   CONVERT('₩' USING euckr) AS euckr,
    ->   HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ?     | 3F      |
+-----+-----+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: `euckr`.

B.11.9: Why do I get DATA TRUNCATED error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
    ->   (ucs2 CHAR(3) CHARACTER SET ucs2,
    ->   gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character Ⓜ in both columns.

```
mysql> INSERT INTO ch VALUES ('AⓂB','AⓂB');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there is a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message          |
+-----+-----+-----+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| AⓂB | 004116C4C0042 | A?B     | 413F42      |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it is a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The `𣇵` character isn’t in the `gb2312` character set. We described that problem earlier.
3. Admittedly the message is misleading. We didn’t “truncate” in this case, we replaced with a question mark. We’ve had a complaint about this message (See [Bug#9337](#)). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.
4. With `sql_mode=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1.`

B.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check [Section 22.1.4, “Connector/ODBC Configuration”](#). If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See [Section 22.2.5.1, “Connecting to MySQL Using Connector/NET”](#), for more information.

If you are using PHP, try this:

```
<?php
$link = mysql_connect($host, $usr, $pwd);
mysql_select_db($db);

if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as `UTF-8`, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see [Section 22.3.4.4, “Using Character Sets and Unicode”](#).

B.11.11: I've upgraded to MySQL 5.5. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 9.1.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use—however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | latin1 |
| character_set_connection | latin1 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | latin1 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` is used.

B.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `𠂇` requires three bytes, as shown here:

```
+-----+-----+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 '𠂇') |
+-----+-----+
|          1 |          3 |
+-----+-----+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of nonexistent characters. If it is not strict about rejecting bad input, then it

has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary—the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

B.11.13: How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
    (ucs2 CHAR(1) character set ucs2,
     utf8 CHAR(1) character set utf8,
     big5 CHAR(1) character set big5,
     cp932 CHAR(1) character set cp932,
     eucjpm CHAR(1) character set eucjpm,
     euckr CHAR(1) character set euckr,
     gb2312 CHAR(1) character set gb2312,
     gbk CHAR(1) character set gbk,
     sjis CHAR(1) character set sjis,
     ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
    big5=ucs2,
    cp932=ucs2,
    eucjpm=ucs2,
    euckr=ucs2,
    gb2312=ucs2,
    gbk=ucs2,
    sjis=ucs2,
    ujis=ucs2;

/* If there is a conversion problem, UPDATE will produce a warning. */

SELECT hex(ucs2) AS ucs2,
    hex(utf8) AS utf8,
    hex(big5) AS big5,
    hex(cp932) AS cp932,
    hex(eucjpm) AS eucjpm,
    hex(euckr) AS euckr,
    hex(gb2312) AS gb2312,
    hex(gbk) AS gbk,
    hex(sjis) AS sjis,
    hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//
```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(0x30da)//
+-----+
| ucs2 | utf8   | big5  | cp932 | eucjpm | euckr | gb2312 | gbk   | sjis  | ujis  |
+-----+
| 30DA | E3839A | C772  | 8379 | A5DA   | ABDA  | A5DA   | A5DA  | 8379 | A5DA  |
+-----+
1 row in set (0.04 sec)
```

Since none of the column values is `3F`—that is, the question mark character (?)—we know that every conversion worked.

B.11.14: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at <http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt>. This is not the first table you will find by navigating from the unicode.org home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in [Bug#16526](#), illustrated as follows:

```
mysql> CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'), ('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+---+
| s1 |
+---+
| か |
+---+
2 rows in set (0.00 sec)
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+---+-----+
| s1 | HEX(CONVERT(s1 USING ucs2)) |
+---+-----+
| が | 304C |
| か | 304B |
+---+-----+
2 rows in set (0.03 sec)
```

Now we search for `304B` and `304C` in the `4.0.0_allkeys` table, and find these lines:

```
304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QQCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA` or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `が` and `か` correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” isn't enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like `KA/GA` are distinguishable for ordering purposes.

B.11.15: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section B.11, “MySQL 5.5 FAQ: MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
  `s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let's see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
-> FROM INFORMATION_SCHEMA.COLUMNS
-> WHERE COLUMN_NAME = 's1'
-> AND TABLE_NAME = 't';
+-----+-----+-----+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME |
+-----+-----+-----+
| s1          | ucs2              | ucs2_general_ci |
+-----+-----+-----+
1 row in set (0.01 sec)
```

(See [Section 20.3, “The INFORMATION_SCHEMA.COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   |      2 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

B.11.16: Why are my supplementary characters rejected by MySQL?

Before MySQL 6.0.4, MySQL does not support supplementary characters—that is, characters which need more than 3 bytes—for [UTF-8](#). We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in [Bug#12600](#), which we rejected as “not a bug”. With [utf8](#), we must truncate an input string when we encounter bytes that we don’t understand. Otherwise, we wouldn’t know how long the bad multi-byte character is.

One possible workaround is to use [ucs2](#) instead of [utf8](#), in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to [BLOB](#) or [BINARY](#), which perform no validity checking.

As of MySQL 6.0.4, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: [utf16](#), [utf32](#), and 4-byte [utf8](#). These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

B.11.17: Shouldn’t it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

[Bug#4745](#) is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

B.11.18: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named [楮](#) on a server whose operating system does not support CJK in directory names, MySQL creates a directory named [@0w@00a5@00ae](#), which is just a fancy way of encoding [E6A5AE](#)—that is, the Unicode hexadeciml representation for the [楮](#) character. However, if you run a [SHOW DATABASES](#) statement, you can see that the database is listed as [楮](#).

B.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at <http://dev.mysql.com/doc/>. The Japanese translation of the MySQL 4.1 manual can be downloaded from <http://dev.mysql.com/doc/>.

B.11.20: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <http://dev.mysql.com/user-groups/>.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

Tel: +81(0)3-5326-3133
Fax: +81(0)3-5326-3001
Email: dsaito@mysql.com

- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). We are also in the process of adding foreign-language forums at <http://forums.mysql.com/>.

B.12. MySQL 5.5 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 22.9.11, “Common Questions and Problems When Using the C API”](#)
- [Section 22.10.6, “Common Problems with MySQL and PHP”](#)
- [Section 22.1.7, “Connector/ODBC Notes and Tips”](#)
- [Section 22.2.5, “Connector/.NET Programming”](#)
- [Section 22.3.5, “Connector/J Notes and Tips”](#)

- [Section 22.4.6, “Connector/MXJ Notes and Tips”](#)

B.13. MySQL 5.5 FAQ: Replication

For answers to common queries and question regarding Replication within MySQL, see [Section 17.4.4, “Replication FAQ”](#).

B.14. MySQL 5.5 FAQ: MySQL, DRBD, and Heartbeat

B.14.1. Distributed Replicated Block Device (DRBD)

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

- [B.14.1.1: What is DRBD?](#)
- [B.14.1.2: What are “Block Devices”?](#)
- [B.14.1.3: How is DRBD licensed?](#)
- [B.14.1.4: Where can I download DRBD?](#)
- [B.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?](#)
- [B.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?](#)

Questions and Answers

B.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by [LINBIT](#).

B.14.1.2: What are “Block Devices”?

A *block device* is the type of device used to represent storage in the Linux Kernel. All physical disk devices present a block device interface. Additionally, virtual disk systems like LVM or DRBD present a block device interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

B.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

B.14.1.4: Where can I download DRBD?

Please see <http://www.drbd.org/download/packages/>.

B.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see <http://lists.linbit.com/>.

B.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit <http://mysql.com/drbd/>.

B.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

- [B.14.2.1](#): How is Linux Heartbeat licensed?
- [B.14.2.2](#): Where can I download Linux Heartbeat?
- [B.14.2.3](#): If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Questions and Answers

B.14.2.1: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

B.14.2.2: Where can I download Linux Heartbeat?

Please see <http://linux-ha.org/download/index.html>.

B.14.2.3: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to <http://www.linux-ha.org/ClusterResourceManager/BugReports>.

B.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

- [B.14.3.1](#): Is an Active/Active option available for MySQL with DRBD?
- [B.14.3.2](#): What MySQL storage engines are supported with DRBD?
- [B.14.3.3](#): How long does a failover take?
- [B.14.3.4](#): How long does it take to resynchronize data after a failure?
- [B.14.3.5](#): Are there any situations where you shouldn't use DRBD?
- [B.14.3.6](#): Are there any limitations to DRBD?
- [B.14.3.7](#): Where can I find more information on sample architectures?

Questions and Answers

B.14.3.1: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

B.14.3.2: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

B.14.3.3: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

B.14.3.4: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

B.14.3.5: Are there any situations where you shouldn't use DRBD?

See [When Not To Use DRBD](#).

B.14.3.6: Are there any limitations to DRBD?

See [DRBD limitations \(or are they?\)](#).

B.14.3.7: Where can I find more information on sample architectures?

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see [DRBD User's Guide](#).

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see [DRBD User's Guide](#).

B.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- [B.14.4.1:](#) What is the difference between MySQL Cluster and DRBD?
- [B.14.4.2:](#) What is the difference between MySQL Replication and DRBD?
- [B.14.4.3:](#) How can I combine MySQL Replication scale-out with DRBD?

Questions and Answers

B.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the “stack”, at the disk I/O level. For a comparison of various high availability features between these two options, please refer to [Chapter 14, High Availability and Scalability](#).

B.14.4.2: What is the difference between MySQL Replication and DRBD?

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, [Chapter 14, High Availability and Scalability](#).

B.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL “read-slaves” off of the Active-Master MySQL Server. Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure B.1. Active-Master MySQL Server

B.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- [B.14.5.1:](#) Can XFS be used with DRBD?

Questions and Answers

B.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

B.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- [B.14.6.1:](#) Can I use DRBD on top of LVM?
- [B.14.6.2:](#) Can I use LVM on top of DRBD?
- [B.14.6.3:](#) Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

Questions and Answers

B.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

B.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your dis-

tribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

B.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

B.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- [B.14.7.1:](#) Can I use DRBD with OpenVZ?
- [B.14.7.2:](#) Can I use DRBD with Xen or KVM?

Questions and Answers

B.14.7.1: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

B.14.7.2: Can I use DRBD with Xen or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (<http://www.linbit.com>).

B.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- [B.14.8.1:](#) Can I encrypt/compress the exchanged data?
- [B.14.8.2:](#) Does DRBD do mutual node authentication?

Questions and Answers

B.14.8.1: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

B.14.8.2: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

B.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- [B.14.9.1:](#) What other packages besides DRBD are required?
- [B.14.9.2:](#) How many machines are required to set up DRBD?
- [B.14.9.3:](#) Does DRBD only run on Linux?

Questions and Answers

B.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for `glibc` and your favorite shell. When

compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselinux-devel
- perl-DBI
- libnet

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

B.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

B.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

B.14.10. DRBD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- [B.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?](#)
- [B.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?](#)

- [B.14.10.3](#): Are pre-built binaries or RPMs available?
- [B.14.10.4](#): Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- [B.14.10.5](#): Is there a dedicated discussion forum for MySQL High-Availability?
- [B.14.10.6](#): Where can I get more information about MySQL for DRBD?

Questions and Answers

B.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: <http://www.mysql.com/consulting/packaged/scaleout.html>.

B.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: <http://mysql.com/products/enterprise/features.html>.

For the list of supported Linux distributions, please see: <http://www.mysql.com/support/supportedplatforms/enterprise.html>.

Note

DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HPUX, AIX, FreeBSD, or other non-Linux platforms.

B.14.10.3: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: <http://mysql.com/products/enterprise/features.html>.

B.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

For MySQL-specific DRBD documentation, see [Section 14.1, “Using MySQL with DRBD”](#).

For general DRBD documentation, see [DRBD User’s Guide](#).

B.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, <http://forums.mysql.com/list.php?144>.

B.14.10.6: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: <http://www.mysql.com/products/enterprise/drbd.html>.

Appendix C. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

C.1. Sources of Error Information

There are several sources of error information in MySQL:

- Each SQL statement executed results in an error code, an SQLSTATE value, and an error message, as described in [Section C.2, “Types of Error Values”](#). These errors are returned from the server side; see [Section C.3, “Server Error Codes and Messages”](#).
- Errors can occur on the client side, usually involving problems communicating with the server; see [Section C.4, “Client Error Codes and Messages”](#).
- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` and `error_count` system variables provide counts of the number of warnings and errors.
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on the slave side.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an InnoDB table fails.
- The `perror` program provides information from the command line about error numbers. See [Section 4.8.1, “perror — Explain Error Codes”](#).

Descriptions of server and client errors are provided later in this Appendix. For information about errors related to InnoDB, see [Section 13.6.13, “InnoDB Error Handling”](#).

C.2. Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.
- An SQLSTATE value. The value is a five-character string (for example, '`42S02`'). The values are specified by ANSI SQL and ODBC and are more standardized.

A message string that provides a textual description of the error is also available.

When an error occurs, you can access the MySQL error code, the SQLSTATE value, and the message string using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in [Section 22.9, “MySQL C API”](#).

The first two characters of an SQLSTATE value indicate the error class:

- '`00`' indicates success.
- '`01`' indicates a warning.
- '`02`' indicates “not found.” These values are relevant only within the context of cursors and are used to control what happens when a cursor reaches the end of a data set.

- Other values indicate an exception.

C.3. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code ([1146](#)). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (['42S02'](#)). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value ['HY000'](#) (general error) is used for unmapped errors.
- A message string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_erule.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [1000](#) SQLSTATE: [HY000 \(ER_HASHCHK\)](#)

 - Error: [1653 SQLSTATE: HY000 \(ER_PARTITION_COLUMN_LIST_ERROR\)](#)
Message: Inconsistency in usage of column lists for partitioning
 - Error: [1654 SQLSTATE: HY000 \(ER_WRONG_TYPE_COLUMN_VALUE_ERROR\)](#)
Message: Partition column values of incorrect type
 - Error: [1655 SQLSTATE: HY000 \(ER_TOO_MANY_PARTITION_FUNC_FIELDS_ERROR\)](#)
Message: Too many fields in '%s'
 - Error: [1656 SQLSTATE: HY000 \(ER_MAXVALUE_IN_VALUES_IN\)](#)
Message: Cannot use MAXVALUE as value in VALUES IN
 - Error: [1657 SQLSTATE: HY000 \(ER_TOO_MANY_VALUES_ERROR\)](#)
Message: Cannot have more than one value for this type of %s partitioning
 - Error: [1658 SQLSTATE: HY000 \(ER_ROW_SINGLE_PARTITION_FIELD_ERROR\)](#)
Message: Row expressions in VALUES IN only allowed for multi-field column partitioning
 - Error: [1659 SQLSTATE: HY000 \(ER_FIELD_TYPE_NOT_ALLOWED_AS_PARTITION_FIELD\)](#)
Message: Field '%s' is of a not allowed type for this type of partitioning
 - Error: [1660 SQLSTATE: HY000 \(ER_PARTITION_FIELDS_TOO_LONG\)](#)
Message: The total length of the partitioning fields is too large
 - Error: [1661 SQLSTATE: HY000 \(ER_BINLOG_ROW_ENGINE_AND_STMT_ENGINE\)](#)
Message: Cannot execute statement: impossible to write to binary log since both row-incapable engines and statement-incapable engines are involved.
 - Error: [1662 SQLSTATE: HY000 \(ER_BINLOG_ROW_MODE_AND_STMT_ENGINE\)](#)
Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = ROW and at least one table uses a storage engine limited to statement-based logging.
 - Error: [1663 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_AND_STMT_ENGINE\)](#)
Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage engine is limited to statement-based logging, and BINLOG_FORMAT = MIXED. %s
 - Error: [1664 SQLSTATE: HY000 \(ER_BINLOG_ROW_INJECTION_AND_STMT_ENGINE\)](#)
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and at least one table uses a storage engine limited to statement-based logging.
 - Error: [1665 SQLSTATE: HY000 \(ER_BINLOG_STMT_MODE_AND_ROW_ENGINE\)](#)
Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.%s

- Error: [1666 SQLSTATE: HY000 \(ER_BINLOG_ROW_INJECTION_AND_STMT_MODE\)](#)
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG_FORMAT = STATEMENT.
- Error: [1667 SQLSTATE: HY000 \(ER_BINLOG_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE\)](#)
Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.
- Error: [1668 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_LIMIT\)](#)
Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.
- Error: [1669 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_INSERT_DELAYED\)](#)
Message: The statement is unsafe because it uses INSERT DELAYED. This is unsafe because the times when rows are inserted cannot be predicted.
- Error: [1670 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_SYSTEM_TABLE\)](#)
Message: The statement is unsafe because it uses the general log, slow query log, or performance_schema table(s). This is unsafe because system tables may differ on slaves.
- Error: [1671 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_AUTOINC_COLUMNS\)](#)
Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO_INCREMENT column. Inserted values cannot be logged correctly.
- Error: [1672 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_UDF\)](#)
Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.
- Error: [1673 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_SYSTEM_VARIABLE\)](#)
Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.
- Error: [1674 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_SYSTEM_FUNCTION\)](#)
Message: Statement is unsafe because it uses a system function that may return a different value on the slave.
- Error: [1675 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_NONTRANS_AFTER_TRANS\)](#)
Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.
- Error: [1676 SQLSTATE: HY000 \(ER_MESSAGE_AND_STATEMENT\)](#)
Message: %s Statement: %s
- Error: [1677 SQLSTATE: HY000 \(ER_SLAVE_CONVERSION_FAILED\)](#)
Message: Column %d of table '%s.%s' cannot be converted from type '%s' to type '%s'
- Error: [1678 SQLSTATE: HY000 \(ER_SLAVE_CANT_CREATE_CONVERSION\)](#)
Message: Can't create conversion table for table '%s.%s'
- Error: [1679 SQLSTATE: HY000 \(ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_FORMAT\)](#)
Message: Cannot modify @@session.binlog_format inside a transaction
- Error: [1680 SQLSTATE: HY000 \(ER_PATH_LENGTH\)](#)
Message: The path specified for %s is too long.
- Error: [1681 SQLSTATE: HY000 \(ER_WARN_DEPRECATED_SYNTAX_NO_REPLACEMENT\)](#)
Message: The syntax '%s' is deprecated and will be removed in MySQL %s.
- Error: [1682 SQLSTATE: HY000 \(ER_WRONG_NATIVE_TABLE_STRUCTURE\)](#)

- Message: Native table '%s'.'%s' has the wrong structure
- Error: [1683 SQLSTATE: HY000 \(ER_WRONG_PERFSCHHEMA_USAGE\)](#)
Message: Invalid performance_schema usage.
 - Error: [1684 SQLSTATE: HY000 \(ER_WARN_I_S_SKIPPED_TABLE\)](#)
Message: Table '%s'.'%s' was skipped since its definition is being modified by concurrent DDL statement
 - Error: [1685 SQLSTATE: HY000 \(ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_DIRECT\)](#)
Message: Cannot modify @@session.binlog_direct_non_transactional_updates inside a transaction
 - Error: [1686 SQLSTATE: HY000 \(ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_DIRECT\)](#)
Message: Cannot change the binlog direct flag inside a stored function or trigger
 - Error: [1687 SQLSTATE: 42000 \(ER_SPATIAL_MUST_HAVE_GEOM_COL\)](#)
Message: A SPATIAL index may only contain a geometrical type column
 - Error: [1688 SQLSTATE: HY000 \(ER_TOO_LONG_INDEX_COMMENT\)](#)
Message: Comment for index '%s' is too long (max = %lu)
 - Error: [1689 SQLSTATE: HY000 \(ER_LOCK_ABORTED\)](#)
Message: Wait on a lock was aborted due to a pending exclusive lock
 - Error: [1690 SQLSTATE: 22003 \(ER_DATA_OUT_OF_RANGE\)](#)
Message: %s value is out of range in '%s'
 - Error: [1691 SQLSTATE: HY000 \(ER_WRONG_SPVAR_TYPE_IN_LIMIT\)](#)
Message: A variable of a non-integer type in LIMIT clause
 - Error: [1692 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE\)](#)
Message: Mixing self-logging and non-self-logging engines in a statement is unsafe.
 - Error: [1693 SQLSTATE: HY000 \(ER_BINLOG_UNSAFE_MIXED_STATEMENT\)](#)
Message: Statement accesses nontransactional table as well as transactional or temporary table, and writes to any of them.
 - Error: [1694 SQLSTATE: HY000 \(ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_SQL_LOG_BIN\)](#)
Message: Cannot modify @@session.sql_log_bin inside a transaction
 - Error: [1695 SQLSTATE: HY000 \(ER_STORED_FUNCTION_PREVENTS_SWITCH_SQL_LOG_BIN\)](#)
Message: Cannot change the sql_log_bin inside a stored function or trigger
 - Error: [1696 SQLSTATE: HY000 \(ER_FAILED_READ_FROM_PAR_FILE\)](#)
Message: Failed to read from the .par file
 - Error: [1697 SQLSTATE: HY000 \(ER_VALUES_IS_NOT_INT_TYPE_ERROR\)](#)
Message: VALUES value for partition '%s' must have type INT
 - Error: [1698 SQLSTATE: 28000 \(ER_ACCESS_DENIED_NO_PASSWORD_ERROR\)](#)
Message: Access denied for user '%s'@'%s'
 - Error: [1699 SQLSTATE: HY000 \(ER_SET_PASSWORD_AUTH_PLUGIN\)](#)
Message: SET PASSWORD has no significance for users authenticating via plugins
 - Error: [1700 SQLSTATE: HY000 \(ER_GRANT_PLUGIN_USER_EXISTS\)](#)

Message: GRANT with IDENTIFIED WITH is illegal because the user %.*s already exists

- Error: [1701 SQLSTATE: 42000 \(ER_TRUNCATE_ILLEGAL_FK\)](#)

Message: Cannot truncate a table referenced in a foreign key constraint (%s)

- Error: [1702 SQLSTATE: HY000 \(ER_PLUGIN_IS_PERMANENT\)](#)

Message: Plugin '%s' is force_plus_permanent and can not be unloaded

- Error: [1703 SQLSTATE: HY000 \(ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MIN\)](#)

Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeat will effectively be disabled.

- Error: [1704 SQLSTATE: HY000 \(ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MAX\)](#)

Message: The requested value for the heartbeat period exceeds the value of `slave_net_timeout` seconds. A sensible value for the period should be less than the timeout.

- Error: [1705 SQLSTATE: HY000 \(ER_STMT_CACHE_FULL\)](#)

Message: Multi-row statements required more than 'max_binlog_stmt_cache_size' bytes of storage; increase this mysqld variable and try again

C.4. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the [include/errmsg.h](#) MySQL source file.
- The Message values correspond to the error messages that are listed in the [libmysql/errmsg.c](#) file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [2000 \(CR_UNKNOWN_ERROR\)](#)

Message: Unknown MySQL error

- Error: [2001 \(CR_SOCKET_CREATE_ERROR\)](#)

Message: Can't create UNIX socket (%d)

- Error: [2002 \(CR_CONNECTION_ERROR\)](#)

Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: [2003 \(CR_CONN_HOST_ERROR\)](#)

Message: Can't connect to MySQL server on '%s' (%d)

- Error: [2004 \(CR_IPSOCK_ERROR\)](#)

Message: Can't create TCP/IP socket (%d)

- Error: [2005 \(CR_UNKNOWN_HOST\)](#)

Message: Unknown MySQL server host '%s' (%d)

- Error: [2006 \(CR_SERVER_GONE_ERROR\)](#)

Message: MySQL server has gone away

- Error: [2007 \(CR_VERSION_ERROR\)](#)

- Message: Protocol mismatch; server version = %d, client version = %d
- Error: [2008 \(CR_OUT_OF_MEMORY\)](#)
Message: MySQL client ran out of memory
 - Error: [2009 \(CR_WRONG_HOST_INFO\)](#)
Message: Wrong host info
 - Error: [2010 \(CR_LOCALHOST_CONNECTION\)](#)
Message: Localhost via UNIX socket
 - Error: [2011 \(CR_TCP_CONNECTION\)](#)
Message: %s via TCP/IP
 - Error: [2012 \(CR_SERVER_HANDSHAKE_ERR\)](#)
Message: Error in server handshake
 - Error: [2013 \(CR_SERVER_LOST\)](#)
Message: Lost connection to MySQL server during query
 - Error: [2014 \(CR_COMMANDS_OUT_OF_SYNC\)](#)
Message: Commands out of sync; you can't run this command now
 - Error: [2015 \(CR_NAMEDPIPE_CONNECTION\)](#)
Message: Named pipe: %s
 - Error: [2016 \(CR_NAMEDPIPEWAIT_ERROR\)](#)
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
 - Error: [2017 \(CR_NAMEDPIPEOPEN_ERROR\)](#)
Message: Can't open named pipe to host: %s pipe: %s (%lu)
 - Error: [2018 \(CR_NAMEDPIPESETSTATE_ERROR\)](#)
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
 - Error: [2019 \(CR_CANT_READ_CHARSET\)](#)
Message: Can't initialize character set %s (path: %s)
 - Error: [2020 \(CR_NET_PACKET_TOO_LARGE\)](#)
Message: Got packet bigger than 'max_allowed_packet' bytes
 - Error: [2021 \(CR_EMBEDDED_CONNECTION\)](#)
Message: Embedded server
 - Error: [2022 \(CR_PROBE_SLAVE_STATUS\)](#)
Message: Error on SHOW SLAVE STATUS:
 - Error: [2023 \(CR_PROBE_SLAVE_HOSTS\)](#)
Message: Error on SHOW SLAVE HOSTS:
 - Error: [2024 \(CR_PROBE_SLAVE_CONNECT\)](#)
Message: Error connecting to slave:
 - Error: [2025 \(CR_PROBE_MASTER_CONNECT\)](#)

Message: Error connecting to master:

- Error: [2026 \(CR_SSL_CONNECTION_ERROR\)](#)

Message: SSL connection error

- Error: [2027 \(CR_MALFORMED_PACKET\)](#)

Message: Malformed packet

- Error: [2028 \(CR_WRONG_LICENSE\)](#)

Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: [2029 \(CR_NULL_POINTER\)](#)

Message: Invalid use of null pointer

- Error: [2030 \(CR_NO_PREPARE_STMT\)](#)

Message: Statement not prepared

- Error: [2031 \(CR_PARAMS_NOT_BOUND\)](#)

Message: No data supplied for parameters in prepared statement

- Error: [2032 \(CR_DATA_TRUNCATED\)](#)

Message: Data truncated

- Error: [2033 \(CR_NO_PARAMETERS_EXISTS\)](#)

Message: No parameters exist in the statement

- Error: [2034 \(CR_INVALID_PARAMETER_NO\)](#)

Message: Invalid parameter number

- Error: [2035 \(CR_INVALID_BUFFER_USE\)](#)

Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: [2036 \(CR_UNSUPPORTED_PARAM_TYPE\)](#)

Message: Using unsupported buffer type: %d (parameter: %d)

- Error: [2037 \(CR_SHARED_MEMORY_CONNECTION\)](#)

Message: Shared memory: %s

- Error: [2038 \(CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR\)](#)

Message: Can't open shared memory; client could not create request event (%lu)

- Error: [2039 \(CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR\)](#)

Message: Can't open shared memory; no answer event received from server (%lu)

- Error: [2040 \(CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR\)](#)

Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: [2041 \(CR_SHARED_MEMORY_CONNECT_MAP_ERROR\)](#)

Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: [2042 \(CR_SHARED_MEMORY_FILE_MAP_ERROR\)](#)

Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: [2043 \(CR_SHARED_MEMORY_MAP_ERROR\)](#)

Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: [2044 \(CR_SHARED_MEMORY_EVENT_ERROR\)](#)

Message: Can't open shared memory; client could not create %s event (%lu)

- Error: [2045 \(CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR\)](#)

Message: Can't open shared memory; no answer from server (%lu)

- Error: [2046 \(CR_SHARED_MEMORY_CONNECT_SET_ERROR\)](#)

Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: [2047 \(CR_CONN_UNKNOW_PROTOCOL\)](#)

Message: Wrong or unknown protocol

- Error: [2048 \(CR_INVALID_CONN_HANDLE\)](#)

Message: Invalid connection handle

- Error: [2049 \(CR_SECURE_AUTH\)](#)

Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)

- Error: [2050 \(CR_FETCH_CANCELED\)](#)

Message: Row retrieval was canceled by mysql_stmt_close() call

- Error: [2051 \(CR_NO_DATA\)](#)

Message: Attempt to read column without prior row fetch

- Error: [2052 \(CR_NO_STMT_METADATA\)](#)

Message: Prepared statement contains no metadata

- Error: [2053 \(CR_NO_RESULT_SET\)](#)

C.5. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

C.5.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
 - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
 - The mouse pointer doesn't move.
 - The machine doesn't answer to a remote machine's pings.
 - Other programs that are not related to MySQL don't behave correctly.
 - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.2, “MySQL Server Logs”](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.7, “How to Report Bugs or Problems”](#).

C.5.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

C.5.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 5.4, “The MySQL Access Privilege System”](#), and [Section 5.4.7, “Causes of Access-Denied Errors”](#).

C.5.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `-enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.1.3, “Starting and Troubleshooting the MySQL Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section C.5.2.2.1, “Connection to MySQL Server Failing on Windows”](#).

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section C.5.4.5, “How to Protect or Change the MySQL Unix Socket File”](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section C.5.4.5, “How to Protect or Change the MySQL Unix Socket File”](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section C.5.4.2, “What to Do If MySQL Keeps Crashing”](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

C.5.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor ([Regedt32.exe](#)).

2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: MaxUserPort  
Data Type: REG_DWORD  
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay  
Data Type: REG_DWORD  
Value: 30
```

This sets the number of seconds to hold a TCP port connection in **TIME_WAIT** state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

C.5.2.3. Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

C.5.2.4. Client does not support authentication protocol

MySQL 5.5 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “`newpwd`” in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
 1. Start `mysqld` with the `--old-passwords` option.
 2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for "MySQL, Improved"; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](#).

For additional background on password hashing and authentication, see [Section 5.3.2.3, “Password Hashing in MySQL”](#).

C.5.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

C.5.2.6. Host 'host_name' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '`host_name`' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.  
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests permitted is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.1.4, “Server System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

C.5.2.7. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

`mysqld` actually permits `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 12.4.5.30, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target un-demanding. Windows is limited to $(\text{open tables} \times 2 + \text{open connections}) < 2048$ due to the Posix compatibility layer used on that platform.

Increasing `open-files-limit` may be necessary. Also see [Section 2.5, “Installing MySQL on Linux”](#), for how to raise the operating system limit on how many handles can be used by MySQL.

C.5.2.8. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'  
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)  
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

C.5.2.9. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.4, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section C.5.2.10, “Packet too large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section C.5.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.2.2, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section C.5.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [MySQL Internals: Porting](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.2.3, “The General Query Log”](#).)

See also [Section C.5.2.11, “Communication Errors and Aborted Connections”](#), and [Section 1.7, “How to Report Bugs or Problems”](#).

C.5.2.10. Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.5 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a [Packet too large](#) error and closes the connection. With some clients, you may also get a [Lost connection to MySQL server during query](#) error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

C.5.2.11. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.2.2, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23  Aborted connection 854 to db: 'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `ABORTED CONNECTION` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.

- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.4, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connect attempts can occur for the following reasons:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.1.4, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section C.5.2.10, “Packet too large”](#).

See also [Section C.5.2.9, “MySQL server has gone away”](#).
