The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at [ht-](#)

[tp://www.suse.de/~aj/linux_lfs.html](http://www.suse.de/~aj/linux_lfs.html).

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The [InnoDB](#) storage engine maintains [InnoDB](#) tables within a tablespace that can be created from several files. This enables a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which permits extremely large tables. The maximum tablespace size is 64TB.

If you are using [InnoDB](#) tables and run out of room in the [InnoDB](#) tablespace. In this case, the solution is to extend the [InnoDB](#) tablespace. See [Section 13.6.6, “Adding, Removing, or Resizing InnoDB Data and Log Files”](#).

- You are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is permitted by the internal pointer size. [MyISAM](#) permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB (256⁷ – 1 bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG_ROW_LENGTH](#) and [MAX_ROWS](#) options. See [Section 12.1.14, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum permissible size. See [Section 12.1.6, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG_ROW_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [myisam_data_pointer_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX_ROWS](#) option. The value of [myisam_data_pointer_size](#) can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use [myisamchk -dv /path/to/table-index-file](#). See [Section 12.4.5, “SHOW Syntax”](#), or [Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for [MyISAM](#) tables are as follows:

- If your large table is read only, you can use [myisampack](#) to compress it. [myisampack](#) usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. [myisampack](#) also can merge multiple tables into a single table. See [Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a [MERGE](#) library that enables you to handle a collection of [MyISAM](#) tables that have identical structure as a single [MERGE](#) table. See [Section 13.8, “The MERGE Storage Engine”](#).
- You are using the [MEMORY \(HEAP\)](#) storage engine; in this case you need to increase the value of the [max_heap_table_size](#) system variable. See [Section 5.1.4, “Server System Variables”](#).

C.5.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\sq1a3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start [mysqld](#) with the [--tmpdir](#) option or to add the option to the [\[mysqld\]](#) section of your option file. For example, to specify a directory of [C:\temp](#), use these lines:

```
[mysqld]
tmpdir=C:\temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.3.3, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

C.5.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

C.5.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
      -> WHERE User='some_user' AND Host='some_host';
```

C.5.2.16. Table '`tbl_name`' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 12.4.5, “SHOW Syntax”](#).

C.5.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` or `-DWITH_EXTRA_CHARSETS=charset_name` option. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

All standard MySQL binaries are compiled with `-DWITH_EXTRA_CHARSETS=all`, which enables support for all multi-byte character sets. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

C.5.2.18. '`FILE`' NOT FOUND and Similar Errors

If you get `ERROR '....' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code 23:  File table overflow
shell> perror 24
OS error code 24:  Too many open files
shell> perror 11
OS error code 11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in [Section 7.4.3.1, “How MySQL Opens and Closes Tables”](#). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.4, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.3.3, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the “#” character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

C.5.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as ‘not closed properly’ or ‘crashed’. If this happens, MySQL writes an entry in the `hostname.err` file

'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

As of MySQL 5.5.3, when the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also [Section 5.1.2, “Server Command Options”](#), and [Section 23.5.1.7, “Making a Test Case If You Experience Table Corruption”](#).

C.5.3. Installation-Related Issues

C.5.3.1. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero.

See [Section 2.12, “Environment Variables”](#).

C.5.4. Administration-Related Issues

C.5.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning passwords, see [Section 2.10.2, “Securing the Initial MySQL Accounts”](#).

If you know the `root` password, but want to change it, see [Section 12.4.1.6, “SET PASSWORD Syntax”](#).

If you set a `root` password previously, but have forgotten it, you can set a new password. The following sections provide instructions for Windows and Unix systems, as well as generic instructions that apply to any system.

C.5.4.1.1. Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for all MySQL `root` accounts:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the `START` menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list and stop it.
If your server is not running as a service, you may need to use the Task Manager to force it to stop.
3. Create a text file containing the following statements. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **START** menu, select Run, then enter `cmd` as the command to be run.
6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

```
C:\> C:\mysql\bin\mysqld --init-file=C:\\mysql-init.txt
```

If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.5\bin\mysqld.exe"
      --defaults-file="C:\\Program Files\\MySQL\\MySQL Server 5.5\\my.ini"
      --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the **START** menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list, right-click it, and choose the **Properties** option. The **Path to executable** field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

C.5.4.1.2. Resetting the Root Password: Unix Systems

On Unix, use the following procedure to reset the password for all MySQL `root` accounts. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the `mysqld` server runs as (for example, `mysql`).
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users.

5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

C.5.4.1.3. Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions for Windows and Unix systems. Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges.
2. Connect to the `mysqld` server with this command:

```
shell> mysql
```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

```
mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
      -> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

The `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option).

C.5.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.2.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `re-solve_stack_dump` program. See [MySQL Internals: Porting](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `-delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.

- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all `MyISAM` tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.2.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.2.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.7, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [MySQL Internals: Porting](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 23.1.2, “The MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See [MySQL Internals: Porting](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
 1. Start `mysqld` from `gdb` (or another debugger). See [MySQL Internals: Porting](#).
 2. Run your test scripts.
 3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.7, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or

`TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

C.5.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

C.5.4.4. Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 5.5, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“`:`”) on Unix and semicolon characters (“`;`”) on Windows.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file

directory is located.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

C.5.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.2.3.3, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

C.5.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Section 2.12, “Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

C.5.5. Query-Related Issues

C.5.5.1. Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if "e" and "é" have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 12.1.14, "CREATE TABLE Syntax"](#).

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
-> @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
|          0 |
+-----+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-----+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-----+
|          1 |
+-----+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
|          0 |
+-----+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-----+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-----+
|          1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci      |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-----+-----+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-----+-----+
|      binary            |      binary        |
+-----+-----+
```

C.5.5.2. Problems Using DATE Columns

The format of a `DATE` value is '`YYYY-MM-DD`'. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to permit a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, '`2004-08-15`' and '`2004#08#15`' are equivalent.) MySQL can also convert a string containing no separators (such as '`20040815`'), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date '`0000-00-00`' can be stored and retrieved as '`0000-00-00`'. When using a '`0000-00-00`' date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in '`YYYY-MM-DD`' format and performs a string comparison. It does not convert '`20030505`' to the date '`2003-05-05`' and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also permits you to store '`0000-00-00`' as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a `0` is stored in the `DATE` column, which is retrieved as '`0000-00-00`'. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by `IGNORE`), you should set `sql_mode` to

```
"NO_ZERO_IN_DATE,NO_ZERO_DATE".
```

C.5.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string '''. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with `NULL` Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with '''. If you want a `NULL` value in a column, you should use \N in the data file. The literal word “`NULL`” may also be used under some circumstances. See [Section 12.2.6, “`LOAD DATA INFILE` Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

C.5.5.4. Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
```

```
WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name  
GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name  
GROUP BY 'a';
```

C.5.5.5. Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';  
SHOW CREATE TABLE tbl_name;
```

See [Section 12.4.5.37, “SHOW TABLE STATUS Syntax”](#), and [Section 12.4.5.12, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 12.4.5.17, “SHOW ENGINES Syntax”](#), and [Section 12.4.5.40, “SHOW VARIABLES Syntax”](#).

C.5.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

C.5.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 12.8.2, “EXPLAIN Syntax”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section C.5.5.8, “Problems with Floating-Point Values”](#).
6. If you still can't figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

C.5.5.8. Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;

+---+---+---+
| i | a   | b   |
+---+---+---+
| 1 | 21.4 | 21.4 |
| 2 | 76.8 | 76.8 |
| 3 | 7.4  | 7.4  |
| 4 | 15.4 | 15.4 |
| 5 | 7.2  | 7.2  |
| 6 | -51.4| 0     |
+---+---+---+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

i	a	b
6	-51.4	0

1 row in set (0.00 sec)

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+-----+
| i   | a      | b      |
+-----+
| 1   | 21.4   | 21.4   |
| 2   | 76.8   | 76.8   |
| 3   | 7.4    | 7.4    |
| 4   | 15.4   | 15.4   |
| 5   | 7.2    | 7.2    |
+-----+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. Other others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

C.5.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `PLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 12.8.2, “EXPLAIN Syntax”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 12.4.2.1, “ANALYZE TABLE Syntax”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 12.2.9.2, “Index Hint Syntax”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 12.2.9, “SELECT Syntax”](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `-max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.4, “Server System Variables”](#).

C.5.7. Table Definition-Related Issues

C.5.7.1. Problems with `ALTER TABLE`

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the

cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'  
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

C.5.7.2. TEMPORARY Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.
Temporary tables are not supported for MySQL Cluster.
- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;  
ERROR 1137: Can't reopen table: 'temp_table'
```

This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 17.4.1, “Replication Features and Issues”](#), for more information.

C.5.8. Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.1, “General Installation Guidance”](#), and [MySQL Internals: Porting](#).

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.

- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` statement before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` statement wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log file names are based on the server host name (if you don't specify a file name with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your host name to something else. Another option is to re-

name the old files to reflect your host name change (if these are binary logs, you need to edit the binary log index file and fix the binary log file names there as well). See [Section 5.1.2, “Server Command Options”](#).

- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See [Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “`_`” or “`%`” with `ESCAPE` in `LIKE ... ESCAPE`.
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use the general query log extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, not 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.

- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

Appendix D. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.5, which is currently MySQL 5.5.10. We offer a version of the Manual for each series of MySQL releases (5.0, 5.1, and so forth). For information about changes in another release series of the MySQL database software, see the corresponding version of this Manual.

We update this section as we add new features in the 5.5 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

D.1. Changes in Release 5.5.x (Production)

An overview of features added in MySQL 5.5 can be found here: [Section 1.5, “What Is New in MySQL 5.5”](#). For a full list of changes, please refer to the changelog sections for individual 5.5 releases.

For discussion of upgrade issues that you may encounter for upgrades from MySQL 5.1 to MySQL 5.5, see [Section 2.11.1.1, “Upgrading from MySQL 5.1 to 5.5”](#).

For discussion of upgrade issues that you may encounter for upgrades from MySQL 5.4 to MySQL 5.5, see [Section 2.11.1.2, “Upgrading from MySQL 5.4 to 5.5”](#).

D.1.1. Changes in MySQL 5.5.10 (Not yet released)

Functionality added or changed:

- Boolean system variables can be enabled at run time by setting them to the value `ON` or `OFF`, but previously this did not work at server startup. Now at startup such variables can be enabled by setting them to `ON` or `TRUE`, or disabled by setting them to `OFF` or `FALSE`. Any other nonnumeric variable is invalid. ([Bug#46393](#))

See also [Bug#51631](#).

Bugs fixed:

- `--autocommit=ON` did not work (it set the global `autocommit` value to 0, not 1). ([Bug#59432](#))
- The `DEFAULT_CHARSET` and `DEFAULT_COLLATION` CMake options did not work. ([Bug#58991](#))
- The fix for [Bug#25192](#) caused `load_defaults()` to add an argument separator to distinguish options loaded from configuration files from those provided on the command line, whether or not the application needed it. ([Bug#57953](#))

D.1.2. Changes in MySQL 5.5.9 (Not yet released)

Functionality added or changed:

- The `mysqladmin` and `mysqldump` clients now have `--default-auth` and `--plugin-dir` options for specifying which authentication plugin and plugin directory to use. ([Bug#58139](#))
- `sql_priv.h` now includes an `OPTION_ALLOW_BATCH` flag for the `transaction_allow_batching` feature of MySQL Cluster. ([Bug#57604](#))
- Boolean system variables can be enabled at run time by setting them to the value `ON` or `OFF`, but previously this did not work at server startup. Now at startup such variables can be enabled by setting them to `ON` or `TRUE`. Any other nonnumeric variable is interpreted as `OFF`. ([Bug#46393](#) improves on this such that `ON`, `TRUE`, `OFF`, and `FALSE` are recognized, and other values are

invalid.) ([Bug#51631](#))

Bugs fixed:

- **Incompatible Change:** When `auto_increment_increment` is greater than one, values generated by a bulk insert that reaches the maximum column value could wrap around rather producing an overflow error.

As a consequence of the fix, it is no longer possible for an auto-generated value to be equal to the maximum `BIGINT UNSIGNED` value. It is still possible to store that value manually, if the column can accept it. ([Bug#39828](#))

- **MySQL Cluster:** Issuing `EXPLAIN EXTENDED` for a query that would use condition pushdown could cause `mysqld` to crash. ([Bug#58553](#))
- **Partitioning: InnoDB Storage Engine:** The partitioning handler did not pass locking information to a table's storage engine handler. This caused high contention and thus slower performance when working with partitioned `InnoDB` tables. ([Bug#59013](#))
- **InnoDB Storage Engine:** When multiple `InnoDB` buffer pools were enabled, `SHOW ENGINE INNODB` commands displayed information about each one, but not summary information combining statistics for the entire buffer pool subsystem. Now, the aggregated information is displayed in the `BUFFER POOL AND MEMORY` section, and information about individual buffer pool instances is displayed in a new `INDIVIDUAL BUFFER POOL INFO` section. ([Bug#58461](#))
- **InnoDB Storage Engine:** The command to create a debug build (`cmake -DWITH_DEBUG ...`) now automatically sets the `InnoDB` debugging flag `UNIV_DEBUG` on all platforms. Formerly, the `UNIV_DEBUG` flag might not be set for Windows platforms with Visual Studio and not on OS X with Xcode. ([Bug#58279](#))
- **InnoDB Storage Engine:** In `InnoDB` status output, the value for `I/O sum[]` could be incorrect, displayed as a very large number. ([Bug#57600](#))
- **InnoDB Storage Engine:** It was not possible to query the `information_schema.innodb_trx` table while other connections were running queries involving BLOB types. ([Bug#55397](#))
- **InnoDB Storage Engine:** When the `lowercase_system_names` variable was set to 2, `InnoDB` could fail to restore a `mysqldump` dump of a table with foreign key constraints involving case-sensitive names. ([Bug#55222](#))
- **InnoDB Storage Engine:** The `OPTIMIZE TABLE ... TRUNCATE PARTITION` statement would reset the auto-increment counter for an `InnoDB` table. Now the auto-increment value is preserved across this operation. ([Bug#18274](#))
- **Partitioning:** A failed `ALTER TABLE ... TRUNCATE PARTITION` statement was still written to the binary log. ([Bug#58147](#))
- **Replication:** While an `INSERT DELAYED` statement with a single inserted value does not return any visible warnings, such a warning could be still written into the error log. ([Bug#57666](#))

See also [Bug#49567](#).

- **Replication:** When closing a session that used temporary tables, binary logging could sometimes fail with a spurious `FAILED TO WRITE THE DROP STATEMENT FOR TEMPORARY TABLES TO BINARY LOG.` ([Bug#57288](#))
- **Replication:** Due to changes made in MySQL 5.5.3, settings made in the `binlog_cache_size` and `max_binlog_cache_size` server system variables affected both the binary log statement cache (also introduced in that version) and the binary log transactional cache (formerly known simply as the binary log cache). This meant that the resources used as a result of setting either or both of these variables were double the amount expected. To rectify this problem, these variables now affect only the transactional cache. The fix for this issue also introduces two new system variables `binlog_stmt_cache_size` and `max_binlog_stmt_cache_size`, which affect only the binary log statement cache.

In addition, the `Binlog_cache_use` status variable was incremented whenever either cache was used, and `Binlog_cache_disk_use` was incremented whenever the disk space from either cache was used, which caused problems with performance tuning of the statement and transactional caches, because it was not possible to determine which of these was being exceeded when attempting to troubleshoot excessive disk seeks and related problems. This issue is solved by changing the behavior of these two status variables such that they are incremented only in response to usage of the binary log transactional cache, as well as by introducing two new status variables `Binlog_stmt_cache_use` and `Binlog_stmt_cache_disk_use`, which are incremented only by usage of the binary log statement cache.

For more information, see [System variables used with the binary log](#), and [Section 5.1.6, “Server Status Variables”](#). ([Bug#57275](#))

- **Replication:** By default, a value is generated for an `AUTO_INCREMENT` column by inserting either `NULL` or 0 into the column. Setting the `NO_AUTO_VALUE_ON_ZERO` server SQL mode suppresses this behavior for 0, so that it occurs only

when `NULL` is inserted into the column.

This behavior is also followed on a replication slave (by the slave SQL thread) when applying events that have been logged on the master using the statement-based format. However, when applying events that had been logged using the row-based format, `NO_AUTO_VALUE_ON_ZERO` was ignored, which could lead to an assertion.

To fix this issue, the value of an `AUTO_INCREMENT` column is no longer generated when applying an event that was logged using the row-based row format, as this value is already contained in the changes applied on the slave. ([Bug#56662](#))

- **Replication:** The `Binlog_cache_use` and `Binlog_cache_disk_use status` variables were incremented twice by a change to a table using a transactional storage engine. ([Bug#56343](#))
- **Replication:** The `BINLOG` statement modified the values of session variables, which could lead to problems with operations such a point-in-time recovery. One such case occurred when replaying a row-based binary log which relied on setting `foreign_key_checks = OFF` on the session level in order to create and populate a set of `InnoDB` tables having foreign key constraints. ([Bug#54903](#))
- **Replication:** `mysqlbinlog` printed `USE` statements to its output only when the default database changed between events. To illustrate how this could cause problems, suppose that a user issued the following sequence of statements:

```
CREATE DATABASE mydb;
USE mydb;
CREATE TABLE mytable (column_definitions);
DROP DATABASE mydb;
CREATE DATABASE mydb;
USE mydb;
CREATE TABLE mytable (column_definitions);
```

When played back using `mysqlbinlog`, the second `CREATE TABLE` statement failed with `ERROR: NO DATABASE SELECTED` because the second `USE` statement was not played back, due to the fact that a database other than `mydb` was never selected.

This fix insures that `mysqlbinlog` outputs a `USE` statement whenever it reads one from the binary log. ([Bug#50914](#))

- **Replication:** Previously, when a statement failed with a different error on the slave than on the master, the slave SQL thread displayed a message containing:
 - The error message for the master error code
 - The master error code
 - The error message for the slaves error code
 - The slave error code

However, the slave has no information with which to fill in any print format specifiers for the master message, so it actually displayed the message format string. To make it clearer that the slave is not displaying the actual message as it appears on the master, the slave now indicates that the master part of the output is the message format, not the actual message. For example, previously the slave displayed information like this:

Error: "Query caused different errors on master and slave. Error on master: 'Duplicate entry '%-.192s' for key %d' (1062), Error on slave: 'no error' (0). Default database: 'test'. Query: 'insert into t1 values(1),(2)'" (expected different error codes on master and slave)

Now the slave displays this:

Error: "Query caused different errors on master and slave. Error on master: message format='Duplicate entry '%-.192s' for key %d' error code=1062 ; Error on slave: actual message='no error', error code=0. Default database: 'test'. Query: 'insert into t1 values(1),(2)'" (expected different error codes on master and slave) ([Bug#46697](#))

- **Replication:** When an error occurred in the generation of the name for a new binary log file, the error was logged but not shown to the user. ([Bug#46166](#))

See also [Bug#37148](#), [Bug#40611](#), [Bug#43929](#), [Bug#51019](#).

- Comparisons of aggregate values with `TIMESTAMP` values were incorrect. ([Bug#59330](#))
- `MIN(year_col)` could return an incorrect result in some cases. ([Bug#59211](#))
- In a subquery, a `UNION` with no referenced tables (or only a reference to the virtual table `dual`) did not allow an `ORDER BY` clause. ([Bug#58970](#))
- Configuring MySQL with `-DWITHOUT_PERFSHEMA_STORAGE_ENGINE=1` caused build failures. ([Bug#58953](#))

- Several Valgrind warnings were fixed. ([Bug#58948](#), [Bug#59021](#))
 - `OPTIMIZE TABLE` for an `InnoDB` table could raise an assertion if the operation failed because it had been killed. ([Bug#58933](#))
 - If `max_allowed_packet` was set larger than 16MB, the server failed to reject too-large packets with “Packet too large” errors. ([Bug#58887](#))
 - `EXPLAIN` could crash for queries that accessed two derived tables. ([Bug#58730](#))
 - On Solaris, the MySQL build failed if it was configured with debugging enabled. ([Bug#58699](#))
 - An assertion could be raised for queries for which the optimizer could choose between Index Merge range access or const ref access methods. ([Bug#58456](#))
 - If MySQL was built with Visual Studio Express, the project wixca was not built. ([Bug#58411](#))
 - `EXPLAIN` could crash for queries that used `GROUP_CONCAT()`. ([Bug#58396](#))
 - `CMake` polluted the source tree by writing installation-related temporary files there. ([Bug#58372](#))
 - Security context references in `sp_head.cc` were rewritten for improved DTrace compatibility. ([Bug#58350](#))
 - The `ucs2` character set does not support characters outside the Basic Multilingual Plane (BMP), but converting a string containing such characters did not produce a conversion-failure warning. ([Bug#58321](#))
 - A Valgrind failure occurred in `fn_format` when called from `archive_discover`. ([Bug#58205](#))
 - `CMake` did not add `LINK_LIBRARIES` for `MYSQL_ADD_PLUGIN` for `libmysqld`. ([Bug#58158](#))
 - An assertion could be raised if the server was closing a session at the same time the session was being killed by another thread. ([Bug#58136](#))
 - Configuration with maintainer mode enabled resulted in errors when compiling with `icc`. ([Bug#57991](#), [Bug#58871](#))
 - An `ORDER BY` clause was bound to the incorrect substatement when used in `UNION` context. ([Bug#57986](#))
 - The `BIT_AND()` function could return incorrect results when a join returned no matching rows. ([Bug#57954](#))
 - If the set of values aggregated with `AVG(DISTINCT)` contained a `NULL` value, the function result could be incorrect. ([Bug#57932](#))
 - In rare cases, `LIKE` expressions failed for an indexed column that used a collation containing contractions. ([Bug#57737](#))
 - Unnecessary subquery evaluation in contexts such as statement preparation or view creation could cause a server crash. ([Bug#57703](#))
 - View creation could produce Valgrind warnings. ([Bug#57352](#))
 - `NULL` geometry values could cause a crash in `Item_func_spatial_collection::fix_length_and_dec`. ([Bug#57321](#))
 - It was possible to compile `mysqld` with Performance Schema support but with a dummy atomic-operations implementation, which caused a server crash. This problem does not affect binary distributions. It is helpful as a safety measure for users who build MySQL from source. ([Bug#56769](#))
 - The `cp1251` character set did not properly support the Euro sign (`0x88`). For example, converting a string containing this character to `utf8` resulted in ‘?’ rather than the `utf8` Euro sign. ([Bug#56639](#))
 - Some unsigned system variables could be displayed with negative values. ([Bug#55794](#))
 - `CREATE DATABASE` and `DROP DATABASE` caused `mysql --one-database` to lose track of the statement-filtering context. ([Bug#54899](#))
 - An assertion could be raised during concurrent execution of `DROP DATABASE` and `REPAIR TABLE` if the drop deleted a table's `.TMD` file at the same time the repair tried to read details from the old file that was just removed.
- A problem could also occur when `DROP TABLE` tried to remove all files belonging to a table at the same time `REPAIR TABLE` had just deleted the table's `.TMD` file. ([Bug#54486](#))
- When `mysqld` printed crash dump information, it incorrectly indicated that some valid pointers were invalid. ([Bug#51817](#))

- On FreeBSD, if `mysqld` was killed with a `SIGHUP` signal, it could corrupt `InnoDB .ibd` files. ([Bug#51023](#))
- An assertion could be raised if `-1` was inserted into an `AUTO_INCREMENT` column by a statement writing more than one row. ([Bug#50619](#))
- If a client supplied a user name longer than the maximum 16 characters allowed for names stored in the MySQL grant tables, all characters were being considered significant. Historically, only the first 16 characters were used to check for a match; this behavior was restored. ([Bug#49752](#))
- The `my_seek()` and `my_tell()` functions ignored the `MY_WME` flag when they returned an error, which could cause client programs to hang. ([Bug#48451](#))
- During assignment of values to system variables, legality checks on the value range occurred too late, preventing proper error checking. ([Bug#43233](#))
- On Solaris, time-related functions such as `NOW()` or `SYSDATE()` could return a constant value. ([Bug#42054](#))
- If the remote server for a `FEDERATED` table could not be accessed, queries for the `INFORMATION_SCHEMA.TABLES` table failed. ([Bug#35333](#))

D.1.3. Changes in MySQL 5.5.8 (03 December 2010 General Availability)

Configuration Notes:

- MySQL releases are now built on all platforms using `CMake` rather than the GNU autotools, so autotools support has been removed. For instructions on building MySQL with `CMake`, see [Section 2.9, “Installing MySQL from Source”](#). Third-party tools that need to extract the MySQL version number formerly found in `configure.in` can use the `VERSION` file. See [Section 2.9.6, “MySQL Configuration and Third-Party Tools”](#).

Functionality added or changed:

- Support for the `IBMDB2I` storage engine has been removed. ([Bug#58079](#))
- The following words are no longer reserved words the way they are in earlier MySQL 5.5 releases: `SLOW`, `GENERAL`, `IGNORE_SERVER_IDS`, `MASTER_HEARTBEAT_PERIOD` ([Bug#57899](#))
- The `autocommit` system variable is enabled by default for all user connections, and the session value can be set for each new connection by setting the `init_connect` system variable to `SET autocommit=0`. However, this has no effect for users who have the `SUPER` privilege.

Now the global `autocommit` value can be set at server startup, and this value is used to initialize the session value for all new connections, including those for users with the `SUPER` privilege. The variable is treated as a boolean value so it can be enabled with `--autocommit`, `--autocommit=1`, or `--enable-autocommit`. It can be disabled with `--autocommit=0`, `--skip-autocommit`, or `--disable-autocommit`. ([Bug#57316](#))

- The client/server protocol now includes a `SERVER_QUERY_WAS_SLOW` flag to indicate when a query is slow; that is, when query execution exceeds the value of the `long_query_time` system variable. ([Bug#57058](#))
- The time zone tables available at <http://dev.mysql.com/downloads/timezones.html> have been updated. These tables can be used on systems such as Windows or HP-UX that do not include zoneinfo files. ([Bug#40230](#))
- A `--bind-address` option has been added to a number of MySQL client programs: `mysql`, `mysqldump`, `mysqladmin`, `mysqlbinlog`, `mysqlcheck`, `mysqldump`, and `mysqlshow`. This is for use on a computer having multiple network interfaces, and enables you to choose which interface is used to connect to the MySQL server.

Bugs fixed:

- **Performance: InnoDB Storage Engine:** Improved concurrency when several `ANALYZE TABLE` or `SHOW TABLE STATUS` statements are run simultaneously for `InnoDB` tables. ([Bug#53046](#))
- **Incompatible Change:** Previously, tables in the `performance_schema` database had uppercase names. This was incompatible with the `lower_case_table_names` system variable, and caused issues when the variable value was changed *after* installing or upgrading.

Now `performance_schema` table names are lowercase, so they appear in uniform lettercase regardless of the

`lower_case_table_names` setting. References to these tables in SQL statements should be given in lowercase. This is an incompatible change, but provides compatible behavior across different values of `lower_case_table_names`.

If you upgrade to MySQL 5.5.8 from an earlier version of MySQL 5.5, be sure to run `mysql_upgrade` (and restart the server) to change the names of existing `performance_schema` tables from uppercase to lowercase. If `mysql_upgrade` does not work, use this procedure:

1. Stop `mysqld`.
2. Remove the `performance_schema/* .frm` files from the data directory.
3. Create a separate “dummy” MySQL 5.5.8 installation.
4. Copy the `performance_schema/* .frm` files from the dummy installation to the installation you are upgrading.
5. Restart `mysqld` and run `mysqld_upgrade --force` and check that it does not produce errors.
6. Remove the dummy installation.

(Bug#57609)

- **Incompatible Change:** The following changes were made to the `performance_schema.threads` table for conformance with the implementation in MySQL 5.6:

- `ID` column: Renamed to `PROCESSLIST_ID`, removed `NOT NULL` from definition.
- `NAME` column: Changed from `VARCHAR(64)` to `VARCHAR(128)`.

(Bug#57154)

- **Incompatible Change:** Starvation of `FLUSH TABLES WITH READ LOCK` statements occurred when there was a constant load of concurrent DML statements in two or more connections. Deadlock occurred when a connection that had some table open through a `HANDLER` statement tried to update data through a DML statement while another connection tried to execute `FLUSH TABLES WITH READ LOCK` concurrently.

These problems resulted from the global read lock implementation, which was reimplemented with the following consequences:

- To solve deadlock in event-handling code that was exposed by this patch, the `LOCK_event_metadata` mutex was replaced with metadata locks on events. As a result, DDL operations on events are now prohibited under `LOCK TABLES`. This is an incompatible change.
- The global read lock (`FLUSH TABLES WITH READ LOCK`) no longer blocks DML and DDL on temporary tables. Before this patch, server behavior was not consistent in this respect: In some cases, DML/DDL statements on temporary tables were blocked; in others, they were not. Since the main use cases for `FLUSH TABLES WITH READ LOCK` are various forms of backups and temporary tables are not preserved during backups, the server now consistently allows DML/DDL on temporary tables under the global read lock.
- The set of thread states has changed:
 - `Waiting for global metadata lock` is replaced by `Waiting for global read lock`.
 - Previously, `Waiting for release of readlock` was used to indicate that DML/DDL statements were waiting for release of a read lock and `Waiting to get readlock` was used to indicate that `FLUSH TABLES WITH READ LOCK` was waiting to acquire a global read lock. Now `Waiting for global read lock` is used for both cases.
 - Previously, `Waiting for release of readlock` was used for all statements that caused an explicit or implicit commit to indicate that they were waiting for release of a read lock and `Waiting for all running commits to finish` was used by `FLUSH TABLES WITH READ LOCK`. Now `Waiting for commit lock` is used for both cases.
 - There are two other new states, `Waiting for trigger metadata lock` and `Waiting for event metadata lock`.

(Bug#57006, Bug#54673)

- **InnoDB Storage Engine:** Values could be truncated in certain `INFORMATION_SCHEMA` columns, such as `REFERENTIAL_CONSTRAINTS.REFERENCED_TABLE_NAME` and `KEY_COLUMN_USAGE.REFERENCED_TABLE_NAME`.
(Bug#57960)

- **InnoDB Storage Engine:** For an InnoDB table created with `ROW_FORMAT=COMPRESSED` or `ROW_FORMAT=DYNAMIC`, a query using the `READ UNCOMMITTED` isolation level could cause the server to stop with an assertion error, if `BLOB` or other large columns that use off-page storage were being inserted at the same time. ([Bug#57799](#))
- **InnoDB Storage Engine:** The server could stop with an assertion error on Windows Vista and Windows 7 systems. ([Bug#57720](#))
- **InnoDB Storage Engine:** A followup fix to [Bug#54678](#). `TRUNCATE TABLE` could still cause a crash (assertion error) in the debug version of the server. ([Bug#57700](#))
- **InnoDB Storage Engine:** The InnoDB system tablespace could grow continually for a server under heavy load. ([Bug#57611](#))
- **InnoDB Storage Engine:** Heavy concurrent updates of a BLOB column in an InnoDB table could cause a hang. ([Bug#57579](#))
- **InnoDB Storage Engine:** Turning off the `innodb_stats_on_metadata` option could prevent the `ANALYZE TABLE` statement from updating the cardinality statistics of InnoDB tables. ([Bug#57252](#))
- **InnoDB Storage Engine:** A query for an InnoDB table could return the wrong value if a column value was changed to a different case, and the column had a case-insensitive index. ([Bug#56680](#))
- **InnoDB Storage Engine:** An existing InnoDB table could be switched to `ROW_FORMAT=COMPRESSED` implicitly by a `KEY_BLOCK_SIZE` clause in an `ALTER TABLE` statement. Now, the row format is only switched to compressed if there is an explicit `ROW_FORMAT=COMPRESSED` clause on the `ALTER TABLE` statement.

Any valid, non-default `ROW_FORMAT` parameter takes precedence over `KEY_BLOCK_SIZE` when both are specified. `KEY_BLOCK_SIZE` only enables `ROW_FORMAT=COMPRESSED` if `ROW_FORMAT` is not specified on either the `CREATE TABLE` or `ALTER TABLE` statement, or is specified as `DEFAULT`. In case of a conflict between `KEY_BLOCK_SIZE` and `ROW_FORMAT` clauses, the `KEY_BLOCK_SIZE` is ignored if `innodb_strict_mode` is off, and the statement causes an error if `innodb_strict_mode` is on. ([Bug#56632](#))

- **InnoDB Storage Engine:** The clause `KEY_BLOCK_SIZE=0` is now allowed on `CREATE TABLE` and `ALTER TABLE` statements for InnoDB tables, regardless of the setting of `innodb_strict_mode`. The zero value has the effect of resetting the `KEY_BLOCK_SIZE` table parameter to its default value, depending on the `ROW_FORMAT` parameter, as if it had not been specified. That default is 8 if `ROW_FORMAT=COMPRESSED`. Otherwise, `KEY_BLOCK_SIZE` is not used or stored with the table parameters.

As a consequence of this fix, `ROW_FORMAT=FIXED` is not allowed when the `innodb_strict_mode` is enabled. ([Bug#56628](#))

- **InnoDB Storage Engine:** A large number of foreign key declarations could cause the output of the `SHOW CREATE STATEMENT` statement to be truncated. ([Bug#56143](#))
- **InnoDB Storage Engine:** A compilation problem affected the InnoDB source code on NetBSD/sparc64. ([Bug#53916](#))
- **InnoDB Storage Engine:** Clarified the message when a `CREATE TABLE` statement fails because a foreign key constraint does not have the required indexes. ([Bug#16290](#))
- **Partitioning:** “Fast” `ALTER TABLE` operations (that do not involve a table copy) on a partitioned table could leave the table in an unusable state. ([Bug#57985](#))
- **Partitioning:** An `INSERT ... ON DUPLICATE KEY UPDATE column = 0` statement on an `AUTO_INCREMENT` column caused the debug server to crash. ([Bug#57890](#))
- **Replication:** Concurrent statements using a stored function and a `DROP DATABASE` statement that caused the same stored function to be dropped could cause statement-based replication to fail. This problem is resolved by making sure that `DROP DATABASE` takes an exclusive metadata lock on all stored functions and stored procedures that it causes to be dropped. ([Bug#57663](#))

See also [Bug#30977](#).

- **Replication:** When `STOP SLAVE` is issued, the slave SQL thread rolls back the current transaction and stops immediately if the transaction updates only tables which use transactional storage engines are updated. Previously, this occurred even when the transaction contained `CREATE TEMPORARY TABLE` statements, `DROP TEMPORARY TABLE` statements, or both, although these statements cannot be rolled back. Because temporary tables persist for the lifetime of a user session (in the case, the replication user), they remain until the slave is stopped or reset. When the transaction is restarted following a subsequent `START SLAVE` statement, the SQL thread aborts with an error that a temporary table to be created (or dropped) already exists (or does not exist, in the latter case).

Following this fix, if an ongoing transaction contains `CREATE TEMPORARY TABLE` statements, `DROP TEMPORARY TABLE` statements, or both, the SQL thread now waits until the transaction ends, then stops. ([Bug#56118](#))

- **Replication:** If there exist both a temporary table and a non-temporary table having the same, updates normally apply only to the temporary table, with the exception of a `CREATE TABLE ... SELECT` statement that creates a non-temporary table having the same name as an existing temporary table. When such a statement was replicated using the `MIXED` logging format, and the statement was unsafe for row-based logging, updates were misapplied to the temporary table.

Updates were also applied wrongly when a temporary table that used a transactional storage engine was dropped inside a transaction, followed by updates within the same transaction to a non-temporary table having the same name. ([Bug#55478](#))

See also [Bug#47899](#), [Bug#55709](#).

- **Replication:** When making changes to relay log settings using `CHANGE MASTER TO`, the I/O cache was not cleared. This could result in replication failure when the slave attempted to read stale data from the cache and then stopped with an assertion. ([Bug#55263](#))
- **Replication:** Replication of `SET` and `ENUM` columns represented using more than 1 byte (that is, `SET` columns with more than 8 members and `ENUM` columns with more than 256 constants) between platforms using different endianness failed when using the row-based format. This was because columns of these types are represented internally using integers, but the internal functions used by MySQL to handle them treated them as strings. ([Bug#52131](#))

See also [Bug#53528](#).

- **Replication:** Trying to read from a binary log containing a log event of an invalid type caused the slave to crash. ([Bug#38718](#))
- **Replication:** When replicating the `mysql.tables_priv` table, the `Grantor` column was not replicated, and was thus left empty on the slave. ([Bug#27606](#))
- Setting the `read_only` system variable at server startup did not work. ([Bug#58669](#))
- `mysql_upgrade` failed after an upgrade from MySQL 5.1. ([Bug#58514](#))
- When configuring the build with `-DBUILD_CONFIG=mysql_release` and building with Visual Studio Express, the build failed if `signtool.exe` was not present. ([Bug#58313](#))
- With `CMake` 2.8.3, the `-DBUILD_CONFIG=mysql_release` option did not work. ([Bug#58272](#))
- When configuring the build with `-DBUILD_CONFIG=mysql_release` on Linux, `libaio` is required, but the error message if it was missing was uninformative. ([Bug#58227](#))
- Use of `NAME_CONST()` in a `HAVING` clause caused a server crash. ([Bug#58199](#))
- `BETWEEN` did not use indexes for `DATE` or `DATETIME` columns. ([Bug#58190](#))
- Memory was allocated in `fn_expand()` for storing path names, but not freed anywhere. ([Bug#58173](#))
- In debug builds, inserting a `FLOAT` value into a `CHAR(0)` column could crash the server. ([Bug#58137](#))
- Failure to create a thread to handle a user connection could result in a server crash. ([Bug#58080](#))
- During configuration, `ADD_VERSION_INFO` in `cmake/mysql_version.cmake` failed if `LINK_FLAGS` was modified. ([Bug#58074](#))
- Performance Schema did not account for I/O for the binary log file (no I/O was counted). ([Bug#58052](#))
- Several compilation problems were fixed. ([Bug#57992](#), [Bug#57993](#), [Bug#57994](#), [Bug#57995](#), [Bug#57996](#), [Bug#57997](#), [Bug#58057](#))
- After creation of a table with two foreign key constraints, the `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` table displayed only one of them. ([Bug#57904](#))
- Incorrect error handling raised an assertion if character set conversion wrapped an item that failed. ([Bug#57882](#))
- In debug builds, a missing `DBUG_RETURN` macro in `sql/client.c` caused `mysql` to be unable to connect to the server. ([Bug#57744](#))
- Clients using a client library older than MySQL 5.5.7 suffered loss of connection after executing `mysql_change_user()` while connected to a 5.5.7 server. ([Bug#57689](#))
- The `MySQL-shared` RPM package failed to provide the lowercase virtual identifier '`mysql-shared`' in the RPM '`Provides`' tags (usually used for backward compatibility). ([Bug#57596](#))
- For an upgrade to MySQL 5.5.7 from a previous release, the server exited if the `mysql.proxies_priv` table did not exist,

making upgrades inconvenient. Now the server treats a missing `proxies_priv` table as equivalent to an empty table. However, after starting the server, you should still run `mysql_upgrade` to create the table. ([Bug#57551](#))

- `SHOW PROCESSLIST` displayed non-ASCII characters improperly. ([Bug#57306](#))
- Passing a string that was not null-terminated to `UpdateXML()` or `ExtractValue()` caused the server to fail with an assertion. ([Bug#57279](#))
- `SET GLOBAL debug` could cause a crash on Solaris if the server failed to open the trace file. ([Bug#57274](#))
- In debug builds, an assertion could be raised during conversion of strings to floating-point values. ([Bug#57203](#))
- If the `file_name` argument to the `--defaults-file` or `--defaults-extra-file` option was not a full path name, it could be interpreted incorrectly in some contexts and cause a server crash. Now the `file_name` argument is interpreted as relative to the current working directory if given as a relative path name rather than as a full path name. ([Bug#57108](#))
- A user with no privileges on a stored routine or the `mysql.proc` table could discover the routine's existence. ([Bug#57061](#))
- Queries executed using the Index Merge access method and a temporary file could return incorrect results. ([Bug#56862](#))
- The server could crash inside `memcpy()` when reading certain Performance Schema tables. ([Bug#56761](#), [Bug#58003](#))
- The server could crash as a result of accessing freed memory when populating `INFORMATION_SCHEMA.VIEWS` if a view could not be opened properly. ([Bug#56540](#))
- Valgrind warnings about overlapping memory when double-assigning the same variable were corrected. ([Bug#56138](#))
- If a `STOP SLAVE` statement was issued while the slave SQL thread was executing a statement that invoked the `SLEEP()` function, both statements hung. ([Bug#56096](#))
- `OPTIMIZE TABLE` for `InnoDB` tables could raise an assertion. ([Bug#55930](#))
- Warnings raised by a trigger were not cleared upon successful completion. Now warnings are cleared if the trigger completes successfully, per the SQL standard. ([Bug#55850](#))
- For `CMake` builds, some parts of the source were unnecessarily compiled twice if the embedded server was built. ([Bug#55647](#))
- In debug builds, an assertion could be raised if a `send_eof()` method was called after an error occurred. ([Bug#54812](#))
- Boolean command options caused an error if given with an option value and the `loose-` option prefix. ([Bug#54569](#))
- An error in a stored procedure could leave the session in a different default database. ([Bug#54375](#))
- The `CMake` “wrapper” for `configure(configure.pl)` did not handle the `--with-comment` option properly. ([Bug#52275](#))
- Grouping by a `TIME_TO_SEC()` function result could cause a server crash or incorrect results. Grouping by a function returning a `BLOB` could cause an unexpected “Duplicate entry” error and incorrect result. ([Bug#52160](#))
- The `find_files()` function used by `SHOW` statements performed redundant and unnecessary memory allocation. ([Bug#51208](#))
- The Windows sample option files contained values more appropriate for Linux. ([Bug#50021](#))
- A failed `RENAME TABLE` operation could prevent a `FLUSH TABLES WITH READ LOCK` from completing. ([Bug#47924](#))
- Error messages for several delegate-related initialization error conditions that should not occur were changed to help identify the area of failure and to instruct the user to file a bug report if they do occur. A delegate is a set of internal data structures and algorithms. ([Bug#47027](#))
- On file systems with case insensitive file names, and `lower_case_table_names=2`, the server could crash due to a table definition cache inconsistency. ([Bug#46941](#))
- Handling of host name lettercase in `GRANT` statements was inconsistent. ([Bug#36742](#))
- `SET NAMES utf8 COLLATE utf8_sinhala_ci` did not work. ([Bug#26474](#))
- The `utf16_bin` collation uses code-point order, not byte-by-byte order, as described at [Section 9.1.14.1, “Unicode Character Sets”](#). (The order was byte-by-byte in MySQL 5.5.7.)

D.1.4. Changes in MySQL 5.5.7 (14 October 2010)

Authentication Changes:

- MySQL authentication supports two new capabilities, pluggable authentication and proxy users:
 - With pluggable authentication, the server can use plugins to authenticate incoming client connections, and clients can load an authentication plugin that interacts properly with the corresponding server plugin. This capability enables clients to connect to the MySQL server with credentials that are appropriate for authentication methods other than the built-in MySQL authentication based on native MySQL passwords stored in the `mysql.user` table. For example, plugins can be created to use external authentication methods such as LDAP, Kerberos, PAM, or Windows login IDs.
 - Proxy user capability enables a client who connects and authenticates as one user to be treated, for purposes of access control while connected, as having the privileges of a different user. In effect, one user impersonates another. Proxy capability depends on pluggable authentication because it is based on having an authentication plugin return to the server the user name that the connecting user impersonates.

Pluggable authentication entails these changes:

- For user specifications in the `CREATE USER` and `GRANT` statements, a new `IDENTIFIED WITH` clause for specifying the authentication plugin.
- For the `mysql.user` table, new columns that specify plugin information. The `plugin` column, if nonempty, indicates which plugin authenticates connections for an account. The `authentication_string` column is a string that is passed to the plugin.
- For the `mysql_options()` C API function, new `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options that enable client programs to load authentication plugins.
- For the `mysql` client, new `--default-auth` and `--plugin-dir` options for specifying which authentication plugin and plugin directory to use.
- For the `mysqltest` client, a new `--plugin-dir` option for specifying which plugin directory to use, and a new `connect()` command argument to specify an authentication plugin.
- For the server plugin API, a new `MYSQL_AUTHENTICATION_PLUGIN` plugin type.
- A client plugin API that enables client programs to manage plugins.
- Reimplementation of the built-in authentication methods previously supported in MySQL as plugins. These methods provide native password checking and pre-MySQL 4.1.1 authentication that uses shorter password hash values. This change only reimplements the built-in methods as plugins that cannot be unloaded. Existing clients authenticate as before with no changes needed. In particular, starting the server with the `--secure-auth` option still prevents clients that have pre-4.1.1 password hashes from connecting, and `--skip-grant-tables` still disables all password checking.

Proxy user capability entails these changes:

- A new `PROXY` privilege that can be managed with the `GRANT` and `REVOKE` statements.
- New `proxy_user` and `external_user` system variables that indicate whether the current session uses proxying.
- A new `mysql.proxies_priv` grant table that records proxy information for MySQL accounts.

Due to these changes, the server requires that a new grant table, `proxies_priv`, be present in the `mysql` database. If you are upgrading to MySQL 5.5.7 from a previous MySQL release rather than performing a new installation, the server will find that this table is missing and exit during startup with the following message:

```
Table 'mysql.proxies_priv' doesn't exist
```

To create the `proxies_priv` table, start the server with the `--skip-grant-tables` option to cause it to skip the normal grant table checks, then run `mysql_upgrade`. For example:

```
shell> mysqld --skip-grant-tables &
shell> mysql_upgrade
```

Then stop the server and restart it normally.

You can specify other options on the `mysqld` command line if necessary. Alternatively, if your installation is configured so that the server normally reads options from an option file, use the `--defaults-file` option to specify the file (enter each command on a single line):

```
shell> mysqld --defaults-file=/usr/local/mysql/etc/my.cnf
      --skip-grant-tables &
shell> mysql_upgrade
```

With the `--skip-grant-tables` option, the server does no password or privilege checking, so any client can connect and effectively have all privileges. For additional security, use the `--skip-networking` option as well to prevent remote clients from connecting.

Note

The upgrade problem just described is fixed in MySQL 5.5.8. the server treats a missing `proxies_priv` table as equivalent to an empty table.

For additional information, consult these references:

- Information about pluggable authentication, including installation and usage instructions: [Section 5.5.6, “Pluggable Authentication”](#).
- Information about proxy users: [Section 5.5.7, “Proxy Users”](#).
- Information about the server and client plugin API: [Section 23.2.4, “Plugin Data Structures and Functions”](#).
- Information about the C API functions for managing client plugins: See [Section 22.9.10, “C API Client Plugin Functions”](#).

Functionality added or changed:

- The unused and undocumented `thread_pool_size` system variable was removed. ([Bug#57338](#))
- The `pstack` library was nonfunctional and has been removed, along with the `--with-pstack` option for `configure` and the `--enable-pstack` option for `mysqld`. ([Bug#57210](#))
- Added a new `SHOW PROCESSLIST` state, `Waiting for query cache lock`. This indicates that a session is waiting to take the query cache lock while it performs some query cache operation. ([Bug#56822](#))
- A new status variable, `Handler_read_last`, displays the number of requests to read the last key in an index. With `ORDER BY`, the server will issue a first-key request followed by several next-key requests, whereas with `ORDER BY DESC`, the server will issue a last-key request followed by several previous-key requests. ([Bug#52312](#))
- MySQL releases are now built using `CMake` rather than the GNU autotools. Accordingly, the instructions for installing MySQL from source have been updated to discuss how to build MySQL using `CMake`. See [Section 2.9, “Installing MySQL from Source”](#). If you are familiar with autotools but not `CMake`, you might find this transition document helpful: http://forge.mysql.com/wiki/Autotools_to_CMake_Transition_Guide

The build process is now similar enough on all platforms, including Windows, that there are no longer sections dedicated to notes for specific platforms.

The default layout when compiling from source now matches that used for binary distributions. You will notice these differences for source installations:

- `mysqld` is installed in `bin`, not `libexec`.
- `mysql_install_db` is installed in `scripts`, not `bin`.
- The data directory is `data`, not `var`.

The `make_binary_distribution` and `make_win_bin_dist` scripts are now obsolete. To create a binary distribution, use `make package`.

Bugs fixed:

- **Performance: InnoDB Storage Engine:** The master InnoDB background thread could sometimes cause transient performance drops due to excessive flushing of modified pages. ([Bug#56933](#))
- **InnoDB Storage Engine: Incompatible Change: Security Fix:** Issuing `TRUNCATE TABLE` and examining the same table's information in the `INFORMATION_SCHEMA` database at the same time could cause a crash in the debug version of the server.

As a result of this change, InnoDB always uses the fast truncation technique, equivalent to `DROP TABLE` and `CREATE TA-`

BLE. It no longer performs a row-by-row delete for tables with parent-child foreign key relationships. `TRUNCATE TABLE` returns an error for such tables. Modify your SQL to issue `DELETE FROM table_name` for such tables instead. ([Bug#54678](#))

- **Security Fix:** The server crashed for assignment of values of types other than `Geometry` to items of type `GeometryCollection (MultiPoint, MultiCurve, MultiSurface)`. Now the server checks the field type and fails with `bad geometry value` if it detects incorrect parameters. ([Bug#55531](#))
- **Security Fix:** The `CONVERT_TZ()` function crashed the server when the timezone argument was an empty `SET` column value. ([Bug#55424](#))
- **Security Fix:** `EXPLAIN EXTENDED` caused a server crash with some prepared statements. ([Bug#54494](#))
- **Security Fix:** In prepared-statement mode, `EXPLAIN` for a `SELECT` from a derived table caused a server crash. ([Bug#54488](#))
- **Security Fix:** The `PolyFromWKB()` function could crash the server when improper WKB data was passed to the function. ([Bug#51875](#), [CVE-2010-3840](#))
- **Incompatible Change: Replication:** The behavior of `INSERT DELAYED` statements when using statement-based replication has changed as follows:

Previously, when using `binlog_format=STATEMENT`, a warning was issued in the client when executing `INSERT DELAYED`; now, no warning is issued in such cases.

Previously, when using `binlog_format=STATEMENT`, `INSERT DELAYED` was logged as `INSERT DELAYED`; now, it is logged as an `INSERT`, without the `DELAYED` option.

However, when `binlog_format=STATEMENT`, `INSERT DELAYED` continues to be executed as `INSERT` (without the `DELAYED` option). The behavior of `INSERT DELAYED` remains unchanged when using `binlog_format=ROW`: `INSERT DELAYED` generates no warnings, is executed as `INSERT DELAYED`, and is logged using the row-based format.

This change also affects `binlog_format=MIXED`, because `INSERT DELAYED` is no longer considered unsafe. Now, when the logging format is `MIXED`, no switch to row-based logging occurs. This means that the statement is logged as a simple `INSERT` (that is, without the `DELAYED` option), using the statement-based logging format. ([Bug#54579](#))

See also [Bug#56678](#), [Bug#57666](#).

This regression was introduced by [Bug#39934](#).

- **Incompatible Change: HANDLER ... READ** statements that invoke stored functions can cause replication errors. Such statements are now disallowed and result in an `ER_NOT_SUPPORTED_YET` error. ([Bug#54920](#))
- **Incompatible Change:** Previously, if you flushed the logs using `FLUSH LOGS` or `mysqladmin flush-logs` and `mysqld` was writing the error log to a file (for example, if it was started with the `--log-error` option), it renamed the current log file with the suffix `-old`, then created a new empty log file. This had the problem that a second log-flushing operation thus caused the original error log file to be lost unless you saved it under a different name. For example, you could use the following commands to save the file:

```
shell> mysqladmin flush-logs
shell> mv host_name.err-old backup-directory
```

To avoid the preceding file-loss problem, renaming no longer occurs. The server merely closes and reopens the log file. To rename the file, you can do so manually before flushing. Then flushing the logs reopens a new file with the original file name. For example, you can rename the file and create a new one using the following commands:

```
shell> mv host_name.err host_name.err-old
shell> mysqladmin flush-logs
shell> mv host_name.err-old backup-directory
```

([Bug#29751](#))

See also [Bug#56821](#).

- **InnoDB Storage Engine: Replication:** If the master had `innodb_file_per_table=OFF`, `innodb_file_format=Antelope` (and `innodb_strict_mode=OFF`), or both, certain `CREATE TABLE` options, such as `KEY_BLOCK_SIZE`, were ignored. This could allow master to avoid raising `ER_TOO_BIG_ROWSIZE` errors.

However, the ignored `CREATE TABLE` options were still written into the binary log, so that, if the slave had `innodb_file_per_table=ON` and `innodb_file_format=Barracuda`, it could encounter an `ER_TOO_BIG_ROWSIZE` error while executing the record from the log, causing the slave SQL thread to abort and replication to fail.

In the case where the master was running MySQL 5.1 and the slave was MySQL 5.5 (or later), the failure occurred when both master and slave were running with default values for `innodb_file_per_table` and `innodb_file_format`. This could cause problems during upgrades.

To address this issue, the default values for `innodb_file_per_table` and `innodb_file_format` are reverted to the MySQL 5.1 default values—that is, `OFF` and `Antelope`, respectively. ([Bug#56318](#))

- **InnoDB Storage Engine:** The server could crash with a high volume of concurrent `LOCK TABLES` and `UNLOCK TABLES` statements. ([Bug#57345](#))
- **InnoDB Storage Engine:** `InnoDB` incorrectly reported an error when a cascading foreign key constraint deleted more than 250 rows. ([Bug#57255](#))
- **InnoDB Storage Engine:** If the server crashed during an `ALTER TABLE` operation on an `InnoDB` table, examining the table through `SHOW CREATE TABLE` or querying the `INFORMATION_SCHEMA` tables could cause the server to stop with an assertion error. ([Bug#56982](#))
- **InnoDB Storage Engine:** The output from the `SHOW ENGINE INNODB STATUS` command can now be up to 1 MB. Formerly, it was truncated at 64 KB. Monitoring applications that parse can check if output exceeds this new, larger limit by testing the `Innodb_truncated_status_writes` status variable. ([Bug#56922](#))
- **InnoDB Storage Engine:** A `SELECT ... FOR UPDATE` statement affecting a range of rows in an `InnoDB` table could cause a crash in the debug version of the server. ([Bug#56716](#))
- **InnoDB Storage Engine:** Improved the performance of `UPDATE` operations on `InnoDB` tables, when only non-indexed columns are changed. ([Bug#56340](#))
- **InnoDB Storage Engine:** When MySQL was restarted after a crash with the option `innodb_force_recovery=6`, certain queries against `InnoDB` tables could fail, depending on `WHERE` or `ORDER BY` clauses.

Usually in such a disaster recovery situation, you dump the entire table using a query without these clauses. During advanced troubleshooting, you might use queries with these clauses to diagnose the position of the corrupted data, or to recover data following the corrupted part. ([Bug#55832](#))

- **InnoDB Storage Engine:** The `CHECK TABLE` command could cause a time-consuming verification of the `InnoDB` adaptive hash index memory structure. Now this extra checking is only performed in binaries built for debugging. ([Bug#55716](#))
- **InnoDB Storage Engine:** A heavy workload with a large number of threads could cause a crash in the debug version of the server. ([Bug#55699](#))
- **InnoDB Storage Engine:** The server could crash on shutdown, if started with `--innodb-use-system-malloc=0`. ([Bug#55627](#))
- **InnoDB Storage Engine:** If the server crashed during a `RENAME TABLE` operation on an `InnoDB` table, subsequent crash recovery could fail. This problem could also affect an `ALTER TABLE` statement that caused a rename operation internally. ([Bug#55027](#))
- **InnoDB Storage Engine:** Setting the `PACK_KEYS=0` table option for an `InnoDB` table prevented new indexes from being added to the table. ([Bug#54606](#))
- **InnoDB Storage Engine:** The server could crash when opening an `InnoDB` table linked through foreign keys to a long chain of child tables. ([Bug#54582](#))
- **InnoDB Storage Engine:** Changed the locking mechanism for the `InnoDB` data dictionary during `ROLLBACK` operations, to improve concurrency for `REPLACE` statements. ([Bug#54538](#))
- **InnoDB Storage Engine:** With multiple buffer pools enabled, `InnoDB` could flush more data from the buffer pool than necessary, causing extra I/O overhead. ([Bug#54346](#))
- **InnoDB Storage Engine:** `InnoDB` transactions could be incorrectly committed during recovery, rather than rolled back, if the server crashed and was restarted after performing `ALTER TABLE...ADD PRIMARY KEY` on an `InnoDB` table, or some other operation that involves copying the entire table. ([Bug#53756](#))
- **InnoDB Storage Engine:** `InnoDB` startup messages now include the start and end times for buffer pool initialization, and the total buffer pool size. ([Bug#48026](#))
- **Partitioning:** An `ALTER TABLE` statement acting on table partitions that failed while the affected table was locked could cause the server to crash. ([Bug#56172](#))
- **Partitioning:** Multi-table `UPDATE` statements involving a partitioned `MyISAM` table could cause this table to become corrup-

ted. Not all tables affected by the `UPDATE` needed to be partitioned for this issue to be observed. ([Bug#55458](#))

- **Partitioning:** `EXPLAIN PARTITIONS` returned bad estimates for range queries on partitioned `MyISAM` tables. In addition, values in the `rows` column of `EXPLAIN PARTITIONS` output did not take partition pruning into account. ([Bug#53806](#), [Bug#46754](#))

- **Replication:** `SET PASSWORD` caused row-based replication to fail between a MySQL 5.1 master and a MySQL 5.5 slave.

This fix makes it possible to replicate `SET PASSWORD` correctly, using row-based replication between a master running MySQL 5.1.53 or a later MySQL 5.1 release to a slave running MySQL 5.5.7 or a later MySQL 5.5 release. ([Bug#57098](#))

See also [Bug#55452](#), [Bug#57357](#).

- **Replication:** Prepared multiple-row `INSERT DELAYED` statements were written to the binary log without `DELAYED`. ([Bug#56678](#))

- **Replication:** Backticks used to enclose identifiers for savepoints were not preserved in the binary log, which could lead to replication failure when the identifier, stripped of backticks, could be misinterpreted, causing a syntax or other error.

This could cause problems with MySQL application programs making use of generated savepoint IDs. If, for instance, `java.sql.Connection.setSavepoint()` is called without any parameters, Connector/J automatically generates a savepoint identifier consisting of a string of hexadecimal digits `0-F` encased in backtick (`) characters. If such an ID took the form ``NeN`` (where `N` represents a string of the decimal digits `0-9`, and `e` is a literal uppercase or lowercase “E” character). Removing the backticks when writing the identifier into the binary log left behind a substring which the slave MySQL server tried to interpret as a floating point number, rather than as an identifier. The resulting syntax error caused loss of replication. ([Bug#55961](#))

See also [Bug#55962](#).

- **Replication:** When a slave tried to execute a transaction larger than the slave's value for `max_binlog_cache_size`, it crashed. This was caused by an assertion that the server should roll back only the statement but not the entire transaction when the error `ER_TRANS_CACHE_FULL` occurred. However, the slave SQL thread always rolled back the entire transaction whenever any error occurred, regardless of the type of error. ([Bug#55375](#))

- **Replication:** The error message for `ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE` was hard coded in English in `sql_yacc.yy`, so that it could not be translated in `errmsg.txt` for other languages.

Additionally, this same error message was used for three separate error conditions:

1. When the heartbeat period exceeded the value of `slave_net_timeout`.
2. When the heartbeat period was nonnegative but shorter than 1 millisecond.
3. When the value for the heartbeat period was either negative or greater than the maximum allowed.

These issues have been addressed as follows:

- By using three distinct error messages for each of the conditions listed previously.
- By moving the sources for these error messages into the `errmsg-utf8.txt` file to facilitate translations into languages other than English.

([Bug#54144](#))

- A buffer overrun could occur when formatting `DBL_MAX` numbers. ([Bug#57209](#))
- `COALESCE()` in MySQL 5.5 could return a result different from MySQL 5.1 for some arguments. ([Bug#57095](#))
- Constant `SUBTIME()` expressions could return incorrect results. ([Bug#57039](#))
- When `mysqld` was started as a service on Windows and `mysqld` was writing the error log to a file (for example, if it was started with the `--log-error` option), the server reassign the file descriptors of the `stdout` and `stderr` streams to the file descriptor of the log file. On Windows, if `stdout` or `stderr` is not associated with an output stream, the file descriptor returns a negative value. Previously, this would cause the file descriptor reassignment to fail and the server to abort. To avoid this problem on Windows, `stdout` and `stderr` streams are now first assigned to the log file stream by opening this file. This causes `stdout` and `stderr` file descriptors to be nonzero and the server can successfully reassign them to the file descriptor of the log file. ([Bug#56821](#))
- The server could crash inside `memcpy()` when reading certain Performance Schema tables. ([Bug#56761](#), [Bug#58003](#))
- Deadlock could occur for a workload consisting of a mix of DML, DDL, and `FLUSH TABLES` statements affecting the same

set of tables in a heavily concurrent environment. ([Bug#56715](#), [Bug#56404](#))

- Memory leaks detected by Valgrind were corrected. ([Bug#56709](#))
- On Mac OS X, `RENAME TABLE` raised an assertion if the `lower_case_table_names` system variable was 2 and the old table name was specified in uppercase. ([Bug#56595](#))
- Performance for certain read-only queries, in particular `point_select`, had deteriorated compared to previous versions. ([Bug#56585](#))
- It was possible to compile `mysqld` with Performance Schema support but with a dummy atomic-operations implementation, which caused a server crash. This problem does not affect binary distributions. It is helpful as a safety measure for users who build MySQL from source. ([Bug#56521](#))
- Executing `XA END` after an XA transaction was already ended raised an assertion. ([Bug#56448](#))
- A `SELECT` statement could produce a different number of rows than a `CREATE TABLE ... SELECT` that was supposed to select the same rows. ([Bug#56423](#))
- The server crashed if a table maintenance statement such as `ANALYZE TABLE` or `REPAIR TABLE` was executed on a `MERGE` table and opening and locking a child table failed. For example, this could happen if a child table did not exist or if a lock timeout happened while waiting for a conflicting metadata lock to disappear.

As a consequence of this bug fix, it is now possible to use `CHECK TABLE` for log tables without producing an error. ([Bug#56422](#), [Bug#56494](#))

- Deadlock could occur for heavily concurrent workloads consisting of a mix of DML, DDL, and `FLUSH TABLES` statements affecting the same set of tables. ([Bug#56405](#))
- `ALTER TABLE` on a `MERGE` table could result in deadlock with other connections. ([Bug#56292](#), [Bug#57002](#))
- Comparison of one `STR_TO_DATE()` result with another could return incorrect results. ([Bug#56271](#))
- The `tcmalloc` library was missing from binary MySQL packages for Linux. ([Bug#56267](#))
- An `INSERT DELAYED` statement for a `MERGE` table could cause deadlock if it occurred as part of a transaction or under `LOCK TABLES`, and there was a concurrent DDL or `LOCK TABLES ... WRITE` statement that tried to lock one of its underlying tables. ([Bug#56251](#))
- In debug builds, the server raised an assertion for `DROP DATABASE` in installations that had an outdated or corrupted `mysql.proc` table. For example, this affected `mysql_upgrade` when run as part of a MySQL 5.1 to 5.5 upgrade. ([Bug#56137](#))
- A negative `TIME` argument to `MIN()` or `MAX()` could raise an assertion. ([Bug#56120](#))
- The ordering for supplementary characters with the `utf8mb4_bin`, `utf16_bin`, and `utf32_bin` collations was incorrect. ([Bug#55980](#))
- On Solaris with `gcc 3.4.6`, `ha_example.so` was built with DTrace support even if the server was not, causing plugin loading problems. ([Bug#55966](#))
- Short (single-letter) command-line options did not work. ([Bug#55873](#))
- If a query specified a `DATE` or `DATETIME` value in a format different from '`YYYY-MM-DD HH:MM:SS`', a greater-than-or-equal (`>=`) condition matched only greater-than values in an indexed `TIMESTAMP` column. ([Bug#55779](#))
- If a view was named as the destination table for `CREATE TABLE ... SELECT`, the server produced a warning whether or not `IF NOT EXISTS` was used. Now it produces a warning only when `IF NOT EXISTS` is used, and an error otherwise. ([Bug#55777](#))
- `CASE` expressions with a mix of operands in different character sets sometimes returned incorrect results. ([Bug#55744](#))
- After the fix for [Bug#39653](#), the shortest available secondary index was used for full table scans. The primary clustered key was used only if no secondary index could be used. However, when the chosen secondary index includes all columns of the table being scanned, it is better to use the primary index because the amount of data to scan is the same but the primary index is clustered. This is now taken into account. ([Bug#55656](#))
- The server entered an infinite loop with high CPU utilization after an error occurred during flushing of the IO cache. ([Bug#55629](#))
- For Performance Schema, the default number of rwlock classes was increased to 30, and the default number of rwlock and mu-

tex instances was increased to 1 million. These changes were made to account for the volume of data instrumented when the `InnoDB` storage engine is used (because of the `InnoDB` buffer pool). ([Bug#55576](#))

- If there was an active `SELECT` statement, an error arising during trigger execution could cause a server crash. ([Bug#55421](#))
- Assignment of `InnoDB` scalar subquery results to a variable resulted in unexpected `S` locks in `READ COMMITTED` transaction isolation level. ([Bug#55382](#))
- In debug builds, `FLUSH TABLE table_list WITH READ LOCK` for a `MERGE` table led to an assertion failure if one of the table's children was not present in the list of tables to be flushed. ([Bug#55273](#))
- The server could crash during shutdown due to a race condition relating to Performance Schema cleanup. ([Bug#55105](#), [Bug#56324](#))
- Queries involving predicates of the form `const NOT BETWEEN not_indexed_column AND indexed_column` could return incorrect data due to incorrect handling by the range optimizer. ([Bug#54802](#))
- With an `UPDATE IGNORE` statement including a subquery that was evaluated using a temporary table, an error transferring the data from the temporary was ignored, causing an assertion to be raised. ([Bug#54543](#))
- A bad `DBUG_PRINT` statement in `fill_schema_schemata()` caused server crashes on Solaris. ([Bug#54478](#))
- `MIN()` or `MAX()` with a subquery argument could raise a debug assertion for debug builds or return incorrect data for nondebug builds. ([Bug#54465](#))
- If one session attempted to drop a database containing a table which another session had opened with `HANDLER`, any instance of `ALTER DATABASE`, `CREATE DATABASE`, or `DROP DATABASE` issued by the latter session produced a deadlock. ([Bug#54360](#))
- `INFORMATION_SCHEMA` plugins with no `deinit()` method resulted in a memory leak. ([Bug#54253](#))
- Row subqueries producing no rows were not handled as `UNKNOWN` values in row comparison expressions. ([Bug#54190](#))
- Setting `SETUP_INSTRUMENTS.TIMER = 'NO'` caused `TIMER_WAIT` values for aggregations to be `NULL` rather than 0. ([Bug#53874](#))
- The `max_length` metadata value of `MEDIUMBLOB` types was reported as 1 byte greater than the correct value. ([Bug#53296](#))
- If an application using the embedded server called `mysql_library_init()` a second time after calling `mysql_library_init()` and `mysql_library_end()` to start and stop the server, the application crashed when reading option files. ([Bug#53251](#))
- The fix for [Bug#30234](#) caused the server to reject the `DELETE tbl_name.* . . .` Access compatibility syntax for multiple-table `DELETE` statements. ([Bug#53034](#))
- The `plugin_ftparser.h` and `plugin_audit.h` include files are part of the public API/ABI, but were not tested by the ABI check. ([Bug#52821](#))
- An atomic “compare and swap” operation using x86 assembly code (32 bit) could access incorrect data, which would make it work incorrectly and lose the intended atomicity. This would in turn cause the MySQL server to work on inconsistent data structures and return incorrect data. That code part affected only 32-bit builds; the effect has been observed when `icc` was used to build binaries. With `gcc`, no incorrect results have been observed during tests, so this fix is a proactive one. Other compilers do not use this assembly code. ([Bug#52419](#))
- In `LOAD DATA INFILE`, using a `SET` clause to set a column equal to itself caused a server crash. ([Bug#51850](#))
- An assertion could be raised by `DELETE` on a view that referenced another view which in turn (directly or indirectly) referenced more than one table. ([Bug#51099](#))
- In some cases, when the left part of a `NOT IN` subquery predicate was a row and contained `NULL` values, the query result was incorrect. ([Bug#51070](#))
- `CHECKSUM TABLE` for Performance Schema tables could cause a server crash due to uninitialized memory reads. ([Bug#50557](#))
- For some queries, the optimizer produced incorrect results using the Index Merge access method with `InnoDB` tables. ([Bug#50402](#))
- `EXPLAIN` produced an incorrect `rows` value for queries evaluated using an index scan and that included `LIMIT`, `GROUP BY`, and `ORDER BY` on a computed column. ([Bug#50394](#))

- `mysql_store_result()` and `mysql_use_result()` are not for use with prepared statements and are not intended to be called following `mysql_stmt_execute()`, but failed to return an error when invoked that way. ([Bug#47485](#))
- Using `REPAIR TABLE table USE_FRM` on a `MERGE` table caused the server to crash. ([Bug#46339](#))
- If the global and session `debug` system variables had the same value, the debug trace file could be closed twice, leading to freeing already freed memory and a server crash. ([Bug#46165](#))
- If `ALTER EVENT` failed to load an event after altering it, an assertion could be raised. This could occur, for example, if `ALTER EVENT` was killed with `KILL QUERY`. ([Bug#44171](#))
- Trailing space removal for `utf32` strings was done with non-multibyte-safe code, leading to incorrect result length and assertion failure. ([Bug#42511](#))
- A malformed packet sent by the server when the query cache was in use resulted in lost-connection errors. ([Bug#42503](#))
- Multiple-statement execution could fail. ([Bug#40877](#))
- `CREATE TABLE` failed if a column referred to in an index definition and foreign key definition was in different lettercases in the two definitions. ([Bug#39932](#))
- `mysqlcheck` behaved differently depending on the order in which options were given on the command line. ([Bug#35269](#))
- When invoked to display a help message, `mysqld` also displayed spurious warning or error messages. ([Bug#30025](#))

D.1.5. Changes in MySQL 5.5.6 (13 September 2010 Release Candidate)

Functionality added or changed:

- **Incompatible Change:** The `SHA2()` function now returns a character string with the connection character set and collation. Previously, it returned a binary string. This is the same change made for several other encryption functions in MySQL 5.5.3. ([Bug#54661](#))
- Previously, `MySQL-shared-compat` RPMs for Linux contained both the current and previous client library versions for the target platform. Thus, the package contents overlapped with `MySQL-shared` RPMs, which contain only the current client library version. This can result in problems in two cases:
 - When the `MySQL-shared` RPM is installed but later it is determined that the `MySQL-shared-compat` RPM is needed (an application is installed that was linked against an older client library). Installing the `MySQL-shared-compat` RPM results in a conflict because both include the current library version. This can be overcome by using the `--force` option to RPM, or by first uninstalling the `MySQL-shared` RPM (which breaks dependencies).
 - When the `MySQL-shared-compat` RPM is installed, but old applications that require it are removed or upgraded to the current library version. In this case, `MySQL-shared-compat` cannot be replaced with `MySQL-shared` as long as current applications are installed. This can be overcome by using the `--force` option to RPM, which incurs the risk of breaking dependencies.

Now the `MySQL-shared-compat` RPMs include only older client library versions and no longer include the current version, so that the `MySQL-shared` and `MySQL-shared-compat` RPM contents no longer overlap. The `MySQL-shared-compat` RPM can be installed even if the `MySQL-shared` RPM is installed, without producing conflicts related to the current library version. The `MySQL-shared-compat` RPM can be uninstalled when old applications are removed or upgraded to the current library version, without breaking applications that already use the current library version.

If you previously installed the `MySQL-shared-compat` RPM because you needed both the current and previous libraries, you should install both the `MySQL-shared` and `MySQL-shared-compat` RPMs now. ([Bug#56150](#))

- Overhead for the Performance Schema interface was reduced. ([Bug#55087](#))
- Within stored programs, `LIMIT` clauses now accept integer-valued routine parameters or local variables as parameters. ([Bug#11918](#))
- Code was removed for the following no-longer-supported platforms: NetWare, MS-DOS, VMS, QNX, and 32-bit SPARC.

Bugs fixed:

- **Performance: InnoDB Storage Engine:** The setting `innodb_change_buffering=all` could produce slower performance for some operations than the previous default, `innodb_change_buffering=inserts`. ([Bug#54914](#))

- **Performance: InnoDB Storage Engine:** An `EXPLAIN` plan for an `InnoDB` table could vary greatly in the estimated cost for a `BETWEEN` clause. ([Bug#53761](#))
- **InnoDB Storage Engine: Security Fix:** After changing the values of the `innodb_file_format` or `innodb_file_per_table` configuration parameters, DDL statements could cause a server crash. ([Bug#55039](#), [CVE-2010-3676](#))
- **Security Fix: Replication:** It was possible when using statement-based replication to subvert the MySQL privilege system on a slave with a higher server release version number than that of the master by using version-specific comments in statements run on the master. ([Bug#49124](#))
- **Security Fix:** During evaluation of arguments to extreme-value functions (such as `LEAST()` and `GREATEST()`), type errors did not propagate properly, causing the server to crash. ([Bug#55826](#), [CVE-2010-3833](#))
- **Security Fix:** The server could crash after materializing a derived table that required a temporary table for grouping. ([Bug#55568](#), [CVE-2010-3834](#))
- **Security Fix:** A user-variable assignment expression that is evaluated in a logical expression context can be precalculated in a temporary table for `GROUP BY`. However, when the expression value is used after creation of the temporary table, it was re-evaluated, not read from the table and a server crash resulted. ([Bug#55564](#), [CVE-2010-3835](#))
- **Security Fix:** Joins involving a table with a unique `SET` column could cause a server crash. ([Bug#54575](#), [CVE-2010-3677](#))
- **Security Fix:** Pre-evaluation of `LIKE` predicates during view preparation could cause a server crash. ([Bug#54568](#), [CVE-2010-3836](#))
- **Security Fix:** Incorrect handling of `NULL` arguments could lead to a crash for `IN()` or `CASE` operations when `NULL` arguments were either passed explicitly as arguments (for `IN()`) or implicitly generated by the `WITH ROLLUP` modifier (for `IN()` and `CASE`). ([Bug#54477](#), [CVE-2010-3678](#))
- **Security Fix:** `GROUP_CONCAT()` and `WITH ROLLUP` together could cause a server crash. ([Bug#54476](#), [CVE-2010-3837](#))
- **Security Fix:** Queries could cause a server crash if the `GREATEST()` or `LEAST()` function had a mixed list of numeric and `LONGBLOB` arguments, and the result of such a function was processed using an intermediate temporary table. ([Bug#54461](#), [CVE-2010-3838](#))
- **Security Fix:** A malformed argument to the `BINLOG` statement could result in Valgrind warnings or a server crash. ([Bug#54393](#), [CVE-2010-3679](#))
- **Security Fix:** After `ALTER TABLE` was used on a temporary transactional table locked by `LOCK TABLES`, any later attempts to execute `LOCK TABLES` or `UNLOCK TABLES` caused a server crash. ([Bug#54117](#))
- **Security Fix:** Use of `TEMPORARY InnoDB` tables with nullable columns could cause a server crash. ([Bug#54044](#), [CVE-2010-3680](#))
- **Security Fix:** Queries with nested joins could cause an infinite loop in the server when used from stored procedures and prepared statements. ([Bug#53544](#), [CVE-2010-3839](#))
- **Security Fix:** Using `EXPLAIN` with queries of the form `SELECT ... UNION ... ORDER BY (SELECT ... WHERE ...)` could cause a server crash. ([Bug#52711](#), [CVE-2010-3682](#))
- **Incompatible Change: Replication:** As of MySQL 5.5.6, handling of `CREATE TABLE IF NOT EXISTS ... SELECT` statements has been changed for the case that the destination table already exists:
 - Previously, for `CREATE TABLE IF NOT EXISTS ... SELECT`, MySQL produced a warning that the table exists, but inserted the rows and wrote the statement to the binary log anyway. By contrast, `CREATE TABLE ... SELECT` (without `IF NOT EXISTS`) failed with an error, but MySQL inserted no rows and did not write the statement to the binary log.
 - MySQL now handles both statements the same way when the destination table exists, in that neither statement inserts rows or is written to the binary log. The difference between them is that MySQL produces a warning when `IF NOT EXISTS` is present and an error when it is not.

This change in handling of `IF NOT EXISTS` results in an incompatibility for statement-based replication from a MySQL 5.1 master with the original behavior and a MySQL 5.5 slave with the new behavior. Suppose that `CREATE TABLE IF NOT EXISTS ... SELECT` is executed on the master and the destination table exists. The result is that rows are inserted on the master but not on the slave. (Row-based replication does not have this problem.)

To address this issue, statement-based binary logging for `CREATE TABLE IF NOT EXISTS ... SELECT` is changed in MySQL 5.1 as of 5.1.51:

- If the destination table does not exist, there is no change: The statement is logged as is.
- If the destination table does exist, the statement is logged as the equivalent pair of `CREATE TABLE IF NOT EXISTS` and `INSERT ... SELECT` statements. (If the `SELECT` in the original statement is preceded by `IGNORE` or `REPLACE`, the `INSERT` becomes `INSERT IGNORE` or `REPLACE`, respectively.)

This change provides forward compatibility for statement-based replication from MySQL 5.1 to 5.5 because when the destination table exists, the rows will be inserted on both the master and slave. To take advantage of this compatibility measure, the 5.1 server must be at least 5.1.51 and the 5.5 server must be at least 5.5.6.

To upgrade an existing 5.1-to-5.5 replication scenario, upgrade the master first to 5.1.51 or higher. Note that this differs from the usual replication upgrade advice of upgrading the slave first.

A workaround for applications that wish to achieve the original effect (rows inserted regardless of whether the destination table exists) is to use `CREATE TABLE IF NOT EXISTS` and `INSERT ... SELECT` statements rather than `CREATE TABLE IF NOT EXISTS ... SELECT` statements.

Along with the change just described, the following related change was made: Previously, if an existing view was named as the destination table for `CREATE TABLE IF NOT EXISTS ... SELECT`, rows were inserted into the underlying base table and the statement was written to the binary log. As of MySQL 5.1.51 and 5.5.6, nothing is inserted or logged. ([Bug#47442](#), [Bug#47132](#), [Bug#48814](#), [Bug#49494](#))

- **Incompatible Change:** Several changes were made to Performance Schema tables:

- The `SETUP_OBJECTS` table was removed.
- The `PROCESSLIST` table was renamed to `THREADS`.
- The `EVENTS_WAITS_SUMMARY_BY_EVENT_NAME` table was renamed to `EVENTS_WAITS_SUMMARY_GLOBAL_BY_EVENT_NAME`.

([Bug#55416](#))

- **Incompatible Change:** Handling of warnings and errors during stored program execution was problematic:

- If one statement generated several warnings or errors, only the handler for the first was activated, even if another might be more appropriate.
- Warning or error information could be lost.

([Bug#36185](#), [Bug#5889](#), [Bug#9857](#), [Bug#23032](#))

- **Incompatible Change:** If the server was started with `character_set_server` set to `utf16`, it crashed during full-text stopword initialization. Now the stopword file is loaded and searched using `latin1` if `character_set_server` is `ucs2`, `utf16`, or `utf32`. If any table was created with `FULLTEXT` indexes while the server character set was `ucs2`, `utf16`, or `utf32`, it should be repaired using this statement:

```
REPAIR TABLE tbl_name QUICK;
```

([Bug#32391](#))

- **Important Change: Replication:** The `LOAD DATA INFILE` statement is now considered unsafe for statement-based replication. When using statement-based logging mode, the statement now produces a warning; when using mixed-format logging, the statement is made using the row-based format. ([Bug#34283](#))

- **InnoDB Storage Engine:** An assertion was raised if (1) an `InnoDB` table was created using `CREATE TABLE ... SELECT` where the query used an `INFORMATION_SCHEMA` table and a view existed in the database; or (2) any statement that modified an `InnoDB` table had a subquery referencing an `INFORMATION_SCHEMA` table. ([Bug#55973](#))

- **InnoDB Storage Engine:** The `InnoDB` storage engine was not included in the default installation when using the `configure` script. ([Bug#55547](#))

- **InnoDB Storage Engine:** For an `InnoDB` table with an auto-increment column, the server could crash if the first statement that references the table after a server restart is a `SHOW CREATE TABLE` statement. ([Bug#55277](#))

- **InnoDB Storage Engine:** The `mysql_config` tool would not output the requirement for the `aio` library for `mysqld-libs`. ([Bug#55215](#))

- **InnoDB Storage Engine:** Some memory used for `InnoDB` asynchronous I/O was not freed at shutdown. ([Bug#54764](#))

- **InnoDB Storage Engine:** Implementation of the 64-bit `dulint` structure in InnoDB was not optimized for 64-bit processors, resulting in excessive storage and reduced performance. ([Bug#54728](#))
 - **InnoDB Storage Engine:** The output from the `SHOW ENGINE INNODB STATUS` command now includes information about “spin rounds” for RW-locks (both shared and exclusive locks). ([Bug#54726](#))
 - **InnoDB Storage Engine:** An `ALTER TABLE` statement could convert an InnoDB compressed table (with `row_format=compressed`) back to an uncompressed table (with `row_format=compact`). ([Bug#54679](#))
 - **InnoDB Storage Engine:** InnoDB could issue an incorrect message on startup, if tables were created under the setting `innodb_file_per_table=ON`. The message was of the form `InnoDB: Warning: allocated tablespace n, old maximum was 0` and is no longer displayed during restarts after you have upgraded the MySQL server and created at least one InnoDB table with `innodb_file_per_table=ON`. If you continue to encounter this message, you might have corruption in your shared tablespace; if so, back up and reload your data. ([Bug#54658](#))
 - **InnoDB Storage Engine:** The database server could crash when renaming a table that had active transactions. (This issue only affected the database server when built for debugging.) ([Bug#54453](#))
 - **InnoDB Storage Engine:** The server could crash during the recovery phase of startup, if it previously crashed while inserting BLOB or other large columns that use off-page storage into an InnoDB table created with `ROW_FORMAT=REDUNDANT` or `ROW_FORMAT=COMPACT`. ([Bug#54408](#))
 - **InnoDB Storage Engine:** For an InnoDB table created with `ROW_FORMAT=COMPRESSED` or `ROW_FORMAT=DYNAMIC`, a query using the `READ UNCOMMITTED` isolation level could cause the server to stop with an assertion error, if BLOB or other large columns that use off-page storage were being inserted at the same time. ([Bug#54358](#))
 - **InnoDB Storage Engine:** Fast index creation in the InnoDB Plugin could fail, leaving the new secondary index corrupted. ([Bug#54330](#))
 - **InnoDB Storage Engine:** If a session executing `TRUNCATE TABLE` on an InnoDB table was killed during `open_tables()`, an assertion could be raised. ([Bug#53757](#))
 - **InnoDB Storage Engine:** The `Lock_time` field in the slow query log now reports a larger value, including the time for InnoDB lock waits at the statement level. ([Bug#53496](#))
 - **InnoDB Storage Engine:** Misimplementation of the `os_fast_mutex_trylock()` function in InnoDB resulted in unnecessary blocking and reduced performance. ([Bug#53204](#))
 - **InnoDB Storage Engine:** InnoDB could not create tables that used the `utf32` character set. ([Bug#52199](#))
 - **InnoDB Storage Engine:** Performing large numbers of `RENAME TABLE` statements caused excessive memory use. ([Bug#47991](#))
 - **InnoDB Storage Engine:** The mechanism that checks if there is enough space for redo logs was improved, reducing the chance of encountering this message: `ERROR: the age of the last checkpoint is x, which exceeds the log group capacity y.` ([Bug#39168](#))
 - **InnoDB Storage Engine:** Improved performance and scalability on Windows systems, especially for Windows Vista and higher. Re-enabled the use of atomic instructions on Windows systems. For Windows Vista and higher, reduced the number of event handles used. To compile on Windows systems now requires Windows SDK v6.0 or later; either upgrade to Visual Studio 2008 or 2010, or for Visual Studio 2005, install Windows SDK Update for Windows Vista. ([Bug#22268](#))
 - **Partitioning:** With `innodb_thread_concurrency = 1`, `ALTER TABLE ... REORGANIZE PARTITION` and `SELECT` could deadlock. There were unreleased latches in the `ALTER TABLE ... REORGANIZE PARTITION` thread which were needed by the `SELECT` thread to be able to continue. ([Bug#54747](#))
 - **Partitioning:** An `ALTER TABLE ... ADD PARTITION` statement run concurrently with a read lock caused spurious `ER_TABLE_EXISTS` and `ER_NO_SUCH_TABLE` errors on subsequent attempts. ([Bug#53676](#))
- See also [Bug#53770](#).
- **Partitioning:** `UPDATE` and `INSERT` statements affecting partitioned tables performed poorly when using row-based replication. ([Bug#52517](#))
 - **Partitioning:** `INSERT ON DUPLICATE KEY UPDATE` statements performed poorly on tables having many partitions. This was because the handler function for reading a row from a specific index was not optimized in the partitioning handler. ([Bug#52455](#))
 - **Partitioning:** `ALTER TABLE ... TRUNCATE PARTITION`, when called concurrently with transactional DML on the table, was executed immediately and did not wait for the concurrent transaction to release locks. As a result, the `ALTER TABLE` statement was written into the binary log before the DML statement, which led to replication failures when using row-based

logging. ([Bug#49907](#))

See also [Bug#42643](#).

- **Partitioning:** When the storage engine used to create a partitioned table was disabled, attempting to drop the table caused the server to crash. ([Bug#46086](#))
- **Replication:** When using the row-based logging format, a failed `CREATE TABLE ... SELECT` statement was written to the binary log, causing replication to break if the failed statement was later re-run on the master. In such cases, a `DROP TABLE ... IF EXIST` statement is now logged in the event that a `CREATE TABLE ... SELECT` fails. ([Bug#55625](#))
- **Replication:** When using the row-based logging format, a `SET PASSWORD` statement was written to the binary log twice. ([Bug#55452](#))
- **Replication:** When closing temporary tables, after the session connection was already closed, if the writing of the implicit `DROP TABLE` statement into the binary log failed, it was possible for the resulting error to be mishandled, triggering an assertion. ([Bug#55387](#))
- **Replication:** Executing `SHOW BINLOG EVENTS` increased the value of `max_allowed_packet` applying to the session that executed the statement. ([Bug#55322](#))
- **Replication:** Setting `binlog_format = ROW` then creating and then dropping a temporary table led an assertion. ([Bug#54925](#))
- **Replication:** When using mixed-format replication, changes made to a non-transactional temporary table within a transaction were not written into the binary log when the transaction was rolled back. This could lead to a failure in replication if the temporary table was used again afterwards. ([Bug#54872](#))

See also [Bug#53259](#).

- **Replication:** If `binlog_format` was explicitly switched from `STATEMENT` to `ROW` following the creation of a temporary table, then on disconnection the master failed to write the expected `DROP TEMPORARY TABLE` statement into the binary log. As a consequence, temporary tables (and their corresponding files) accumulated as this scenario was repeated. ([Bug#54842](#))

See also [Bug#52616](#).

- **Replication:** If the SQL thread was started while the I/O thread was performing rotation of the relay log, the 2 threads could begin to race for the same I/O cache, leading to a crash of the server. ([Bug#54509](#))

See also [Bug#50364](#).

- **Replication:** Two related issues involving temporary tables and transactions were introduced by a fix made in MySQL 5.1.37:
 1. When a temporary table was created or dropped within a transaction, any failed statement that followed the `CREATE TEMPORARY TABLE` or `DROP TEMPORARY TABLE` statement triggered a rollback, which caused the slave diverge from the master.
 2. When a `CREATE TEMPORARY TABLE ... SELECT * FROM ...` statement was executed within a transaction in which only tables using transactional storage engines were used and the transaction was rolled back at the end, the changes—including the creation of the temporary table—were not written to the binary log.

The current fix restores the correct behavior in both of these cases. ([Bug#53560](#))

This regression was introduced by [Bug#43929](#).

- **Replication:** The value of `binlog_direct_non_transactional_updates` had no effect on statements mixing transactional tables and nontransactional tables, or mixing temporary tables and nontransactional tables.

As part of the fix for this issue, updates to temporary tables are now handled as transactional or nontransactional according to their storage engine types. (In effect, the current fix reverts a change made previously as part of the fix for [Bug#53259](#).)

In addition, unsafe mixed statements (that is, statements which access transactional table as well nontransactional or temporary tables, and write to any of them) are now handled as transactional when the statement-based logging format is in use. ([Bug#53452](#))

See also [Bug#51894](#).

- **Replication:** When `binlog_format=STATEMENT`, any statement that is flagged as being unsafe, possibly causing the slave to go out of sync, generates a warning. This warning is written to the server log, the warning count is returned to the client in the server's response, and the warnings are accessible through `SHOW WARNINGS`.

The current bug affects only the counts for warnings to the client and that are visible through `SHOW WARNINGS`; it does not affect which warnings are written to the log. The current issue came about because the fix for an earlier issue caused warnings for substatements to be cleared whenever a new substatement was started. However, this suppressed warnings for unsafe statements in some cases. Now, such warnings are no longer cleared. ([Bug#50312](#))

This regression was introduced by [Bug#36649](#).

- **Replication:** Replication could break if a transaction involving both transactional and nontransactional tables was rolled back to a savepoint. It broke if a concurrent connection tried to drop a transactional table which was locked after the savepoint was set. This `DROP TABLE` completed when `ROLLBACK TO SAVEPOINT` was executed because the lock on the table was dropped by the transaction. When the slave later tried to apply the binary log events, it would fail because the table had already been dropped. ([Bug#50124](#))
- **Replication:** When `CURRENT_USER()` or `CURRENT_USER` was used to supply the name and host of the affected user or of the definer in any of the statements `DROP USER`, `RENAME USER`, `GRANT`, `REVOKE`, and `ALTER EVENT`, the reference to `CURRENT_USER()` or `CURRENT_USER` was not expanded when written to the binary log. This resulted in `CURRENT_USER()` or `CURRENT_USER` being expanded to the user and host of the slave SQL thread on the slave, thus breaking replication. Now `CURRENT_USER()` and `CURRENT_USER` are expanded prior to being written to the binary log in such cases, so that the correct user and host are referenced on both the master and the slave. ([Bug#48321](#))
- After an RPM installation `mysqld` would be started with the `root`, rather than the `mysql` user. ([Bug#56574](#))
- The embedded server raised an assertion when it attempted to load plugins. ([Bug#56085](#))
- `FORMAT()` did not respect the decimal point character if the locale was changed and always returned an ASCII value. ([Bug#55912](#))
- CMake produced bad dependencies for the `sql/lex_hash.h` file during configuration. ([Bug#55842](#))
- `mysql_upgrade` did not handle the `--ssl` option properly. ([Bug#55672](#))
- Using `MIN()` or `MAX()` on a column containing the maximum `TIME` value caused a server crash. ([Bug#55648](#))
- Incorrect handling of user variable assignments as subexpressions could lead to incorrect results or server crashes. ([Bug#55615](#))
- The default compiler options used for Mac OS X 10.5 were set incorrectly. ([Bug#55601](#))
- The server was not checking for errors generated during the execution of `Item::val_xxx()` methods when copying data to a group, order, or distinct temp table's row. ([Bug#55580](#))
- `ORDER BY` clauses that included user variable expressions could cause a debug assertion to be raised. ([Bug#55565](#))
- `SHOW CREATE TRIGGER` took a stronger metadata lock than required. This caused the statement to be blocked unnecessarily. For example, `LOCK TABLES ... WRITE` in one session blocked `SHOW CREATE TRIGGER` in another session.

Also, a `SHOW CREATE TRIGGER` statement issued inside a transaction did not release its metadata locks at the end of statement execution. Consequently, `SHOW CREATE TRIGGER` was able to block other sessions from accessing the table (for example, using `ALTER TABLE`). ([Bug#55498](#))

- A single-table `DELETE` ordered by a column that had a hash-type index could raise an assertion or cause a server crash. ([Bug#55472](#))
- A call to `mysql_library_init()` following a call to `mysql_library_end()` caused a client crash. ([Bug#55345](#))
- A statement that was aborted by `KILL QUERY` while it waited on a metadata lock could raise an assertion in debug builds, or send OK to the client instead of `ER_QUERY_INTERRUPTED` in regular builds. ([Bug#55223](#))
- `GROUP BY` operations used `max_sort_length` inconsistently. ([Bug#55188](#))
- The Windows MSI installer would fail to preserve custom settings, such as the configured data directory, during installation. ([Bug#55169](#))
- `InnoDB` produced no warning at startup about illegal `innodb_file_format_check` values. ([Bug#55095](#))
- `IF()` with a subquery argument could raise a debug assertion for debug builds under some circumstances. ([Bug#55077](#))
- Building MySQL on Solaris 8 x86 failed when using Sun Studio due to `gcc` inline assembly code. ([Bug#55061](#))
- When upgrading an existing install with an RPM on Linux, the MySQL server might not have been restarted properly. This was due to a naming conflict when upgrading from a `community` named RPM. Previous installations are now correctly removed,

and the MySQL init script are recreated and then start the MySQL server as normal. ([Bug#55015](#))

- The `thread_concurrency` system variable was unavailable on non-Solaris systems. ([Bug#55001](#))
- `mysqld_safe` contained a syntax error that prevented it from restarting the server. ([Bug#54991](#))
- If audit plugins were installed that were interested in `MYSQL_AUDIT_GENERAL_CLASS` events and the general query log was disabled, failed `INSTALL PLUGIN` or `UNINSTALL PLUGIN` statements caused a server crash. ([Bug#54989](#))
- Some functions did not calculate their `max_length` metadata value correctly. ([Bug#54916](#))
- A `SHOW CREATE TABLE` statement issued inside a transaction did not release its metadata locks at the end of statement execution. Consequently, `SHOW CREATE TABLE` was able to block other sessions from accessing the table (for example, using `ALTER TABLE`). ([Bug#54905](#))
- `INFORMATION_SCHEMA.ENGINES` and `SHOW ENGINES` described `MyISAM` as the default storage engine, but this is not true as of MySQL 5.5.5. ([Bug#54832](#))
- The `MERGE` storage engine tried to use memory mapping on the underlying `MyISAM` tables even on platforms that do not support it and even when `myisam_use mmap` was disabled. This led to a hang for `INSERT INTO ... SELECT FROM` statements that selected from a `MyISAM` table into a `MERGE` table that contained the same `MyISAM` table. ([Bug#54811](#), [Bug#50788](#))
- Incorrect error handling could result in an `OPTIMIZE TABLE` crash. ([Bug#54783](#))
- Performance Schema event collection for a thread could “leak” from one connection to another if the thread was used for one connection, then cached, then reused for another connection. ([Bug#54782](#))
- In debug builds, an assertion could be raised when the server tried to send an OK packet to the client after having failed to detect errors during processing of the `WHERE` condition of an `UPDATE` statement. ([Bug#54734](#))
- In a slave SQL thread or Event Scheduler thread, the `SLEEP()` function could not sleep more than five seconds. ([Bug#54729](#))
- `SET sql_select_limit = 0` did not work. ([Bug#54682](#))
- Assignments of the `PASSWORD()` or `OLD_PASSWORD()` function to a user variable did not preserve the character set of the function return value. ([Bug#54668](#))
- A signal-handler redefinition for `SIGUSR1` was removed. The redefinition could cause the server to encounter a kernel deadlock on Solaris when there are many active threads. Other POSIX platforms might also be affected. ([Bug#54667](#))
- Queries that named view columns in a `GROUP BY` clause could cause a server crash. ([Bug#54515](#))
- Performance Schema displayed spurious startup error messages when the server was run in bootstrap mode. ([Bug#54467](#))
- For distributions built with `cmake` rather than the GNU autotools, `mysql` lacked `pager` support. ([Bug#54466](#))
- The server failed to disregard sort order for some zero-length tuples, leading to an assertion failure. ([Bug#54459](#))
- A join with an aggregated function and impossible `WHERE` condition returned an extra row. ([Bug#54416](#))
- Errors during processing of `WHERE` conditions in `HANDLER ... READ` statements were not detected, so the handler code still tried to send EOF to the client, raising an assertion. ([Bug#54401](#))
- If a session tried to drop a database containing a table opened with `HANDLER` in another session, any `DATABASE` statement (`CREATE`, `DROP`, `ALTER`) executed by that session produced a deadlock. ([Bug#54360](#))
- Deadlocks involving `INSERT DELAYED` statements were not detected. The server could crash if the delayed handler thread was killed due to a conflicting shared metadata lock. ([Bug#54332](#))
- For distributions built with `cmake` rather than the GNU autotools, some scripts were built without the execute bit set. ([Bug#54129](#))
- After `ALTER TABLE` was used on a temporary transactional table locked by `LOCK TABLES`, any later attempts to execute `LOCK TABLES` or `UNLOCK TABLES` caused a server crash. ([Bug#54117](#))
- `INSERT IGNORE INTO ... SELECT` statements could cause a debug assertion to be raised. ([Bug#54106](#))
- `SHOW CREATE EVENT` released all metadata locks held by the current transaction. This invalidated any existing savepoints and raised an assertion if `ROLLBACK TO SAVEPOINT` was executed. ([Bug#54105](#))
- A client could supply data in chunks to a prepared statement parameter other than of type `TEXT` or `BLOB` using the

`mysql_stmt_send_long_data()` C API function (or `COM_STMT_SEND_LONG_DATA` command). This led to a crash because other data types are not valid for long data. ([Bug#54041](#))

- `mysql_secure_installation` did not properly identify local accounts and could incorrectly remove nonlocal `root` accounts. ([Bug#54004](#))
- A client with automatic reconnection enabled saw the error message `Lost connection to MySQL server during query` if the connection was lost between the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions. However, `mysql_stmt_errno()` returned 0, not the corresponding error number 2013. ([Bug#53899](#))
- `INFORMATION_SCHEMA.COLUMNS` reported incorrect precision for `BIGINT UNSIGNED` columns. ([Bug#53814](#))
- The patch for [Bug#36569](#) caused performance regressions and incorrect execution of some `UPDATE` statements. ([Bug#53737](#), [Bug#53742](#))
- Missing Performance Schema tables were not reported in the error log at server startup. ([Bug#53617](#))
- `mysql_upgrade` could incorrectly remove `TRIGGER` privileges. ([Bug#53613](#))
- `SHOW ENGINE PERFORMANCE_SCHEMA STATUS` underreported the amount of memory allocated by Performance Schema. ([Bug#53566](#))
- Portability problems in `SHOW STATUS` could lead to incorrect results on some platforms. ([Bug#53493](#))
- Builds of MySQL generated a large number of warnings. ([Bug#53445](#))
- Performance Schema header files were not installed in the correct directory. ([Bug#53255](#))
- The server could crash when processing subqueries with empty results. ([Bug#53236](#))
- With `lower_case_table_names` set to a nonzero value, searches for table or database names in `INFORMATION_SCHEMA` tables could produce incorrect results. ([Bug#53095](#))
- Use of `uint` in `typelib.h` caused compilation problems in Windows. This was changed to `unsigned int`. ([Bug#52959](#))
- The `mysql-debug.pdb` supplied with releases did not match the corresponding `mysqld.exe`. ([Bug#52850](#))
- The `PERFORMANCE_SCHEMA` database was not correctly created and populated on Windows. ([Bug#52809](#))
- The `large_pages` system variable was tied to the `--large-files` command-line option, not the `--large-pages` option. ([Bug#52716](#))
- Attempts to access a nonexistent table in the `performance_schema` database resulted in a misleading error message. ([Bug#52586](#))
- The ABI check for MySQL failed to compile with `gcc 4.5`. ([Bug#52514](#))
- Performance Schema could enter an infinite loop if required to create a large number of mutex instances. ([Bug#52502](#))
- `mysql_secure_installation` sometimes failed to locate the `mysql` client. ([Bug#52274](#))
- Some queries involving `GROUP BY` and a function that returned `DATE` raised a debug assertion. ([Bug#52159](#))
- If a symbolic link was used in a file path name, the Performance Schema did not resolve all file io events to the same name. ([Bug#52134](#))
- `PARTITION BY KEY` on a `utf32 ENUM` column raised a debugging assertion. ([Bug#52121](#))
- A pending `FLUSH TABLES tbl_list WITH READ LOCK` statement unnecessarily aborted transactions. ([Bug#52117](#))
- `FLUSH TABLES WITH READ LOCK` in one session and `FLUSH TABLES tbl_list WITH READ LOCK` in another session were mutually exclusive.

This bug fix involved several changes to the states displayed by `SHOW PROCESSLIST`:

- `Table lock` was replaced with `Waiting for table level lock`.
- `Waiting for table` was replaced with `Waiting for table flush`.
- New states: `Waiting for global metadata lock`, `Waiting for schema metadata lock`, `Waiting for stored function metadata lock`, `Waiting for stored procedure metadata lock`, `Waiting for table metadata lock`.

(Bug#52044)

- Reading a `ucs2` data file with `LOAD DATA INFILE` was subject to three problems. 1) Incorrect parsing of the file as `ucs2` data, resulting in incorrect length of the parsed string. This is fixed by truncating the invalid trailing bytes (incomplete multibyte characters) when reading from the file. 2) Reads from a proper `ucs2` file did not recognize newline characters. This is fixed by first checking whether a byte is a newline (or any other special character) before reading it as a part of a multibyte character. 3) When using user variables to hold column data, the character set of the user variable was set incorrectly to the database charset. This is fixed by setting it to the character set specified in the `LOAD DATA INFILE` statement, if any. (Bug#51876)
- `XA START` had a race condition that could cause a server crash. (Bug#51855)
- The results of some `ORDER BY ... DESC` queries were sorted incorrectly. (Bug#51431)
- `Index Merge` between three indexes could return incorrect results. (Bug#50389)
- `MIN()` and `MAX()` returned incorrect results for `DATE` columns if the set of values included '`0000-00-00`'. (Bug#49771)
- Searches in `INFORMATION_SCHEMA` tables for rows matching a nonexistent database produced an error instead of an empty query result. (Bug#49542)
- `DROP DATABASE` failed if there was a `TEMPORARY` table with the same name as a non-`TEMPORARY` table in the database. (Bug#48067)
- An assertion occurred in `ha_myisammrg.cc` line 1137:

```
DBUG_ASSERT(this->file->children_attached);
```

The problem was found while running RQG tests and the assertion occurred during `REPAIR`, `OPTIMIZE`, and `ANALYZE` operations. (Bug#47633)

- The optimize method of the ARCHIVE storage engine did not preserve the FRM embedded in the ARZ file when rewriting the ARZ file for optimization. This meant an ARCHIVE table that had been optimized could not be discovered.

The ARCHIVE engine stores the FRM in the ARZ file so it can be transferred from machine to machine without also needing to copy the FRM file. The engine subsequently restores the embedded FRM during discovery. (Bug#45377)

- With `character_set_connection` set to `utf16` or `utf32`, `CREATE TABLE t1 AS SELECT HEX() ...` caused a server crash. (Bug#45263)
- The `my_like_range_xxx()` functions returned badly formed maximum strings for Asian character sets, which caused problems for storage engines. (Bug#45012)
- A debugging assertion could be raised after a write failure to a closed socket. (Bug#42496)
- Enumeration plugin variables were subject to a type casting error, causing inconsistent results between different platforms. (Bug#42144)
- Sort-`index_merge` for join tables other than the first table used excessive memory. (Bug#41660)
- `DROP TABLE` held a lock during `unlink()` file system operations, causing performance problems if `unlink()` took a long time. (Bug#41158)
- Rows inserted in a table by one session were not immediately visible to another session that queried the table, even if the insert had committed. (Bug#37521)
- Statements of the form `UPDATE ... WHERE ... ORDER BY` used a `filesort` even when not required. (Bug#36569)

See also Bug#53737, Bug#53742.

- Reading from a temporary MERGE table, with two non-temporary child MyISAM tables, resulted in the error:

```
ERROR 1168 (HY000): Unable to open underlying table which is differently
defined or of non-MyISAM type or doesn't exist
```

(Bug#36171)

- `safemalloc` was excessively slow under certain conditions and has been removed. The `--skip-safemalloc` server op-

tion has also been removed, and the `--with-debug=full` configuration option is no different from `--with-debug`. ([Bug#34043](#))

- Threads that were calculating the estimated number of records for a range scan did not respond to the `KILL` statement. That is, if a `range` join type is possible (even if not selected by the optimizer as a join type of choice and thus not shown by `EXPLAIN`), the query in the `statistics` state (shown by the `SHOW PROCESSLIST`) did not respond to the `KILL` statement. ([Bug#25421](#))
- Problems in the atomic operations implementation could lead to server crashes. ([Bug#22320](#), [Bug#52261](#))

D.1.6. Changes in MySQL 5.5.5 (06 July 2010)

icc Notes:

- This is the final release of MySQL 5.5 for which Generic Linux MySQL binary packages built with the `icc` compiler on x86 and x86_64 will be offered. These were previously produced as an alternative to our main packages built using `gcc`, as they provided noticeable performance benefits. In recent times the performance differences have diminished and build and runtime problems have surfaced, thus it is no longer viable to continue producing them.

We continue to use the `icc` compiler to produce our distribution-specific RPM packages on ia64.

InnoDB Notes:

- `InnoDB` has been upgraded to version 1.1.1. This version is considered of “early adopter” quality.

`InnoDB` is now the default storage engine, rather than `MyISAM`, in the regular and enterprise versions of MySQL. This change has the following consequences:

- Existing tables are not affected by this change, only new tables that are created.
- Some of the `InnoDB` option settings also change, so that the default configuration represents the best practices for `InnoDB` functionality, reliability, and file management: `innodb_file_format=Barracuda` rather than `Antelope`, `innodb_strict_mode=ON` rather than `OFF`, and `innodb_file_per_table=ON` rather than `OFF`.
- The system tables remain in `MyISAM` format.
- `MyISAM` remains the default storage engine for the embedded version of MySQL.

Follow these steps to ensure a smooth transition:

- Familiarize yourself with the new default setting for the `InnoDB` file-per-table option, which creates a separate `.ibd` file for each user table. Adapt any backup procedure to include these files. For details, see [Section 13.6.3, “Using Per-Table Tablespaces”](#).
- Test the installation and operation for any applications that you run on the database server, to determine if they use any features specific to `MyISAM` that cause problems during installation (when the tables are created) or at runtime (when `MyISAM`-specific features might fail, or reliance on `MyISAM` settings for performance might become apparent). The `InnoDB` “strict” mode might also alert you to problems while setting up tables for an application.
- As a preliminary test for individual tables rather than an entire application, you can use the statement `ALTER TABLE table_name ENGINE=INNODB;` to convert an existing table to use the `InnoDB` storage engine, and then run compatibility and performance tests.
- Where necessary, add `ENGINE=MYISAM` clauses to `CREATE TABLE` statements, for tables that use features specific to `MyISAM`, such as full-text search.
- Benchmark the most important queries, to check whether you need to make changes to the table indexes.
- Measure the performance of applications under typical load, to check whether you need to change any additional `InnoDB` configuration settings.
- As a last resort, if a database server is devoted entirely to applications that can only run with `MyISAM` tables, you could add a `default-storage-engine` line in the configuration file, or a `--default-storage-engine` option in the database server startup command, to re-enable `MyISAM` as the default storage engine for that server. For details about setting the default storage engine, see [Section 13.3, “Setting the Storage Engine”](#).

Functionality added or changed:

- **Incompatible Change:** All numeric operators and functions on integer, floating-point and `DECIMAL` values now throw an “out of range” error ([ER_DATA_OUT_OF_RANGE](#)) rather than returning an incorrect value or `NULL`, when the result is out of the supported range for the corresponding data type. See [Section 10.6, “Out-of-Range and Overflow Handling”](#). ([Bug#8433](#))
- **InnoDB Storage Engine:** The `INFORMATION_SCHEMA.INNODB_TRX` table now includes a number of new fields that duplicate information from the `SHOW ENGINE INNODB STATUS` output. You no longer need to parse that output to get complete transaction information. ([Bug#53336](#))
- **InnoDB Storage Engine:** `InnoDB` stores redo log records in a hash table during recovery. On 64-bit systems, this hash table was 1/8 of the buffer pool size. To reduce memory usage, the dimension of the hash table was reduced to 1/64 of the buffer pool size (or 1/128 on 32-bit systems). ([Bug#53122](#))
- Previously, the `innodb_file_format_check` system variable served a dual purpose. Setting it at server startup would keep `InnoDB` from starting if any tables used a more recent file format than supported by the current level of `InnoDB`. If `InnoDB` could start, the same system variable was set to the “highest” file format value used by any `InnoDB` table in the database. Thus, its value could change from the value you specified.

Now, checking and recording the file format tag are handled using separate variables. `innodb_file_format_check` can be set to 1 or 0 at server startup to enable or disable whether `InnoDB` checks the file format tag in the system tablespace. If the tag is checked and is higher than that supported by the current version of `InnoDB`, an error occurs and `InnoDB` does not start. If the tag is not higher, `InnoDB` sets the value of `innodb_file_format_max` to the file format tag.

For background information about `InnoDB` file-format management, see [Section 13.7.4, “InnoDB File Format Management”](#). ([Bug#49792](#), [Bug#53654](#))

- The `Rows_examined` value in slow query log rows now is nonzero for `UPDATE` and `DELETE` statements that modify rows. ([Bug#49756](#))
- The deprecated `mysql_fix_privilege_tables` script has been removed. ([Bug#42589](#))
- There is a new system variable, `skip_name_resolve`, that is set from the value of the `--skip-name-resolve` server option. This provides a way to determine at runtime whether the server uses name resolution for client connections. ([Bug#37168](#))
- Added the `SHA2()` function, which calculates the SHA-2 family of hash functions (SHA-224, SHA-256, SHA-384, and SHA-512). (Contributed by Bill Karwin) ([Bug#13174](#))
- It is now possible to build MySQL on all platforms using `CMake` instead of the GNU autotools. (Prior to MySQL 5.5.5, `CMake` support was limited to Windows.) For instructions on using `CMake` to build MySQL, see <http://forge.mysql.com/wiki/CMake>.

Bugs fixed:

- **Performance: InnoDB Storage Engine:** Deadlock detection could be a bottleneck in `InnoDB` processing, if many transactions attempted to update the same row simultaneously. The algorithm has been improved to enhance performance and scalability, in the InnoDB Plugin for MySQL 5.1, and in InnoDB 1.1 for MySQL 5.5. ([Bug#49047](#))
- **Performance:** While looking for the shortest index for a covering index scan, the optimizer did not consider the full row length for a clustered primary key, as in `InnoDB`. Secondary covering indexes will now be preferred, making full table scans less likely. ([Bug#39653](#))

See also [Bug#55656](#).

- **Security Fix:** The server could crash if there were alternate reads from two indexes on a table using the `HANDLER` interface. ([Bug#54007](#), [CVE-2010-3681](#))
- **Security Fix:** The server failed to check the table name argument of a `COM_FIELD_LIST` command packet for validity and compliance to acceptable table name standards. This could be exploited to bypass almost all forms of checks for privileges and table-level grants by providing a specially crafted table name argument to `COM_FIELD_LIST`.

In MySQL 5.0 and above, this permitted an authenticated user with `SELECT` privileges on one table to obtain the field definitions of any table in all other databases and potentially of other MySQL instances accessible from the server's file system.

Additionally, for MySQL version 5.1 and above, an authenticated user with `DELETE` or `SELECT` privileges on one table could delete or read content from any other table in all databases on this server, and potentially of other MySQL instances accessible from the server's file system. ([Bug#53371](#), [CVE-2010-1848](#))

- **Security Fix:** The server was susceptible to a buffer-overflow attack due to a failure to perform bounds checking on the table name argument of a `COM_FIELD_LIST` command packet. By sending long data for the table name, a buffer is overflowed, which could be exploited by an authenticated user to inject malicious code. ([Bug#53237](#), [CVE-2010-1850](#))
- **Security Fix:** `LOAD DATA INFILE` did not check for SQL errors and sent an OK packet even when errors were already reported. Also, an assert related to client/server protocol checking in debug servers sometimes was raised when it should not have been. ([Bug#52512](#), [CVE-2010-3683](#))
- **Security Fix:** Privilege checking for `UNINSTALL PLUGIN` was incorrect. ([Bug#51770](#), [CVE-2010-1621](#))
- **Security Fix:** The server could be tricked into reading packets indefinitely if it received a packet larger than the maximum size of one packet. ([Bug#50974](#), [CVE-2010-1849](#))
- **Incompatible Change:** `TRUNCATE TABLE` did not take an exclusive lock on a table if truncation was done by deleting all rows in the table. For `InnoDB` tables, this could break proper isolation because `InnoDB` ended up aborting some granted locks when truncating a table. Now an exclusive metadata lock is taken before `TRUNCATE TABLE` can proceed. This guarantees that no other transaction is using the table.

Incompatible change: Truncation using delete no longer fails if `sql_safe_updates` is enabled (this was an undocumented side effect). ([Bug#42643](#))

- **Incompatible Change:** After `SET TRANSACTION ISOLATION LEVEL` to set the isolation level for the next transaction, the session value of the `tx_isolation` system variable could appear to change after completion of statements within the transaction to the transaction isolation level. Now the current transaction isolation level is now established at transaction start. If there was a `SET TRANSACTION ISOLATION LEVEL statement`, the value is taken from it. Otherwise, the session `tx_isolation` value is used. A change in the session value while a transaction is active is still allowed, but no longer affects the current transaction isolation level. This is an incompatible change. A change in the session isolation level made while there is no active transaction overrides a `SET TRANSACTION ISOLATION LEVEL statement`, if there was any. ([Bug#20837](#))
- **Important Change: Replication:** It was possible to set `sql_log_bin` with session scope inside a transaction or subquery. ([Bug#53437](#))
- **Important Change: Replication:** When changing `binlog_format` or `bin-log_direct_non_transactional_updates`, permissions were not checked prior to checking the scope and context of the variable being changed.

As a result of this fix, an error is no longer reported when—in the context of a transaction or a stored function—you try to set a value for a session variable that is the same as its previous value, or for a variable whose scope is global only. ([Bug#51277](#))

- **Important Change: Replication:** When invoked, `CHANGE MASTER TO` and `SET GLOBAL sql_slave_skip_counter` now cause information to be written to the error log about the slave's state prior to execution of the statement. For `CHANGE MASTER TO`, this information includes the previous values of `MASTER_HOST`, `MASTER_PORT`, `MASTER_LOG_FILE`, and `MASTER_LOG_POS`. For `SET GLOBAL sql_slave_skip_counter`, this information includes the previous values of `RELAY_LOG_FILE`, `RELAY_LOG_POS`, and `sql_slave_skip_counter`. ([Bug#43406](#), [Bug#43407](#))
- **Important Change:** When using fast `ALTER TABLE`, different internal ordering of indexes in the MySQL optimizer and the `InnoDB` storage engine could cause error messages about possibly mixed up `.frm` files and incorrect index use. ([Bug#47622](#))
- **InnoDB Storage Engine: Replication:** `TRUNCATE TABLE` performed on a temporary table using the `InnoDB` storage engine was logged even when using row-based mode. ([Bug#51251](#))
- **InnoDB Storage Engine: Replication:** Reading from a table that used a self-logging storage engine and updating a table that used a transactional engine (such as `InnoDB`) generated changes that were written to the binary log using statement format which could make slaves diverge. However, when using mixed logging format, such changes should be written to the binary log using row format. (This issue did not occur when reading from tables using a self-logging engine and updating `MyISAM` tables, as this was already handled by checking for combinations of non-transactional and transactional engines.) Now such statements are classified as unsafe, and in mixed mode, cause a switch to row-based logging. ([Bug#49019](#))
- **InnoDB Storage Engine:** The server could crash during shutdown, if started with the option `-innodb_use_sys_malloc=0`. ([Bug#54453](#))
- **InnoDB Storage Engine:** The server could crash with a message `InnoDB: Assertion failure in thread nnnn`, typically during shutdown on a Windows system. ([Bug#53947](#))
- **InnoDB Storage Engine:** Some combinations of `SELECT` and `SELECT FOR UPDATE` statements could fail with errors about locks, or incorrectly release a row lock during a `semi-consistent read` operation. ([Bug#53674](#))
- **InnoDB Storage Engine:** Adding a unique key on multiple columns, where one of the columns is null, could mistakenly report duplicate key errors. ([Bug#53290](#))

- **InnoDB Storage Engine:** Fixed a checksum error reported for compressed tables when the `--innodb_checksums` option is enabled. Although the message stated that the table was corrupted, the table is actually fine after the fix. ([Bug#53248](#))
- **InnoDB Storage Engine:** When reporting a foreign key constraint violation during `INSERT`, InnoDB could display uninitialized data for the `DB_TRX_ID` and `DB_ROLL_PTR` system columns. ([Bug#53202](#))
- **InnoDB Storage Engine:** The values of `innodb_buffer_pool_pages_total` and `innodb_buffer_pool_pages_misc` in the `information_schema.global_status` table could be computed incorrectly. ([Bug#52983](#))
- **InnoDB Storage Engine:** `InnoDB` page splitting could enter an infinite loop for compressed tables. ([Bug#52964](#))
- **InnoDB Storage Engine:** An overly strict assertion could fail during the purge of delete-marked records in `DYNAMIC` or `COMPRESSED` InnoDB tables that contain column prefix indexes. ([Bug#52746](#))
- **InnoDB Storage Engine:** `InnoDB` attempted to choose off-page storage without ensuring that there was an “off-page storage” flag in the record header. To correct this, in `DYNAMIC` and `COMPRESSED` formats, `InnoDB` stores locally any non-`BLOB` columns having a maximum length not exceeding 256 bytes. This is because there is no room for the “external storage” flag when the maximum length is 255 bytes or less. This restriction trivially holds in `REDUNDANT` and `COMPACT` formats, because there `InnoDB` always stores locally columns having a length up to `local_len = 788` bytes. ([Bug#52745](#))
- **InnoDB Storage Engine:** Connections waiting for an `InnoDB` row lock ignored `KILL` until the row lock wait ended. Now, `KILL` during lock wait results in “query interrupted” instead of “lock wait timeout exceeded”. The corresponding transaction is rolled back. ([Bug#51920](#))
- **InnoDB Storage Engine:** `InnoDB` checks to see whether a row could possibly exceed the maximum size if all columns are fully used. This produced `Row size too large` errors for some tables that could be created with the built-in `InnoDB` from older MySQL versions. Now the check is only done when `innodb_strict_mode` is enabled or if the table is dynamic or compressed. ([Bug#50495](#))
- **InnoDB Storage Engine:** Multi-statement execution could fail with an error about foreign key constraints. This problem could affect calls to `mysql_query()` and `mysql_real_query()`, and `CALL` statements that invoke stored procedures. ([Bug#48024](#))
- **InnoDB Storage Engine:** A mismatch between index information maintained within the `.frm` files and the corresponding information in the InnoDB system tablespace could produce this error: `[ERROR] Index index of table has n columns unique inside InnoDB, but MySQL is asking statistics for m columns. Have you mixed up .frm files from different installations?` ([Bug#44571](#))
- **Partitioning: Replication:** Attempting to execute `LOAD DATA` on a partitioned `MyISAM` table while using statement-based logging mode caused the master to hang or crash. ([Bug#51851](#))
- **Partitioning: Replication:** The `NO_DIR_IN_CREATE` server SQL mode was not enforced when defining subpartitions. In certain cases, this could lead to failures on replication slaves. ([Bug#42954](#))
- **Partitioning:** Rows inserted into a table created using a `PARTITION BY LIST COLUMNS` option referencing multiple columns could be inserted into the wrong partition. ([Bug#52815](#))
- **Partitioning:** Partition pruning on `RANGE` partitioned tables did not always work correctly; the last partition was not excluded if the range was beyond it (when not using `MAXVALUE`). Now the last partition is not included if the partitioning function value is not within the range. ([Bug#51830](#))
- **Partitioning:** Attempting to partition a table using a `DECIMAL` column caused the server to crash; this is not supported and is now specifically not permitted. ([Bug#51347](#))
- **Partitioning:** `ALTER TABLE` statements that cause table partitions to be renamed or dropped (such as `ALTER TABLE ... ADD PARTITION`, `ALTER TABLE ... DROP PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION`) — when run concurrently with queries against the `INFORMATION_SCHEMA.PARTITIONS` table — could fail, cause the affected partitioned tables to become unusable, or both. This was due to the fact that the `INFORMATION_SCHEMA` database ignored the name lock imposed by the `ALTER TABLE` statement on the partitions affected. In particular, this led to problems with `InnoDB` tables, because `InnoDB` would accept the rename operation, but put it in a background queue, so that subsequent rename operations failed when `InnoDB` was unable to find the correct partition. Now, `INFORMATION_SCHEMA` honors name locks imposed by ongoing `ALTER TABLE` statements that cause partitions to be renamed or dropped. ([Bug#50561](#))

See also [Bug#47343](#), [Bug#45808](#).

- **Partitioning:** The `insert_id` server system variable was not reset following an insert that failed on a partitioned `MyISAM` table having an `AUTO_INCREMENT` column. ([Bug#50392](#))
- **Partitioning:** Foreign keys are not supported on partitioned tables. However, it was possible using an `ALTER TABLE` statement to set a foreign key on a partitioned table; it was also possible to partition a table with a single foreign key. ([Bug#50104](#))

- **Partitioning:** It was possible to execute a `CREATE TEMPORARY TABLE tmp LIKE pt` statement, where `pt` is a partitioned table, even though partitioned temporary tables are not permitted, which caused the server to crash. Now a check is performed to prevent such statements from being executed. ([Bug#49477](#))
- **Partitioning:** When attempting to perform DDL on a partitioned table and the table's `.par` file could not be found, the server returned the inaccurate error message `OUT OF MEMORY; RESTART SERVER AND TRY AGAIN (NEEDED 2 BYTES)`. Now in such cases, the server returns the error `FAILED TO INITIALIZE PARTITIONS FROM .PAR FILE.` ([Bug#49161](#))
- **Partitioning:** `GROUP BY` queries performed poorly for some partitioned tables. This was due to the block size not being set for partitioned tables, thus the keys per block was not correct, which could cause such queries to be optimized incorrectly. ([Bug#48229](#))

See also [Bug#37252](#).

- **Partitioning:** `REPAIR TABLE` failed for partitioned `ARCHIVE` tables. ([Bug#46565](#))
- **Replication:** When using unique keys on `NULL` columns in row-based replication, the slave sometimes chose the wrong row when performing an update. This happened because a table having a unique key on such a column could have multiple rows containing `NULL` for the column used by the unique key, and the slave merely picked the first row containing `NULL` in that column. ([Bug#53893](#))
- **Replication:** When a `CREATE TEMPORARY TABLE ... SELECT` statement was executed within a transaction that updated only transactional engines and was later rolled back (for example, due to a deadlock) the changes—including the creation of the temporary table—were not written to the binary log, which caused subsequent updates to this table to fail on the slave. ([Bug#53421](#))
- **Replication:** When using the statement-based logging format, statements that used `CONNECTION_ID()` were always kept in the transaction cache; consequently, nontransactional changes that should have been flushed before the transaction were kept in the transaction cache. ([Bug#53075](#))

This regression was introduced by [Bug#51894](#).

- **Replication:** In some cases, attempting to update a column with a value of an incompatible type resulted in a mismatch between master and slave because the column value was set to its implicit default value on the master (as expected), but the same column on the slave was set to `NULL`. ([Bug#52868](#))
- **Replication:** ACK packets in semisynchronous replication were not checked for length and malformed packets could cause a server crash. ([Bug#52748](#))
- **Replication:** When temporary tables were in use, switching the binary logging format from `STATEMENT` to `ROW` did not take effect until all temporary tables were dropped. (The existence of temporary tables should prevent switching the format only from `ROW` to `STATEMENT` from taking effect, not the reverse.) ([Bug#52616](#))
- **Replication:** A buffer overrun in the handling of `DATE` column values could cause `mysqlbinlog` to fail when reading back logs containing certain combinations of DML on a table having a `DATE` column followed by dropping the table. ([Bug#52202](#))
- **Replication:** The failure of a `REVOKE` statement was logged with the wrong error code, causing replication slaves to stop even when the failure was expected on the master. ([Bug#51987](#))
- **Replication:** Issuing any DML on a temporary table `temp` followed by `DROP TEMPORARY TABLE temp`, both within the same transaction, caused replication to fail.

The fix introduces a change to statement-based binary logging with respect to temporary tables. Within a transaction, changes to temporary tables are saved to the transaction cache and written to the binary log when the transaction commits. Otherwise, out-of-order logging of events could occur. This means that temporary tables are treated similar to transactional tables for purposes of caching and logging. This affects assessment of statements as safe or unsafe and the associated error message was changed from:

```
Unsafe statement written to the binary log using statement format
since BINLOG_FORMAT = STATEMENT. Statements that read from both
transactional and non-transactional tables and write to any of them
are unsafe.
```

To:

```
Unsafe statement written to the binary log using statement format
since BINLOG_FORMAT = STATEMENT. Statements that read from both
transactional (or a temporary table of any engine type) and
non-transactional tables and write to any of them are unsafe.
```

([Bug#51894](#))

See also [Bug#51291](#), [Bug#53075](#), [Bug#53259](#), [Bug#53452](#), [Bug#54872](#).

This regression was introduced by [Bug#46364](#).

- **Replication:** The flag stating whether a user value was signed or unsigned (`unsigned_flag`) could sometimes change between the time that the user value was recorded for logging purposes and the time that the value was actually written to the binary log, which could lead to inconsistency. Now `unsigned_flag` is copied when the user variable value is copied, and the copy of `unsigned_flag` is then used for logging. ([Bug#51426](#))

See also [Bug#49562](#).

- **Replication:** Enabling `binlog_direct_non_transactional_updates` causes nontransactional changes to be written to the binary log upon committing the statement. However, even when not enabled, the addition of this variable introduced a number of undesired changes in behavior:
 1. When using `ROW` or `MIXED` logging mode: Nontransactional changes executed within a transaction prior to any transactional changes were written to the statement cache, but those following any transactional changes were written to the transactional cache instead, causing these (later) nontransactional changes to be lost.
 2. When using `ROW` or `MIXED` logging mode: When rolling back a transaction, any nontransactional changes that might be in the transaction cache were disregarded and truncated along with the transactional changes.
 3. When using `STATEMENT` logging mode: A statement that combined transactional and nontransactional changes prior to any other transactional changes within the transaction, but failed, was kept in the transactional cache until the transaction ended, rather than being written to the binary log at the instant of failure (and not deferred to the end of the transaction).

These problems have been handled as follows:

- The setting for `binlog_direct_non_transactional_updates` no longer has any effect when the value of `binlog_format` is either `ROW` or `MIXED`. This addresses the first two issues previously listed.
- When using statement-based logging with `binlog_direct_non_transactional_updates` set to `ON`, any statement combining transactional and nontransactional changes within the same transaction is now stored in the transaction cache, whether it succeeds or not, and regardless of its order of execution among any transactional statements within that transaction. This means that such a statement is now written to the binary log only on transaction commit or rollback.

([Bug#51291](#))

This regression was introduced by [Bug#46364](#).

- **Replication:** When using temporary tables the binary log needs to insert a pseudo-thread ID for threads that are using temporary tables, each time a switch happens between two threads, both of which are using temporary tables. However, if a thread issued a failing statement before exit, its ID was not recorded in the binary log, and this in turn caused the ID for the next thread that tried to do something with a temporary table not to be logged as well. Subsequent replays of the binary log failed with the error `TABLE ... DOESN'T EXIST`. ([Bug#51226](#))
- **Replication:** If the master was using `sql_mode='TRADITIONAL'`, duplicate key errors were not sent to the slave, which received `0` rather than the expected error code. This caused replication to fail even when such an error was expected. ([Bug#51055](#))
- **Replication:** DDL statements that lock tables (such as `ALTER TABLE`, `CREATE INDEX`, and `CREATE TRIGGER`) caused spurious `ER_BINLOG_ROW_MODE_AND_STMT_ENGINE` or `ER_BINLOG_STMT_MODE_AND_ROW_ENGINE` errors, even though they did not insert rows into any tables.

Note

The error `ER_BINLOG_ROW_MODE_AND_STMT_ENGINE` is generated when `binlog_format=ROW` and a statement modifies a table restricted to statement-based logging; `ER_BINLOG_STMT_MODE_AND_ROW_ENGINE` is generated when `binlog_format=STATEMENT` and a statement modifies a table restricted to row-based logging.

([Bug#50479](#))

This regression was introduced by [Bug#39934](#).

- **Replication:** When run with the `--database` option, `mysqlbinlog` printed `ROLLBACK` statements but did not print any corresponding `SAVEPOINT` statements. ([Bug#50407](#))
- **Replication:** When a `CREATE EVENT` statement was followed by an additional statement and the statements were executed together as a single statement, the `CREATE EVENT` statement was padded with “garbage” characters when written to the binary log, which led to a syntax error when trying to read back from the log. ([Bug#50095](#))

- **Replication:** When using a non-transactional table on the master with autocommit disabled, no `COMMIT` was recorded in the binary log following a statement affecting this table. If the slave's copy of the table used a transactional storage engine, the result on the slave was as though a transaction had been started, but never completed. ([Bug#49522](#))

See also [Bug#29288](#).

- The `make_binary_distribution` target to `make` could fail on some platforms because the lines generated were too long for the shell. ([Bug#54590](#))
- Inconsistent checking of the relationship between `SHOW` statements and `INFORMATION_SCHEMA` queries caused such queries to fail sometimes. ([Bug#54422](#))
- A crash occurred if a table that was locked with `LOCK TABLES` was listed twice in a `DROP TABLE` statement. ([Bug#54282](#))
- `ALTER TABLE` for views is not legal but did not produce an error. (If you need to rename a view, use `RENAME TABLE`.) ([Bug#53976](#))
- Valgrind warnings resulting from passing incomplete `DATETIME` values to the `TIMESTAMP()` function were corrected. ([Bug#53942](#))
- Builds of the embedded `mysqld` would fail due to a missing element of the `struct NET`. ([Bug#53908](#), [Bug#53912](#))
- The definition of the `MY_INIT` macro in `my_sys.h` included an extraneous semicolon, which could cause compilation failure. ([Bug#53906](#))
- Queries that used `MIN()` or `MAX()` on indexed columns could be optimized incorrectly. ([Bug#53859](#))
- `UPDATE` on an `InnoDB` table modifying the same index that was used to satisfy the `WHERE` condition could trigger a debug assertion under some circumstances. ([Bug#53830](#))
- MySQL incorrectly processed `ALTER DATABASE `#mysql50#<special>` UPGRADE DATA DIRECTORY NAME` where `<special>` was `., . . .`, or a sequence starting with `./` or `../`. It used the server data directory (that contains other regular databases) as the database directory. ([Bug#53804](#), [CVE-2010-2008](#))
- `OPTIMIZE TABLE` could be run on a table in use by a transaction in a different session, causing repeatable read to break. ([Bug#53798](#))
- `InnoDB` crashed when replacing duplicates in a table after a fast `ALTER TABLE` added a unique index. ([Bug#53592](#))
- For `InnoDB` tables, the error handler for a fast `CREATE INDEX` did not reset the error state of the transaction before attempting to undo a failed operation, resulting in a crash. ([Bug#53591](#))
- For single-table `DELETE` statements that used quick select and index scan simultaneously caused a server crash or assertion failure. ([Bug#53450](#))
- Certain path names passed to `LOAD_FILE()` could cause a server crash. ([Bug#53417](#))
- If the `completion_type` session variable was changed after a stored procedure or prepared statement had been cached, the change had no effect on subsequent executions of the procedure or statement. ([Bug#53346](#))
- The `AND CHAIN` option for `COMMIT` and `ROLLBACK` failed to preserve the current transaction isolation level. Setting `completion_type` to 1 also failed to do so. ([Bug#53343](#))
- Incorrect results could be returned for `LEFT JOIN` of `InnoDB` tables with an impossible `WHERE` condition. ([Bug#53334](#))
- The `Lock_time` value in the slow query log was negative for stored routines. ([Bug#53191](#))
- Setting the `innodb_change_buffering` system variable to `DEFAULT` produced an incorrect result. ([Bug#53165](#))
- `mysqldump` and `SELECT ... INTO OUTFILE` truncated long `BLOB` and `TEXT` values to 766 bytes. ([Bug#53088](#))
- On some systems, such as Mac OS X, the `sockaddr_in` and `sockaddr_in6` structures contain a non-standard field (`sin_len / sin6_len`) that must be set but was not. This resulted in hostname lookup failure. ([Bug#52923](#))
- In the debug version of the server, the `FreeState()` function could in some circumstances be called twice, leading to an assertion failure. ([Bug#52884](#))
- Concurrent `SHOW COLUMNS` statements could cause a server crash. ([Bug#52856](#))
- With a non-`latin1` ASCII-based current character set, the server inappropriately converted `DATETIME` values to strings. This resulted in the optimizer not using indexes on such columns. ([Bug#52849](#))

- `mysqld_safe` set `plugin_dir` using a default path name rather than a path depending on `basedir`. ([Bug#52737](#))
- Semi-consistent read was implemented for `InnoDB` to address [Bug#3300](#). Semi-consistent reads do not block when a non-matching record is already locked by some other transaction. If the record is not locked, a lock is acquired, but is released if the record does not match the `WHERE` condition. However, semi-consistent read was attempted even for `UPDATE` statements having a `WHERE` condition of the form `pk_col1=constant1, ..., pk_colN=constantN`. Some code that was designed with the assumption that semi-consistent read would be only attempted on table scans, failed. ([Bug#52663](#))
- Setting `@@GLOBAL.debug` to an empty string failed to clear the current debug settings. ([Bug#52629](#))
- `SHOW CREATE TABLE` was blocked if the table was write locked by another session. ([Bug#52593](#))
- The `length` and `max_length` metadata values were incorrect for columns with the `TEXT` family of data types that used multibyte character sets. This bug was introduced in MySQL 5.5.3. ([Bug#52520](#))
- `mysql_upgrade` attempted to work with stored routines before they were available. ([Bug#52444](#))
- The `check_table_is_closed()` debugging function did not protect access to the `MyISAM` open tables list, with the result that server crashes could occur during table drop or rename operations. ([Bug#52432](#))
- Spurious duplicate-key errors occurred for multiple-column indexes on columns with the `BINARY` data type. ([Bug#52430](#))
- `EXPLAIN EXTENDED` crashed trying to resolve references to freed temporary table columns for `GROUP_CONCAT() ORDER BY` arguments. ([Bug#52397](#))
- During installing of MySQL server using the MSI package on Windows, the `default-character-set` option would be included in the default configuration template file. This would cause the MySQL server to fail to start properly. ([Bug#52380](#))
- Two sessions trying to set the global `event_scheduler` system variable to `OFF` resulted in one of them hanging waiting for the event scheduler to stop. ([Bug#52367](#))
- There was a race condition between flags used for signaling that a query was killed, which led to error-reporting and lock-acquisition problems. ([Bug#52356](#))
- For a concurrent load of 16 or more connections containing many `LOCK TABLES WRITE` statements for the same table, server throughput was significantly lower for MySQL 5.5.3 and 5.5.4 than for earlier versions (10%–40% lower depending on concurrency). ([Bug#52289](#))
- Operations on geometry data types failed on some systems for builds compiled with Sun Studio. ([Bug#52208](#))
- The optimizer could attempt to evaluate the `WHERE` clause before any rows had been read, resulting in a server crash. ([Bug#52177](#))
- Cast operations on `NULL DECIMAL` values could cause server crashes or Valgrind warnings. ([Bug#52168](#))
- An assertion was raised as a result of a `NULL` string being passed to the `dtoa` code. ([Bug#52165](#))
- A memory leak occurred due to missing deallocation of the `comparators` array (a member of the `Arg_comparator` class). ([Bug#52124](#))
- For debug builds, creating a view containing a subquery that might require collation adjustment caused an assertion to be raised. For example, this could occur if some items had different collations but the result collation could be adjusted to the one of them. ([Bug#52120](#))
- Aggregate functions could incorrectly return `NULL` in outer join queries. ([Bug#52051](#))
- For outer joins, the optimizer could fail to properly calculate table dependencies. ([Bug#52005](#))
- A `COUNT(DISTINCT)` query on a view could cause a server crash. ([Bug#51980](#))
- For LDML-defined collations, some data structures were not initialized properly to enable `UPPER()` and `LOWER()` to work correctly. ([Bug#51976](#))
- On Windows, `LOAD_FILE()` could cause a crash for some pathnames. ([Bug#51893](#))
- Invalid memory reads occurred for `HANDLER ... READ NEXT` after a failed `HANDLER ... READ FIRST`. ([Bug#51877](#))
- After `TRUNCATE TABLE` of a `MyISAM` table, subsequent queries could crash the server if `myisam_use mmap` was enabled. ([Bug#51868](#))

- If `myisam_sort_buffer_size` was set to a small value, table repair for `MyISAM` tables with `FULLTEXT` indexes could crash the server. ([Bug#51866](#))
- Stored routine DDL statements were written to the binary log using statement-based format regardless of the current logging format. ([Bug#51839](#))
- A problem with equality propagation optimization for prepared statements and stored procedures caused a server crash upon re-execution of the prepared statement or stored procedure. ([Bug#51650](#))

See also [Bug#8115](#), [Bug#8849](#).

- The optimizer performed an incorrect join type when `COALESCE()` appeared within an `IN()` operation. ([Bug#51598](#))
- Locking involving the `LOCK_plugin`, `LOCK_global_system_variables`, and `LOCK_status` mutexes could deadlock. ([Bug#51591](#))
- Executing a `LOAD XML INFILE` statement could sometimes lead to a crash of the MySQL Server. ([Bug#51571](#))
- The server crashed when the optimizer attempted to determine constant tables but a table storage engine did not support exact record count. ([Bug#51494](#))
- The server could crash populating the `INFORMATION_SCHEMA.PROCESSLIST` table due to lack of mutex protection. ([Bug#51377](#))
- Use of `HANDLER` statements with tables that had spatial indexes caused a server crash. ([Bug#51357](#))
- With an XA transaction active, `SET autocommit = 1` could cause side effects such as memory corruption or a server crash. ([Bug#51342](#))
- Corrupt `MyISAM` tables were automatically repaired even when `myisam_recover_options` was set to `OFF`. ([Bug#51327](#))
- Following a bulk insert into a `MyISAM` table, if `MyISAM` failed to build indexes using repair by sort, data file corruption could occur. ([Bug#51307](#))
- `CHECKSUM TABLE` could compute the checksum for `BIT` columns incorrectly. ([Bug#51304](#))
- `ALTER TABLE` on `InnoDB` tables (including partitioned tables) acquired exclusive locks on rows of the table being altered. If there was a concurrent transaction that did locking reads from this table, this sometimes led to a deadlock that was not detected by the metadata lock subsystem or by InnoDB (and was reported only after exceeding `innodb_lock_wait_timeout`). ([Bug#51263](#))
- A `HAVING` clause on a joined table in some cases failed to eliminate rows which should have been excluded from the result set. ([Bug#51242](#))
- Two sessions trying to set the global `event_scheduler` system variable to different values could deadlock. ([Bug#51160](#))
- `InnoDB` fast index creation could incorrectly use a table copy in some cases. ([Bug#50946](#))
- The Loose Index Scan optimization method assumed that it could depend on the partitioning engine to maintain interval endpoint information, as if it were a storage engine. ([Bug#50939](#))
- The type inference used for view columns caused some columns in views to be handled as the wrong type, as compared to the same columns in base tables. `DATE` columns in base tables were treated as `TIME` columns in views, and base table `TIME` columns as view `DATETIME` columns. ([Bug#50918](#))
- A syntactically invalid trigger could cause the server to crash when trying to list triggers. ([Bug#50755](#))
- Previously, the server held a global mutex while performing file operations such as deleting an `.frm` or data file, or reading table metadata from an `.frm` file or index statistics from a data file. Now the mutex is not held for these operations. Instead, the server uses metadata locks. ([Bug#50589](#), [Bug#51557](#), [Bug#49463](#))
- User-defined variables of type `REAL` that contained `NULL` were handled improperly when assigned to a column of another type. ([Bug#50511](#))
- Setting `--secure-file-priv` to the empty string left the value unaffected. ([Bug#50373](#))
- Calculation of intervals for Event Scheduler events was not portable. ([Bug#50087](#))
- The `YEAR` values `2000` and `0000` could be treated as equal. ([Bug#49910](#))
- Performing a single in-place `ALTER TABLE` containing `ADD INDEX` and `DROP INDEX` options that used the same index

name could result in a corrupt table definition file. Now such `ALTER TABLE` statements are no longer performed in place. ([Bug#49838](#))

- `mysql_upgrade` did not detect when `CSV` log tables incorrectly contained columns that could be `NULL`. Now these columns are altered to be `NOT NULL`. ([Bug#49823](#))
- `support-files/mysql.spec.sh` had unnecessary Perl dependencies. ([Bug#49723](#))
- Selecting from `INFORMATION_SCHEMA.ROUTINES` or `INFORMATION_SCHEMA.PARAMETERS` resulted in a memory leak. ([Bug#48729](#))
- In MySQL 5.1, `READ COMMITTED` was changed to use less locking due to the availability of row based binary logging (see the Note under `READ COMMITTED` at [Section 12.3.6, “SET TRANSACTION Syntax”](#)). However, `READ UNCOMMITTED` did not have the same change, so it was using more locks than the higher isolation level, which is unexpected. This was changed so that `READ UNCOMMITTED` now also uses the lesser amount of locking and has the same restrictions for binary logging. ([Bug#48607](#))
- On Intel x86 machines, the optimizer could choose different execution plans for a query depending on the compiler version and optimization flags used to build the server binary. ([Bug#48537](#))
- A trigger could change the behavior of assigning `NULL` to a `NOT NULL` column. ([Bug#48525](#))
- The server crashed when it could not determine the best execution plan for queries involving outer joins with nondeterministic `ON` clauses such as the ones containing the `RAND()` function, a user-defined function, or a `NOT DETERMINISTIC` stored function. ([Bug#48483](#))
- `EXPLAIN` could cause a server crash for some queries with subqueries. ([Bug#48419](#))
- The MERGE engine failed to open a child table from a different database if the child table or database name contained characters that were the subject of table name to filename encoding.

Further, the MERGE engine did not properly open a child table from the same database if the child table name contained characters such as '/', '#'. ([Bug#48265](#))

- On Windows, the server failed to find a description for Event ID 100. ([Bug#48042](#))
- A query that read from a derived table (of the form `SELECT ... FROM (SELECT ...)`) produced incorrect results when the following conditions were present:
 - The table subquery contained a derived query (`((SELECT ...) AS column)`).
 - The derived query could potentially produce zero rows or a single `NULL` (that is, no rows matched, or the query used an aggregate function such as `SUM()` running over zero rows).
 - The table subquery joined at least two tables.
 - The join condition involved an index.

([Bug#47904](#))
- The optimization to read `MIN()` or `MAX()` values from an index did not properly handle comparisons with `NULL` values. This could produce incorrect results for `MIN()` or `MAX()` when the `WHERE` clause tested a `NOT NULL` column for `NULL`. ([Bug#47762](#))
- Killing a query during the optimization phase of a subquery could cause a server crash. ([Bug#47761](#))
- Using `REPLACE` to update a previously inserted negative value in an `AUTO_INCREMENT` column in an `InnoDB` table caused the table auto-increment value to be updated to 2147483647. ([Bug#47720](#))
- The query shown by `EXPLAIN EXTENDED` plus `SHOW WARNINGS` could produce results different from the original query. ([Bug#47669](#))
- `MyISAM` could write uninitialized data to new index pages. Now zeros are written to unused bytes in the pages. ([Bug#47598](#))
- `OPTIMIZE TABLE` for an `InnoDB` table could raise an assertion if another session issued a concurrent `DROP TABLE`. ([Bug#47459](#))
- For updates to `InnoDB` tables, `TIMESTAMP` columns could be updated even when no values actually changed. ([Bug#47453](#))
- Setting `myisam_repair_threads` larger than 1 could result in the cardinality for all indexes of a `MyISAM` table being set to 1 after parallel index repair. ([Bug#47444](#))

- `mysqld_safe` did not always pass `--open-files-limit` through to `mysqld`. `mysqld_safe` did not treat dashes and underscores as equivalent in option names. ([Bug#47095](#))
- For events of `MYSQL_AUDIT_GENERAL_CLASS`, the event subclass was not passed to audit plugins even though the server passed the subclass to the plugin handler. The subclass is now available through the following changes:
 - The `struct mysql_event_general` structure has a new `event_subclass` member.
 - The new member changes the interface, so the audit plugin interface version, `MYSQL_AUDIT_INTERFACE_VERSION`, has been incremented from `0x0100` to `0x0200`. Plugins that require access to the new member must be recompiled to use version `0x0200` or higher.

The example plugin in the `plugin/audit_null` directory has been modified to count events of each subclass, based on the `event_subclass` value. See [Section 23.2.5.2, “Writing Audit Plugins”](#). ([Bug#47059](#))

- When the transaction isolation level was `REPEATABLE READ` and binary logging used statement or mixed format, `SELECT` statements with subqueries referencing `InnoDB` tables unnecessarily acquired shared locks on rows in these tables. ([Bug#46947](#))
- In debug builds, if the listed columns in the view definition of the table used in an `INSERT ... SELECT` statement mismatched, an assertion was raised in the query cache invalidation code following the failing statement. ([Bug#46615](#))
- For the `COMMIT` and `ROLLBACK` statements, the `AND CHAIN` and `RELEASE` modifiers should be mutually exclusive, but the parser allowed both to be specified. ([Bug#46527](#))
- If the server is started with `--skip-grant-tables`, plugin loading and unloading should be prohibited, but the server failed to reject `INSTALL PLUGIN` and `UNINSTALL PLUGIN` statements. ([Bug#46261](#))
- `gcc 4.4.0` could fail to compile `dtoa.c`. ([Bug#45882](#))
- `ALTER TABLE ... ADD COLUMN` for a table with multiple foreign keys caused a server crash. ([Bug#45052](#))
- Manual pages for a few little-used programs were missing from RPM packages. ([Bug#44370](#))
- Using an initial command with `mysql_options(..., MYSQL_INIT_COMMAND, ...)` that generated multiple result sets (such as a stored procedure or a multi-statement command) left the connection unusable. ([Bug#42373](#))
- The server could crash with an out of memory error when trying to parse a query that was too long to fit in memory. Now the parser rejects such queries with an `ER_OUT_OF_RESOURCES` error. ([Bug#42064](#))
- `InnoDB` could fail to create a unique index on `NULL` columns. ([Bug#41904](#))
- For a query that selected from a view and used an alias for the view, the metadata used the alias name rather than the view name in the `MYSQL_FIELD.table` member. ([Bug#41788](#))
- `mysql_upgrade` did not create temporary files properly. ([Bug#41057](#))
- It was possible for `DROP TABLE` of one `MyISAM` table to remove the data and index files of a different `MyISAM` table. ([Bug#40980](#))
- If the arguments to a `CONCAT()` call included a local routine variable, selecting the return value into a user variable could produce an incorrect result. ([Bug#40625](#))
- Column names displayed from the `PARTITION_EXPRESSION` column of the `INFORMATION_SCHEMA.PARTITIONS` table did not include escape characters as necessary. ([Bug#39338](#))
- When `SET TRANSACTION ISOLATION LEVEL` was used to set the isolation level for the next transaction, the level could persist for subsequent transactions. ([Bug#39170](#))
- When using `UNINSTALL PLUGIN` to remove a loaded plugin, open tables and connections caused `mysqld` to hang until the open connections had been closed. ([Bug#39053](#))
- Valgrind warnings in the `InnoDB compare_record()` function were corrected. ([Bug#38999](#))
- The optimizer sometimes used `filesort` for `ORDER BY` when it should have used an index. ([Bug#38745](#))
- Setting the session value of the `debug` system variable also set the global value. ([Bug#38054](#))
- Accessing a `MERGE` table with an empty underlying table list incorrectly resulted in a “wrong index” error message rather than “end of file.” ([Bug#35274](#))

- The test for `readline` during configuration failed when trying to build MySQL in a directory other than the source tree root. ([Bug#35250](#))
- `mysqld` could fail during execution when using SSL. ([Bug#34236](#))
- A query on a `FEDERATED` table in which the data was ordered by a `TEXT` column returned incorrect results. For example, a query such as the following would result in incorrect results if column `column1` was a `TEXT` column:

```
SELECT * FROM table1 ORDER BY column1;
```

([Bug#32426](#))

- MySQL Makefiles relied on GNU extensions. ([Bug#30708](#))
- The parser allocated too much memory for a query containing multiple statements. ([Bug#27863](#))
- The behavior of the RPM installation for both new installations and upgrade installations has changed.

During a new installation, the server boot scripts are installed, but the MySQL server is not started at the end of the installation, since the status of the system during an unattended installation is not known.

During an upgrade installation using the RPM packages, if the server is running when the upgrade occurs, the server is stopped, the upgrade occurs, and server is restarted. If the server is not already running when the RPM upgrade occurs, the server is not started at the end of the installation.

The boot scripts for MySQL are installed in the appropriate directories in `/etc`, so the MySQL server will be restarted automatically at the next machine reboot. ([Bug#27072](#))

- `ROW_COUNT()` returned a meaningful value only for some DML statements. Now it returns a value as follows:
 - DDL statements: 0. This applies to statements such as `CREATE TABLE` or `DROP TABLE`.
 - DML statements other than `SELECT`: The number of affected rows. This applies to statements such as `UPDATE`, `INSERT`, or `DELETE` (as before), but now also to statements such as `ALTER TABLE` and `LOAD DATA INFILE`.
 - `SELECT`: -1 if the statement returns a result set, or the number of rows “affected” if it does not. For example, for `SELECT * FROM t1, ROW_COUNT()` returns -1. For `SELECT * FROM t1 INTO OUTFILE 'file_name'`, `ROW_COUNT()` returns the number of rows written to the file.
 - `SIGNAL` statements: 0.

([Bug#21818](#))

D.1.7. Changes in MySQL 5.5.4 (09 April 2010)

InnoDB Notes:

- InnoDB has been upgraded to version 1.1. This version is considered of Beta quality.

For information about InnoDB features, see [Section 13.7, “New Features of InnoDB 1.1”](#). For general information about using InnoDB in MySQL, see [Section 13.6, “The InnoDB Storage Engine”](#).

Functionality added or changed:

- **InnoDB Storage Engine:** InnoDB now has a `innodb_use_native_aio` system variable that can be disabled at startup if there is a problem with the asynchronous I/O subsystem in the OS. This variable applies to Linux systems only, where the MySQL server now has a dependency on the `libaio` library.

Bugs fixed:

- **Performance: InnoDB Storage Engine:** The redo scan during InnoDB recovery used excessive CPU. The efficiency of this scan was improved, significantly speeding up crash recovery. ([Bug#49535](#), [Bug#29847](#))
- **Performance: InnoDB Storage Engine:** InnoDB page-freeing operations were made faster for compressed blocks, speeding up `ALTER TABLE`, `DROP TABLE`, and other operations on compressed tables that free compressed blocks. One symptom of

the older behavior could be 100% CPU use during these operations. ([Bug#35077](#))

- **InnoDB Storage Engine:** The AIX implementation of `readdir_r()` caused InnoDB errors. ([Bug#50691](#))
- **InnoDB Storage Engine:** The limit of 1023 concurrent data-modifying transactions has been raised. The limit is now 128 * 1023 concurrent transactions that generate undo records. You can remove any workarounds that require changing the proper structure of your transactions, such as committing more frequently or delaying DML operations to the end of a transaction. See [Section 13.7.7.19, “Better Scalability with Multiple Rollback Segments”](#). ([Bug#26590](#))
- A unique index on a column prefix could not be upgraded to a primary index even if there was no primary index already defined. ([Bug#51378](#))
- InnoDB did not reset table `AUTO_INCREMENT` values to the last used values after a server restart. ([Bug#49032](#))
- When using the `EXAMPLE` storage engine, when the engine had been built as a plugin (instead of built-in), and DTrace probes had been enabled during the build, loading the storage engine library would fail due to a missing object table entry.

D.1.8. Changes in MySQL 5.5.3 (24 March 2010 Milestone 3)

Performance Schema Notes:

- MySQL Server now includes Performance Schema, a feature for monitoring server execution at a low level. It is implemented using the `PERFORMANCE_SCHEMA` storage engine and the `performance_schema` database. Performance Schema focuses primarily on performance data. This differs from `INFORMATION_SCHEMA`, which serves for inspection of metadata. For more information, see [Chapter 21, MySQL Performance Schema](#).

Performance Schema support is included in binary MySQL distributions. It is disabled by default. To enable it, start the server with the `--performance_schema` option.

To create the `performance_schema` database if you are upgrading from an earlier release, run `mysql_upgrade` and restart the server. See [Section 4.4.7, “mysql_upgrade — Check Tables for MySQL Upgrade”](#).

InnoDB Notes:

- This release includes InnoDB 1.0.6. This version is considered of Release Candidate (RC) quality.

Functionality added or changed:

- **Performance:** The performance of internal functions that trim multiple spaces from strings when comparing them has been improved. ([Bug#14637](#))
- **Incompatible Change:** `CREATE VIEW` and `DROP VIEW` now are prohibited while a `LOCK TABLES` statement is in effect. ([Bug#56571](#))
- **Incompatible Change:** The following obsolete constructs have been removed. Where alternatives are shown, applications should be updated to use them.
 - The `log_bin_trust_routine_creators` system variable (use `log_bin_trust_function_creators`).
 - The `myisam_max_extra_sort_file_size` system variable.
 - The `record_buffer` system variable (use `read_buffer_size`).
 - The `sql_log_update` system variable.
 - The `table_type` system variable (use `storage_engine`).
 - The `FRAC_SECOND` modifier for the `TIMESTAMPADD()` function.
 - The `TYPE` table option to specify the storage engine for `CREATE TABLE` or `ALTER TABLE` (use `ENGINE`).
 - The `SHOW TABLE TYPES` SQL statement (use `SHOW ENGINES`).
 - The `SHOW INNODB STATUS` and `SHOW MUTEX STATUS` SQL statements (use `SHOW ENGINE INNODB STATUS` `SHOW ENGINE INNODB MUTEX`).

- The `SHOW PLUGIN` SQL statement (use `SHOW PLUGINS`).
- The `LOAD TABLE ... FROM MASTER` and `LOAD DATA FROM MASTER` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).
- The `BACKUP TABLE` and `RESTORE TABLE` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).
- `TIMESTAMP(N)` data type: The ability to specify a display width of `N` (use without `N`).
- The `--default-character-set` and `--default-collation` server options (use `--character-set-server` and `--collation-server`).
- The `--delay-key-write-for-all-tables` server option (use `--delay-key-write=ALL`).
- The `--enable-locking` and `--skip-locking` server options (use `--external-locking` and `--skip-external-locking`).
- The `--log-bin-trust-routine-creators` server option (use `--log-bin-trust-function-creators`).
- The `--log-long-format` server option.
- The `--log-update` server option.
- The `--master-xxx` server options to set replication parameters (use the `CHANGE MASTER TO` statement instead): `--master-host`, `--master-user`, `--master-password`, `--master-port`, `--master-connect-retry`, `--master-ssl`, `--master-ssl-ca`, `--master-ssl-capath`, `--master-ssl-cert`, `--master-ssl-cipher`, `--master-ssl-key`.
- The `--safe-show-database` server option.
- The `--skip-symlink` and `--use-symbolic-links` server options (use `--skip-symbolic-links` and `--symbolic-links`).
- The `--sql-bin-update-same` server option.
- The `--warnings` server option (use `--log-warnings`).
- The `--no-named-commands` option for `mysql` (use `--skip-named-commands`).
- The `--no-pager` option for `mysql` (use `--skip-pager`).
- The `--no-tee` option for `mysql` (use `--skip-tee`).
- The `--position` option for `mysqlbinlog` (use `--start-position`).
- The `--all` option for `mysqldump` (use `--create-options`).
- The `--first-slave` option for `mysqldump` (use `--lock-all-tables`).
- The `--config-file` option for `mysqld_multi` (use `--defaults-extra-file`).
- The `--set-variable=var_name=value` and `-O var_name=value` general-purpose options for setting program variables (use `--var_name=value`).

(Bug#48048)

See also Bug#47974, Bug#56408.

- **Incompatible Change:** Aliases for wildcards (as in `SELECT t.* AS 'alias' FROM t`) are no longer accepted and result in an error. Previously, such aliases were ignored silently. (Bug#27249)
- **Incompatible Change:** Implicit conversion of a number or temporal value to string now produces a value that has a character set and collation determined by the `character_set_connection` and `collation_connection` system variables. (These variables commonly are set with `SET NAMES`. For information about connection character sets, see [Section 9.1.4, “Connection Character Sets and Collations”](#).)

This means that such a conversion results in a character (nonbinary) string (a `CHAR`, `VARCHAR`, or `LONGTEXT` value), except in the case that the connection character set is set to `binary`. In that case, the conversion result is a binary string (a `BINARY`, `VARBINARY`, or `LONGBLOB` value).

Previously, an implicit conversion always produced a binary string, regardless of the connection character set. Such implicit conversions to string typically occur for functions that are passed numeric or temporal values when string values are more usual, and thus could have effects beyond the type of the converted value. Consider the expression `CONCAT(1, 'abc')`. The numeric argument `1` was converted to the binary string `'1'` and the concatenation of that value with the nonbinary string `'abc'` produced the binary string `'1abc'`.

This change in conversion behavior affects several functions that expect string arguments because a numeric or temporal argument converted to a string now results in a character rather than binary string argument:

- String functions: `CONCAT()`, `CONCAT_WS()`, `ELT()`, `EXPORT_SET()`, `INSERT()`, `LCASE()`, `LEFT()`, `LOWER()`, `LPAD()`, `LTRIM()`, `MID()`, `QUOTE()`, `REPEAT()`, `REPLACE()`, `REVERSE()`, `RIGHT()`, `RPAD()`, `RTRIM()`, `SOUNDEX()`, `SUBSTRING()`, `TRIM()`, `UCASE()`, `UPPER()`.
- Date and time functions: `ADDDATE()`, `ADDTIME()`, `DATE_ADD()`, `DATE_SUB()`, `DAYNAME()`, `GET_FORMAT()`, `MONTHNAME()`, `SUBDATE()`, `SUBTIME()`, `TIMESTAMPADD()`.

These functions remain unaffected:

- `CHAR()` without a `USING` clause still returns `VARBINARY`.
- Functions that previously returned `utf8` strings still do so. Examples include `CHARSET()` and `COLLATION()`.

Encryption and compression functions that expect string arguments and previously returned binary strings are affected depending on the content of the return value:

- If the return value contains only ASCII characters, the function now returns a character string with the connection character set and collation: `MD5()`, `OLD_PASSWORD()`, `PASSWORD()`, `SHA()`, `SHA1()`. The `ASTEXT()` and `ASWKT()` spatial functions also fall into this category.
- If the return value can contain non-ASCII characters, the function still returns a binary string: `AES_ENCRYPT()`, `CMPRESS()`, `DES_ENCRYPT()`, `ENCODE()`, `ENCRYPT()`.

The `INET_NTOA()` return value contains only ASCII characters, and this function now returns a character string with the connection character set and collation rather than a binary string.

- **Incompatible Change:** Several changes were made to processing of server system variables and command-line options to make their treatment more consistent.

General changes:

- The help message text displayed by `mysqld --verbose --help` now consistently uses dashes to show the names of options and system variables that can be set at server startup. Previously, the message used both dashes and underscores (generally with dashes for options and underscores for system variables). For example, the help message now displays `--log-output` and `--general-log`, whereas previously it displayed `--log-output` and `--general_log`.

This is a display-only change. The permissible syntax for setting options and variables remains unchanged:

- At server startup, you can specify options and variables on the command line or in option files using either dashes or underscores.
- For those system variables that can be set at runtime (for example, using `SET`), you must specify them using underscores.
- There are fewer session-only system variables. These variables now have a global value: `autocommit`, `foreign_key_checks`, `profiling`, `sql_auto_is_null`, `sql_big_selects`, `sql_buffer_result`, `sql_log_bin`, `sql_log_off`, `sql_notes`, `sql_quote_show_create`, `sql_safe_updates`, `sql_warnings`, `unique_checks`.

For those variables, you can now set the global value to change the value from which the session value is initialized for new sessions.

The following list shows the variables that remain session-only. They apply only in the context of a specific session so that a global value is of no use: `debug_sync`, `error_count`, `identity`, `insert_id`, `last_insert_id`, `pseudo_thread_id`, `rand_seed1`, `rand_seed2`, `timestamp`, `warning_count`.

- All system variables are accessible at runtime using `@@` syntax (`@@GLOBAL.var_name`, `@@SESSION.var_name`, `@@var_name`). Previously, this syntax produced an error for some variables.
- All system variables are included as appropriate in the output from `SHOW {GLOBAL, SESSION} VARIABLES` and the `INFORMATION_SCHEMA.GLOBAL_VARIABLES` and `INFORMATION_SCHEMA.SESSION_VARIABLES` tables. Pre-

viously, some variables were not displayed.

- “As appropriate” in the preceding item means that `SHOW GLOBAL VARIABLES` and `INFORMATION_SCHEMA.GLOBAL_VARIABLES` no longer include session-only system variables. Previously, these included the global value of a variable if it had one, and the session value if not. (`SHOW SESSION VARIABLES` still includes global-only variables.)
- The server now enforces type checking for assignments to system variables, so it is more consistent and strict about rejecting invalid values.
- For attempts to assign a negative value to an unsigned system variable, the server truncates the value to the minimum permitted value. Previously, there was sometimes wraparound to a large positive value.
- Some system variables (typically those that control memory or disk allocation) are permitted to take only values that are a multiple of a given block size, and assigning a value not a block size multiple causes truncation to the nearest multiple. (For example, `net_buffer_length` must be a multiple of 1024. Assigning 16384 results in a value of 16384, whereas assigning 16383 results in a value of 15360.) A warning now occurs when adjustment of the specified value takes place. Previously, adjustment was silent.
- More system variables can be assigned the value `DEFAULT` to set them to their default value. Previously, this syntax produced an error in some cases.
- All variables that have a `SET` data type value can be set to an integer value that is treated like a bit mask. Previously, this did not work for some SET-type variables.
- The default value for several system variables no longer differs between 32-bit and 64-bit builds. Previously, the values differed by about 100 bytes for some variables.
- There are no longer any write-only system variables. For example, `SELECT @@rand_seed1` returns 0, not `Variable 'rand_seed1' can only be set, not read`.

Variable-specific changes:

- The `concurrent_insert` system variable now is handled as an enumeration with the permissible values `NEVER`, `AUTO`, and `ALWAYS`. The corresponding integer values 0, 1, and 2 are still recognized.
- The `completion_type` system variable now is handled as an enumeration with the permissible values `NO_CHAIN`, `CHAIN`, and `RELEASE`. The corresponding integer values 0, 1, and 2 are still recognized.
- For `concurrent_insert` and `completion_type`, the string form of the value is displayed by `SHOW VARIABLES` and `SELECT @@var_name`.
- The unused `rpl_recovery_rank` system variable is deprecated.
- The `storage_engine` system variable is deprecated in favor of the new system variable `default_storage_engine`. This enables pairing of the `--default-storage-engine` command-line option with a system variable of a more closely corresponding name.
- The `--myisam-recover` option is renamed to `--myisam-recover-options` to pair better with the name of the `myisam_recover_options` system variable. The old option name still works because it is recognized as an unambiguous prefix of the new name. (Option prefix recognition occurs as described in [Section 4.2.3, “Specifying Program Options”](#).)
- `--myisam-recover-options` has a new permissible value `OFF`.
- Attempts to drop the default key cache produce an error. Previously, it produced only a warning and status of success even though the attempt failed.

See also [Bug#34437](#), [Bug#34635](#).

- **Incompatible Change:** `FLUSH TABLES` has a new variant, `FLUSH TABLES tbl_list WITH READ LOCK`. This variant enables tables to be flushed and locked in a single operation. It provides a workaround for the restriction (due to work done for [Bug#989](#)) that `FLUSH TABLES` is not permitted when there is an active `LOCK TABLES ... READ`.

See also [Bug#42465](#).

- **Incompatible Change:** The server now includes `dtoa`, a library for conversion between strings and numbers by David M. Gay. In MySQL, this library provides the basis for improved conversion between string or `DECIMAL` values and approximate-value (`FLOAT`/`DOUBLE`) numbers:

- Consistent conversion results across platforms, which eliminates, for example, Unix versus Windows conversion differences.
- Accurate representation of values in cases where results previously did not provide sufficient precision, such as for values close to IEEE limits.
- Conversion of numbers to string format with the best possible precision. The precision of `dtoa` is always the same or better than that of the standard C library functions.

Because the conversions produced by this library differ in some cases from previous results, the potential exists for incompatibilities in applications that rely on previous results. For example, applications that depend on a specific exact result from previous conversions might need adjustment to accommodate additional precision.

For additional information about the properties of `dtoa` conversions, see [Section 11.2, “Type Conversion in Expression Evaluation”](#).

See also [Bug#12860](#), [Bug#21497](#), [Bug#26788](#), [Bug#24541](#), [Bug#34015](#).

- **Incompatible Change:** The Unicode implementation has been extended to provide support for supplementary characters that lie outside the Basic Multilingual Plane (BMP). Noteworthy features:
 - `utf16` and `utf32` character sets have been added. These correspond to the UTF-16 and UTF-32 encodings of the Unicode character set, and they both support supplementary characters.
 - The `utf8mb4` character set has been added. This is similar to `utf8`, but its encoding allows up to four bytes per character to enable support for supplementary characters.
 - The `ucs2` character set is essentially unchanged except for the inclusion of some newer BMP characters.

In most respects, upgrading to MySQL 5.5 should present few problems with regard to Unicode usage, although there are some potential areas of incompatibility. These are the primary areas of concern:

- For the variable-length character data types (`VARCHAR` and the `TEXT` types), the maximum length in characters is less for `utf8mb4` columns than for `utf8` columns.
- For all character data types (`CHAR`, `VARCHAR`, and the `TEXT` types), the maximum number of characters that can be indexed is less for `utf8mb4` columns than for `utf8` columns.

Consequently, if you want to upgrade tables from `utf8` to `utf8mb4` to take advantage of supplementary-character support, it may be necessary to change some column or index definitions.

For additional details about the new Unicode character sets and potential incompatibilities, see [Section 9.1.10, “Unicode Support”](#), and [Section 9.1.11, “Upgrading from Previous to Current Unicode Support”](#).

- **Incompatible Change:** Several columns were added to the `INFORMATION_SCHEMA.ROUTINES` table to provide information about the `RETURNS` clause data type for stored functions: `DATA_TYPE`, `CHARACTER_MAXIMUM_LENGTH`, `CHARACTER_OCTET_LENGTH`, `NUMERIC_PRECISION`, `NUMERIC_SCALE`, `CHARACTER_SET_NAME`, and `COLLATION_NAME`.

This change produces an incompatibility for applications that depend on column order in the `ROUTINES` table because the new columns appear between the `ROUTINE_TYPE` and `DTD_IDENTIFIER` columns. Such applications may need to be adjusted to account for the new columns.

- **Important Change: Replication:** `RESET MASTER` and `RESET SLAVE` now reset the values shown for `Last_IO_Error`, `Last_IO_Errno`, `Last_SQL_Error`, and `Last_SQL_Errno` in the output of `SHOW SLAVE STATUS`. ([Bug#34654](#))

See also [Bug#44270](#).

- **Important Change:** The `--skip-thread-priority` option is now deprecated such that the server won't change the thread priorities by default. Giving threads different priorities might yield marginal improvements in some platforms (where it actually works), but it might instead cause significant degradation depending on the thread count and number of processors. Meddling with the thread priorities is a not a safe bet as it is very dependent on the behavior of the CPU scheduler and system where MySQL is being run. ([Bug#35164](#), [Bug#37536](#))
- **Cluster Replication: Replication:** MySQL Replication now supports attribute promotion and demotion for row-based replication between columns of different but similar types on the master and the slave. For example, it is possible to promote an `INT` column on the master to a `BIGINT` column on the slave, and to demote a `TEXT` column to a `VARCHAR` column.

The implementation of type demotion distinguishes between lossy and non-lossy type conversions, and their use on the slave can be controlled by setting the `slave_type_conversions` global server system variable.

For more information, see [Row-based replication: attribute promotion and demotion. \(Bug#47163, Bug#46584\)](#)

- **Replication:** For replication based on row-based and mix-format binary logging, it is now safe to mix transactional and non-transactional statements within a transaction. The nontransactional statements are logged immediately rather than waiting until the transaction ends, ensuring that their results are logged and replicated correctly regardless of the result of the transaction.
- `mysqltest` has a new `--max-connections` option to set a higher number of maximum permitted server connections than the default 128. This option can also be passed using `mysql-test-run.pl`. ([Bug#51135](#))
- `mysql-test-run.pl` has a new `--portbase` option and a corresponding `MTR_PORT_BASE` environment variable for setting the port range, as an alternative to the existing `--build-thread` option. ([Bug#50182](#))
- `SHOW PROFILE CPU` has been ported to Windows. Thanks to Alex Budovski for the patch. ([Bug#50057](#))
- `mysql-test-run.pl` has a new `--gprof` option that runs the server through the `gprof` profiler, much the same way the currently supported `--gcov` option runs it through `gcov`. ([Bug#49345](#))
- `mysqltest` has a new `lowercase_result` command that converts the output of the next statement to lowercase. This is useful for test cases where the lettercase may vary between platforms. ([Bug#48863](#))
- `mysqltest` has a new `remove_files_wildcard` command that removes files matching a pattern from a directory. ([Bug#39774](#))
- MySQL support for adding collations using LDML specifications did not support the `<i>` identity rule that indicates one character sorts identically to another. The `<i>` rule now is supported. ([Bug#37129](#))
- For boolean options, the option-processing library now prints additional information in the `--help` message: If the option is enabled by default, the message says so and indicates that the `--skip` form of the option disables the option. This affects all compiled MySQL programs that use the library. ([Bug#35224](#))
- The use of the `SQL_CACHE` and `SQL_NO_CACHE` options in `SELECT` statements now is checked more restrictively: 1) Previously, both options could be given in the same statement. This is no longer true; only one can be given. 2) Previously, these options could be given in `SELECT` statements that were not at the top-level. This is no longer true; the options are not permitted in subqueries (including subqueries in the `FROM` clause, and `SELECT` statements in unions other than the first `SELECT`). ([Bug#35020](#))
- Added the `--auto-vertical-output` option to `mysql` which causes result sets to be displayed vertically if they are too wide for the current window, and using normal tabular format otherwise. (This applies to statements terminated by `;` or `\G`.) ([Bug#26780](#))
- `TRUNCATE TABLE` now is permitted for a table for which a `WRITE` lock has been acquired with `LOCK TABLES`. ([Bug#20667](#))

See also [Bug#46452](#).

- `FLUSH LOGS` now takes an optional `log_type` value so that `FLUSH log_type LOGS` can be used to flush only a specified log type. These `log_type` options are permitted:
 - `BINARY` closes and reopens the binary log files.
 - `ENGINE` closes and reopens any flushable logs for installed storage engines.
 - `ERROR` closes and reopens the error log file.
 - `GENERAL` closes and reopens the general query log file.
 - `RELAY` closes and reopens the relay log files.
 - `SLOW` closes and reopens the slow query log file.

Thanks to Eric Bergen for the patch to implement this feature. ([Bug#14104](#))

- Previously, prepared `CALL` statements could be used through the C API only for stored procedures that produce at most one result set, and applications could not use placeholders for `OUT` or `INOUT` parameters. For prepared `CALL` statements used using `PREPARE` and `EXECUTE`, placeholders could not be used for `OUT` or `INOUT` parameters.

For the C API, prepared `CALL` support now is expanded in the following ways:

- A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.

- The final values of `OUT` and `INOUT` parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the `OUT` and `INOUT` parameters in the order in which they are declared in the procedure parameter list.
- A new C API function, `mysql_stmt_next_result()`, is available for processing stored procedure results. See [Section 22.9.16, “C API Support for Prepared CALL Statements”](#).
- The `CLIENT_MULTI_RESULTS` flag now is enabled by default. It no longer needs to be enabled when you call `mysql_real_connect()`. (This flag is necessary for executing stored procedures because they can produce multiple result sets.)

For `PREPARE` and `EXECUTE`, placeholder support for `OUT` and `INOUT` parameters is now available. See [Section 12.2.1, “CALL Syntax”](#). ([Bug#11638](#), [Bug#17898](#))

- MySQL now supports IPv6 connections to the local host, using the address `::1`. For example:

```
shell> mysql -h ::1
```

The address `::1` can be specified in account names in statements such as `CREATE USER`, `GRANT`, and `REVOKE`. For example:

```
mysql> CREATE USER 'bill'@'::1' IDENTIFIED BY 'secret';
mysql> GRANT SELECT ON mydb.* TO 'bill'@'::1';
```

The default set of accounts created during MySQL installation now includes an account for `'root'@'::1'`.

See [Section 5.4.3, “Specifying Account Names”](#), and [Section 2.10.2, “Securing the Initial MySQL Accounts”](#). ([Bug#8836](#))

- Three options were added to `mysqldump` make it easier to generate a dump from a slave server:
 - `--dump-slave` is similar to `--master-data`, but the `CHANGE MASTER TO` statement contains binary log coordinates for the slave's master host, not the slave itself.
 - `--apply-slave-statements` causes `STOP SLAVE` and `START SLAVE` statements to be added before the `CHANGE MASTER TO` statement and at the end of the output, respectively.
 - `--include-master-host-port` causes the `CHANGE MASTER TO` statement to include `MASTER_PORT` and `MASTER_HOST` options for the slave's master.

([Bug#8368](#))

- `mysqladmin` now permits the password value to be omitted following the `password` command. In this case, `mysqladmin` prompts for the password value, which enables you to avoid specifying the password on the command line. Omitting the password value should be done only if `password` is the final command on the `mysqladmin` command line. Otherwise, the next argument is taken as the password. ([Bug#5724](#))
- The `optimizer_switch` system variable has a new `engine_condition_pushdown` flag to control whether storage engine condition pushdown optimization is used. The `engine_condition_pushdown` system variable now is deprecated.
- The server now provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match. For more information, see [Section 23.2.3.5, “Audit Plugins”](#).
- Some conversions between Japanese character sets are more efficient.
- When the server detects `MyISAM` table corruption, it now writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: [Got an error from thread_id=1, mi_dynrec.c:368](#). This is useful information to include in bug reports.
- The `TABLESPACES` table has been added to `INFORMATION_SCHEMA` for tracking tablespace details.
- Added the `PARAMETERS` table to `INFORMATION_SCHEMA`. The `PARAMETERS` table provides information about stored procedure and function parameters, and about return values for stored functions.
- The maximum length of table comments was extended from 60 to 2048 characters. The maximum length of column comments was extended from 255 to 1024 characters. Index definitions now can include a comment of up to 1024 characters.

Bugs fixed:

- **Performance: Replication:** When writing events to the binary log, transactional events (that is, events that operate on transactional tables) are written to a thread-specific transaction cache, which is then written to the binary log on commit. To handle nontransactional events, there was a lock taken on the binary log (when entering the function `MYSQL_BIN_LOG::write()`), even when the event was written to the transaction cache instead of the binary log, causing a major bottleneck in replication performance. ([Bug#42757](#))
- **Security Fix:** The server crashed if an account with the `CREATE ROUTINE` privilege but not the `EXECUTE` privilege attempted to create a stored procedure. ([Bug#44798](#))
- **Security Enhancement:** When the `DATA DIRECTORY` or `INDEX DIRECTORY` clause of a `CREATE TABLE` statement referred to a subdirectory of the data directory through a symlinked component of the data directory path, it was accepted, when for security reasons it should be rejected. ([Bug#39277](#))
- **Incompatible Change: Replication:** The `--binlog_format` system variable can no longer be set inside a transaction. In other words, the binary logging format can no longer be changed while a transaction is in progress. ([Bug#47863](#))
- **Incompatible Change: Replication:** Concurrent statements using a stored function and `DROP FUNCTION` for that function could break statement-based replication.

DDL statements for stored procedures and functions are now prohibited while a `LOCK TABLES` statement is in effect. ([Bug#30977](#))

See also [Bug#57663](#).

- **Incompatible Change:** For debug builds, attempts to execute `RESET` statements within a transaction that had acquired metadata locks led to an assertion failure.

As a result of this bug fix, `RESET` statements now cause an implicit commit. ([Bug#51336](#))

- **Incompatible Change:** A deadlock occurred for this sequence of events: Session 1 locked a table using `LOCK TABLES`; Session 2 dropped the database containing the table; Session 1 created any database.

A consequence of this bug fix is that `CREATE DATABASE` is not permitted within a session that has an active `LOCK TABLES` statement. ([Bug#49988](#))

- **Incompatible Change:** `CREATE TABLE` statements (including `CREATE TABLE ... LIKE`) are now prohibited whenever a `LOCK TABLES` statement is in effect. ([Bug#42546](#))
- **Incompatible Change:** For application compatibility reasons, when `sql_auto_is_null` is 1, MySQL converts `auto_inc_col IS NULL` to `auto_inc_col = LAST_INSERT_ID()`. However, this was being done regardless of whether the predicate was alone or at the top level. Now it occurs only when it is a single top-level predicate.

In conjunction with this bug fix, the default value of the `sql_auto_is_null` system variable has been changed from 1 to 0, which may cause incompatibilities with existing applications. ([Bug#41371](#))

- **Incompatible Change:** The parser accepted illegal syntax in a `FOREIGN KEY` clause:
 - Multiple `MATCH` clauses.
 - Multiple `ON DELETE` clauses.
 - Multiple `ON UPDATE` clauses.
 - `MATCH` clauses specified after `ON UPDATE` or `ON DELETE`. In case of multiple redundant clauses, this leads to confusion, and implementation-dependent results.

These illegal syntaxes are now properly rejected. Existing applications that used them will require adjustment. ([Bug#34455](#))

- **Incompatible Change:** The parser accepted an `INTO` clause in nested `SELECT` statements, which is invalid because such statements must return their results to the outer context. This syntax is no longer permitted. ([Bug#33204](#))
- **Incompatible Change:** The `Locked` thread state was equivalent to the `Table lock` state and has been removed. It no longer appears in `SHOW PROCESSLIST` output. ([Bug#28870](#))
- **Incompatible Change:** Several changes were made to alias resolution in multiple-table `DELETE` statements so that it is no longer possible to have inconsistent or ambiguous table aliases.
 - In MySQL 5.1.23, alias declarations outside the `table_references` part of the statement were disallowed for the `US-`

TING variant of multiple-table `DELETE` syntax, to reduce the possibility of ambiguous aliases that could lead to ambiguous statements that have unexpected results such as deleting rows from the wrong table.

Now alias declarations outside `table_references` are disallowed for all multiple-table `DELETE` statements. Alias declarations are permitted only in the `table_references` part.

Incorrect:

```
DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
DELETE t1 AS a2 FROM t1 AS a1 INNER JOIN t2 AS a2;
```

Correct:

```
DELETE FROM t1 USING t1 AS a1 INNER JOIN t2 AS a2;
DELETE t1 FROM t1 AS a1 INNER JOIN t2 AS a2;
```

- Previously, for alias references in the list of tables from which to delete rows in a multiple-table delete, the default database is used unless one is specified explicitly. For example, if the default database is `db1`, the following statement does not work because the unqualified alias reference `a2` is interpreted as having a database of `db1`:

```
DELETE a1, a2 FROM db1.t1 AS a1 INNER JOIN db2.t2 AS a2
WHERE a1.id=a2.id;
```

To correctly match an alias that refers to a table outside the default database, you must explicitly qualify the reference with the name of the proper database:

```
DELETE a1, db2.a2 FROM db1.t1 AS a1 INNER JOIN db2.t2 AS a2
WHERE a1.id=a2.id;
```

Now alias resolution does not require qualification and alias references should not be qualified with the database name. Qualified names are interpreted as referring to tables, not aliases.

Statements containing alias constructs that are no longer permitted must be rewritten. ([Bug#27525](#))

See also [Bug#30234](#).

- Incompatible Change:** `DROP TABLE` now is permitted only if you have acquired a `WRITE` lock with `LOCK TABLES`, or if you hold no locks, or if the table is a `TEMPORARY` table.

Previously, if other tables were locked, you could drop a table with a read lock or no lock, which could lead to deadlocks between clients. The new stricter behavior means that some usage scenarios will fail when previously they did not. ([Bug#25858](#))

- Incompatible Change:** If a data definition language (DDL) statement occurred for a table that was being used by another session in an active transaction, statements could be written to the binary log in the wrong order. For example, this could happen if `DROP TABLE` occurred for a table being used in a transaction. This is now prevented by deferring release of metadata locks on tables used within a transaction until the transaction ends.

This bug fix results in some incompatibilities with previous versions:

- A table that is being used by a transaction within one session cannot be used in DDL statements by other sessions until the transaction ends.
- `FLUSH TABLES` is not permitted when there is an active `LOCK TABLES ... READ`. Use `FLUSH TABLES tbl_list WITH READ LOCK` instead. This causes a problem with `mysqlhotcopy`, fixed in [Bug#42465](#). ([Bug#989](#), [Bug#39675](#))
- Important Change: Replication:** For an engine that supported only row-based replication, replication stopped with an error when executing row events.

For information about changes in how the binary logging format is determined in relation to statement type and storage engine logging capabilities, see [Section 5.2.4.3, “Mixed Binary Logging Format”](#).

As part of the fix for this issue, the `EXAMPLE` storage engine is now changed so that it supports statement-based logging only. Previously, it supported row-based logging only. ([Bug#39934](#))

- Important Change:** The IPv6 loopback address `::1` was interpreted as a hostname rather than a numeric IP address.

In addition, the IPv6-enabled server on Windows interpreted the hostname `localhost` as `::1` only, which failed to match the

default '`root`'@'127.0.0.1' account in the `mysql.user` privilege table.

Note

As a result of this fix, a '`root`'@':1' account is added to the `mysql.user` table as one of the default accounts created during MySQL installation.

([Bug#43006](#))

See also [Bug#38247](#), [Bug#45283](#), [Bug#45584](#), [Bug#45606](#).

- **InnoDB Storage Engine: Replication:** Column length information generated by `InnoDB` did not match that generated by `MyISAM`, which caused invalid metadata to be written to the binary log when trying to replicate `BIT` columns. ([Bug#49618](#))
- **InnoDB Storage Engine:** `SHOW INNODB STATUS` could display incorrect information about deadlocks, when the deadlock detection routine stops early (to avoid excessive CPU usage). ([Bug#49001](#))
- **InnoDB Storage Engine:** Concurrent execution of `ALTER TABLE` for `InnoDB` table and a transaction that tried to read and then update the table could result in a deadlock between table-level locks and `InnoDB` row locks, which was detected only after the `innodb_lock_wait_timeout` timeout occurred. ([Bug#37346](#))
- **Partitioning:** When using a debug build of MySQL, if a query against a partitioned table having an index on one or more `DOUBLE` columns used that index, the server failed with an assertion. ([Bug#45816](#))
- **Partitioning:** The first time that a query against the `INFORMATION_SCHEMA.TABLES` table for partitioned tables using the `ARCHIVE` engine was run, it returned invalid data. If the server had been restarted since such a table had been created, or if the table had never actually been opened, its `DATA_LENGTH` was reported as 0 bytes. (The second and subsequent attempts to issue the same query returned the expected result.) ([Bug#44622](#))
- **Partitioning:** `ALTER TABLE` on a partitioned table caused unnecessary deadlocks. ([Bug#43867](#))

See also [Bug#46654](#).

- **Partitioning:** Attempting to drop a partitioned table from one connection while waiting for the completion of an `ALTER TABLE` that had been issued from a different connection, and that changed the storage engine used by the table, could cause the server to crash. ([Bug#42438](#))
- **Partitioning:** After attempting to create a duplicate index on a partitioned table (and having the attempt fail as expected), a subsequent attempt to create a new index on the table caused the server to hang. ([Bug#40181](#))
- **Partitioning:** When used on a partitioned table, `ALTER TABLE` produced the wrong error message when the name of a nonexistent storage engine was used in the `ENGINE` clause. ([Bug#35765](#))
- **Partitioning:** When one user was in the midst of a transaction on a partitioned table, a second user performing an `ALTER TABLE` on this table caused the server to hang. ([Bug#34604](#))
- **Partitioning:** Portions of the partitioning code were refactored in response to potential regression issues uncovered while working on the fix for [Bug#31210](#). ([Bug#32115](#))

See also [Bug#40281](#).

- **Replication:** When using the row-based or mixed replication format with a debug build of the MySQL server, inserts into columns using the `UTF32` character set on the master caused the slave to crash. ([Bug#51787](#))
- **Replication:** See also [Bug#51716](#).
- **Replication:** When using the row-based or mixed replication format, column values using the `UTF16` character set on the master were padded incorrectly on the slave. ([Bug#51716](#))
- **Replication:** See also [Bug#51787](#).
- **Replication:** An issue internal to the code, first seen in [Bug#49132](#) but not completely resolved in the fix for that bug, was removed. This should prevent similar issues to those in the previous bug with `binlog_format` changes following DDL statements.

For developers working with the MySQL Server code: the public class variable `THD::current_stmt_binlog_row_based` was supposed to have been removed as part of the fix for [Bug#39934](#), but was still present in the code. If a developer later tried to use this variable, it could cause the previous issues to re-occur, and possibly new ones to arise. The variable has now been removed; the previously added class functions `THD::is_current_stmt_binlog_format_row()`, `THD::set_current_stmt_binlog_format_row()`, and `THD::clear_current_stmt_binlog_format_row()` should be used instead. ([Bug#51021](#))

- **Replication:** Adding an index to a table on the master caused the slave to stop logging slow queries to the slow query log. ([Bug#50620](#))
- **Replication:** If a `CHANGE MASTER TO` statement set `MASTER_HEARTBEAT_PERIOD` to 30 or higher, `Slave_received_heartbeats` did not increase on the slave. This caused the slave to reconnect before the time indicated by `slave_net_timeout` had elapsed.

This issue affected big-endian 64-bit platforms such as Solaris/SPARC. ([Bug#50296](#))

- **Replication:** The error message given when trying to replicate (using statement-based mode) insertions into an `AUTO_INCREMENT` column by a stored function or a trigger was improved. ([Bug#50192](#))
- **Replication:** The server could deadlock when `FLUSH LOGS` was executed concurrently with DML statements. To fix this problem, nontransactional changes are now always flushed before transactional changes. ([Bug#50038](#))
- **Replication:** Metadata for `GEOMETRY` fields was not properly stored by the slave in its definitions of tables. ([Bug#49836](#))

See also [Bug#48776](#).

- **Replication:** Statement-based replication of user variables having numeric data types did not always work correctly. ([Bug#49562](#))
- **Replication:** When using the semi-synchronous replication plugin on Windows, the wait time calculated when the master was waiting for reply from the slave was incorrect. In addition, when the wait time was less than the current time, the master did not wait for a reply at all.

This issue was caused by the fact that a different internal function was used to get current time by the plugin on Windows as opposed to other platforms, and this function was not correctly implemented. Now the Windows version of the plugin uses the same function as other platforms for this purpose. ([Bug#49557](#))

- **Replication:** Due to a change in the format of the information used by the slave to connect to the master, which could cause to reject connection attempts to older masters by newer slaves. ([Bug#49259](#))

This regression was introduced by [Bug#13963](#).

- **Replication:** When using row-based logging, a failing `INSERT...SELECT` statement on a nontransactional table was not flagged correctly, such that, if a rollback was requested and no other nontransactional table had been updated, nothing was written to the binary log. ([Bug#47175](#))

See also [Bug#40278](#).

- **Replication:** When using row-based replication, the incomplete logging of a group of events involving both transaction and nontransactional tables could cause `STOP SLAVE` to hang. ([Bug#45940](#))

See also [Bug#319](#), [Bug#38205](#).

- **Replication:** There were two related issues concerning handling of unsafe statements and setting of the binary logging format when there were open temporary tables on the master, and the existing replication format was row-based or mixed:

1. When using `binlog_format=ROW`, and an unsafe statement was executed while there were open temporary tables on the master, the statement `SET @@session.binlog_format = MIXED` failed with the error `CANNOT SWITCH OUT OF THE ROW-BASED BINARY LOG FORMAT WHEN THE SESSION HAS OPEN TEMPORARY TABLES`.
2. When using `binlog_format=MIXED`, and an unsafe statement was executed while there were open temporary tables on the master, the statement `SET @@session.binlog_format = STATEMENT` caused any subsequent DML statements to be written to the binary log using the row-based format instead of the statement-based format.

([Bug#45855](#), [Bug#45856](#))

- **Replication:** Statements that updated `AUTO_INCREMENT` columns in multiple tables were logged using the row-based format when `--binlog_format` was set to `MIXED`, but did not cause an `UNSAFE STATEMENT` warning to be generated when `--binlog_format` was set to `STATEMENT`. ([Bug#45827](#))

See also [Bug#39934](#).

- **Replication:** Even though `INSERT DELAYED` statements are unsafe for statement-based replication, they caused the statement only to be logged in row format when the binary logging format was `MIXED`, but did not cause a warning to be generated when the binary logging format was `STATEMENT`. ([Bug#45825](#))
- **Replication:** When using `MIXED` binary logging format, statements containing a `LIMIT` clause and occurring in stored routines were not written to the log as row events. ([Bug#45785](#))

- **Replication:** When using statement-based replication, database-level character sets were not always honored by the replication SQL thread. This could cause data inserted on the master using `LOAD DATA` to be replicated using the wrong character set.

Note

This was not an issue when using row-based replication.

([Bug#45516](#))

- **Replication:** `STOP SLAVE` did not flush the relay log or the `master.info` or `relay-log.info` files, which could lead to corruption if the server crashed. ([Bug#44188](#))
- **Replication:** Large transactions and statements could corrupt the binary log if the size of the cache (as set by `max_binlog_cache_size`) was not large enough to store the changes.

Now, for transactions that do not fit into the cache, the statement is not logged, and the statement generates an error instead.

For nontransactional changes that do not fit into the cache, the statement is also not logged—an incident event is logged after committing or rolling back any pending transaction, and the statement then raises an error.

Note

If a failure occurs before the incident event is written the binary log, the slave does not stop, and the master does not report any errors.

([Bug#43929](#))

See also [Bug#37148](#), [Bug#46166](#).

- **Replication:** On Windows, `RESET MASTER` failed in the event of a missing binlog file rather than issuing a warning and completing the rest of the statement. ([Bug#42150](#), [Bug#42218](#))
- **Replication:** Executing the sequence of statements `RESET SLAVE`, `RESET MASTER`, and `FLUSH LOGS`, when binary log or relay log files listed in the index file could not be found, could cause the server to crash. This could happen, for example, when these files had been moved or deleted manually. ([Bug#41902](#))
- **Replication:** MySQL creates binary logs in a numbered sequence, with a maximum possible 4294967295 concurrent log files, 4294967295 being the maximum value for an unsigned long integer. However, binary log file extensions were turned into negative numbers once the variable used to hold the value reached the maximum value for a signed long integer (2147483647). Consequently, when the sequence value was incremented to the next (negative) number, this caused MySQL to try to create the file using a `.000000` extension, causing the server to fail since this file already existed.

Negative file extensions are no longer permitted, and an error is returned when the limit is reached. In addition, `FLUSH LOGS` now also reports warnings to the user, if the extension number has reached the limit, and warnings are printed to the error log when the limit is approaching. ([Bug#40611](#))

- **Replication:** Issuing concurrent `STOP SLAVE`, `START SLAVE`, and `RESET SLAVE` statements using different connections caused the replication slave to crash. ([Bug#38716](#))

See also [Bug#38715](#), [Bug#44312](#).

- **Replication:** A slave compiled using `--with-libevent` and run with `--thread-handling=pool-of-threads` could sometimes crash. ([Bug#36929](#))
- **Replication:** `mysqlbinlog` sometimes failed when trying to create temporary files; this was because it ignored the specified temp file directory and tried to use the system `/tmp` directory instead. ([Bug#35546](#))

See also [Bug#35543](#).

- **Replication:** A `CHANGE MASTER TO` statement with no `MASTER_HEARTBEAT_PERIOD` option failed to reset the heartbeat period to its default value. ([Bug#34686](#))
- **Replication:** As part of the fix for this issue, the `Rpl_recovery_rank` column, which had appeared in the output of `SHOW SLAVE HOSTS` in some MySQL releases, was removed because the corresponding server variable `rpl_recovery_rank` (now deprecated) was never actually used. ([Bug#13963](#))

See also [Bug#21132](#), [Bug#21869](#).

- `mysqld_safe` did not pass the correct default value of `plugin_dir` to `mysqld`. ([Bug#51938](#))
- `mysqld_multi` failed due to a syntax error in the script. ([Bug#51468](#))

- `ALTER TABLE` on a `MERGE` table that has been locked using `LOCK TABLES ... WRITE` incorrectly produced an `ER_TABLE_NOT_LOCKED_FOR_WRITE` error. ([Bug#51240](#))
- The `mysql` could default to the `ascii` character set, which is not a valid character set choice for MySQL. The `latin1` character set will now be used when an ASCII environment has been identified. ([Bug#51166](#))
- On some Unix/Linux platforms, an error during build from source could be produced, referring to a missing `LT_INIT` program. This is due to versions of `libtool` 2.1 and earlier. ([Bug#51009](#))
- Referring to a subquery result in a `HAVING` clause could produce incorrect results. ([Bug#50995](#))
- Aggregate functions on `TIMESTAMP` columns could yield incorrect or undefined results. ([Bug#50888](#))
- Use of `filesort` plus the join cache normally is preferred to a full index scan. But it was used even if the index is clustered, in which case, the clustered index scan can be faster. ([Bug#50843](#))
- For debug builds, `SHOW BINARY LOGS` caused an assertion to be raised if binary logging was not enabled. ([Bug#50780](#))
- The server did not recognize that the stored procedure cache became invalid if a view was created or modified within a procedure, resulting in a crash. ([Bug#50624](#))
- Incorrect handling of `BIT` columns in temporary tables could lead to spurious duplicate-key errors. ([Bug#50591](#))
- The second or subsequent invocation of a stored procedure containing `DROP TRIGGER` could cause a server crash. ([Bug#50423](#))
- The return value for calls to put information into the stored routine cache were not consistently checked, causing an assertion to be raised. ([Bug#50412](#))
- Full-text queries that used the truncation operator (*) could enter an infinite loop. ([Bug#50351](#))
- For debug builds, an assertion was incorrectly raised in the optimizer when matching `ORDER BY` expressions. ([Bug#50335](#))
- Queries optimized with `GROUP_MIN_MAX` did not clean up KEYREAD optimizations properly, causing subsequent queries to return incomplete rows. ([Bug#49902](#))
- `mysql --show-warnings` crashed if the server connection was lost. ([Bug#49646](#))
- For string-valued system variables containing multibyte characters, the byte length was used in contexts where the character length was more appropriate. ([Bug#49645](#))
- `SHOW VARIABLES` did not correctly display string-valued system variables that contained \0 characters. ([Bug#49644](#))
- MySQL program option-processing code incorrectly displayed some options when printing ambiguous-option errors. ([Bug#49640](#))
- For dynamic format `MyISAM` tables containing `LONGTEXT` columns, a bulk `INSERT ... ON DUPLICATE KEY UPDATE` or bulk `REPLACE` could cause corruption. ([Bug#49628](#))
- Setting `binlog_format` to `DEFAULT` assigned a value different from the default. ([Bug#49540](#))
- For debug builds, with `sql_safe_updates` enabled, a multiple-table `UPDATE` with the `IGNORE` modifier could raise an assertion. ([Bug#49534](#))
- `EXPLAIN EXTENDED` crashed trying to print column names for a subquery in the `FROM` clause when the table had gone out of scope. ([Bug#49487](#))
- For `InnoDB` tables, the test for using an index for `ORDER BY` sorting did not distinguish between primary keys and secondary indexes and expected primary key values to be concatenated to index values the way they are to secondary key values. ([Bug#49324](#))
- `mysqltest` no longer lets you execute an SQL statement on a connection after doing a `send` command, unless you do a `reap` first. This was previously accepted but could produce unpredictable results. ([Bug#49269](#))
- Valgrind warnings for several logging messages were corrected. ([Bug#49130](#))
- For debug builds on Windows, warnings about incorrect use of debugging directives were written to the error log. The directives were rewritten to eliminate these messages. ([Bug#49025](#))
- Plugins in a binary release could not be installed into a debug version of the server. ([Bug#49022](#))

- On POSIX systems, calls to `select()` with a file descriptor set larger than `FD_SETSIZE` resulted in unpredictable I/O errors; for example, when a large number of tables required repair. ([Bug#48929](#))
- A dependent subquery containing `COUNT(DISTINCT col_name)` could be evaluated incorrectly. ([Bug#48920](#))
- If a stored function contained a `RETURN` statement with an `ENUM` value in the `ucs2` character set, `SHOW CREATE FUNCTION` and `SELECT DTD_IDENTIFIER FROM INFORMATION_SCHEMA.ROUTINES` returned incorrect values. ([Bug#48766](#))
- An ARZ file missing from the database directory caused the server to crash. ([Bug#48757](#))
- Running `SHOW CREATE TABLE` on a view `v1` that contained a function which accessed another view `v2` could trigger a infinite loop if the view (`v2`) referenced within the function caused a warning to be raised while being opened. ([Bug#48449](#))
- Invalid memory reads could occur following a query that referenced a `MyISAM` table multiple times with a write lock. ([Bug#48438](#))
- For debug builds, creating a view containing a row constructor caused an assertion to be raised. ([Bug#48294](#))
- An aliasing violation in the C API could lead to a crash. ([Bug#48284](#))
- Slow `CALL` statements were not always logged to the slow query log because execution time for multiple-statement stored procedures was assessed incorrectly. ([Bug#47905](#))
- For debug builds, killing a `SELECT` retrieving from a view that was processing a function caused an assertion to be raised. ([Bug#47736](#))
- Failure to open a view with a nonexistent `DEFINER` was improperly handled and the server would crash later attempting to lock the view. ([Bug#47734](#))
- If a prepared statement used both a `MERGE` table and a stored function or trigger, execution sometimes failed with a `NO SUCH TABLE` error. ([Bug#47648](#))
- `CREATE VIEW` raised an assertion if a temporary table existed with the same name as the view. ([Bug#47635](#))
- Renaming a column of an `InnoDB` table caused the server to go out of sync with the `InnoDB` data dictionary. To avoid this issue, renaming a column uses the older technique of copying all the table data rather than updating the table in-place. ([Bug#47621](#))
- If a temporary table was created with the same name as a view referenced in a stored routine, routine execution could raise an assertion. ([Bug#47313](#))
- Selecting from the process list in the embedded server caused a crash. ([Bug#47304](#))

See also [Bug#43733](#).

- Programs did not exit if the option file specified by `--defaults-file` was not found. ([Bug#47216](#))
- Attempts to print octal numbers with `my_vsnprintf()` could cause a crash. ([Bug#47212](#))
- Corrected a potential problem of unintended overwriting of files when the `MY_DONT_OVERWRITE_FILE` flag was used. ([Bug#47126](#))
- Deadlock occurred if one session was running a multiple-statement transaction that involved a single partitioned table and another session attempted to alter the table. ([Bug#46654](#))
- Valgrind warnings about memory allocation overruns for handling `CREATE FUNCTION` statements for UDFs were corrected. ([Bug#46570](#))
- The server could crash attempting to flush privileges after receipt of a `SIGHUP` signal. ([Bug#46495](#))
- If `INSERT INTO tbl_name` invoked a stored function that modified `tbl_name`, the server crashed. ([Bug#46374](#))
- For queries that used `GROUP_CONCAT(DISTINCT ...)`, the value of `max_heap_table_size` was used for memory allocation, which could be excessive. Now the minimum of `max_heap_table_size` and `tmp_table_size` is used. ([Bug#46018](#))
- Improperly closing tables when `INSERT DELAYED` needed to reopen tables could cause an assertion failure. ([Bug#45949](#))

See also [Bug#18484](#).

- Grouping by a subquery in a query with a `DISTINCT` aggregate function led to incorrect and unordered grouping values. ([Bug#45640](#))
- For an IPv6-enabled MySQL server, privileges specified using standard IPv4 addresses for hosts were not matched (only IPv4-mapped addresses were handled correctly).

As part of the fix for this bug, a new build option `--disable-ipv6` has been introduced. Compiling MySQL with this option causes all IPv6-specific code in the server to be ignored.

Important

If the server has been compiled using `--disable-ipv6`, it is not able to resolve hostnames correctly when run in an IPv6 environment. ([Bug#45606](#))

See also [Bug#38247](#), [Bug#43006](#), [Bug#45283](#), [Bug#45584](#).

- The hostname cache failed to work correctly. ([Bug#45584](#))

See also [Bug#38247](#), [Bug#43006](#), [Bug#45283](#), [Bug#45606](#).

- A Windows Installation using the GUI installer would fail with:

```
MySQL Server 5.1 Setup Wizard ended prematurely
The wizard was interrupted before MySQL Server 5.1. could be completely installed.
Your system has not been modified. To complete installation at another time, please run
setup again.

Click Finish to exit the wizard
```

This was due to a step in the MSI installer that could fail to execute correctly on some environments. ([Bug#45418](#))

- Propagation of a large unsigned numeric constant in `WHERE` expressions could lead to incorrect results. This also affected `EXPLAIN EXTENDED`, which printed incorrect numeric constants in such transformed `WHERE` expressions. ([Bug#45360](#))
- There was no timeout for attempts to acquire metadata locks (for example, a `DROP TABLE` attempt for a table that was open in another transaction would not time out).

To handle such situations, there is now a `lock_wait_timeout` system variable that specifies the timeout in seconds for attempts to acquire metadata locks. The permitted values range from 1 to 3153600 (1 year). The default is 3153600.

This timeout applies to all statements that use metadata locks. These include DML and DDL operations on tables, views, stored procedures, and stored functions, as well as `LOCK TABLES`, `FLUSH TABLES WITH READ LOCK`, and `HANDLER` statements.

The timeout value applies separately for each metadata lock attempt. A given statement can require more than one lock, so it is possible for the statement to block for longer than the `lock_wait_timeout` value before reporting a timeout error. When lock timeout occurs, `ER_LOCK_WAIT_TIMEOUT` is reported.

`lock_wait_timeout` does not apply to delayed inserts, which always execute with a timeout of 1 year. This is done to avoid unnecessary timeouts because a session that issues a delayed insert receives no notification of delayed insert timeouts.

In addition, the unused `table_lock_wait_timeout` system variable was removed. ([Bug#45225](#))

- Valgrind warnings about uninitialized variables in optimizer code were corrected. ([Bug#45195](#))
- Killing a delayed-insert thread could cause a server crash. ([Bug#45067](#))
- Execution of `FLUSH TABLES` or `FLUSH TABLES WITH READ LOCK` concurrently with `LOCK TABLES` resulted in deadlock. ([Bug#45066](#))
- The `mysql_real_connect()` C API function only attempted to connect to the first IP address returned for a hostname. This could be a problem if a hostname mapped to multiple IP address and the server was not bound to the first one returned. Now `mysql_real_connect()` attempts to connect to all IPv4 or IPv6 addresses that a domain name maps to. ([Bug#45017](#))

See also [Bug#47757](#).

- For plugins that did not have command-line options other than the ones to select the plugin itself, those options were not displayed in the `mysqld` help message. ([Bug#44797](#))
- Some plugins configured as mandatory could be disabled at server startup. ([Bug#44691](#))

- InnoDB took a shared row lock when executing `SELECT` statements inside a stored function as a part of a transaction using `REPEATABLE READ`. This prevented other transactions from updating the row. ([Bug#44613](#))
- MySQL Server permitted the creation of a merge table based on views but crashed when attempts were made to read from that table. The following example demonstrates this:

```
#Create a test table
CREATE TABLE tmp (id int, c char(2));

#Create two VIEWS upon it
CREATE VIEW v1 AS SELECT * FROM tmp;
CREATE VIEW v2 AS SELECT * FROM tmp;

#Finally create a MERGE table upon the VIEWS
CREATE TABLE merge (id int, c char(2))
ENGINE=MERGE UNION(v1, v2);

#Reading from the merge table lead to a crash
SELECT * FROM merge;
```

The final line of the code generated the crash. ([Bug#44040](#))

- A natural join of `INFORMATION_SCHEMA` tables could cause an assertion failure. ([Bug#43834](#))
- When used in conjunction with `LOCK TABLES, FLUSH TABLE tbl_list` waited for all tables with old versions to clear from the table definition list, rather than only the named tables. ([Bug#43685](#))
- `HANDLER` statements are now not permitted if a table lock has been acquired with `LOCK TABLES`. ([Bug#43272](#))
- In the embedded server, stack overflow checks for recursive stored procedure calls did not work and stack overflow could occur. ([Bug#43201](#))
- The server could crash if an attempt to open a `MERGE` table child `MyISAM` table failed. ([Bug#42862](#))
- Comparison of `TIME` values could lose the sign of operands. ([Bug#42664](#))
- `MAKETIME()` could lose the sign of negative arguments. ([Bug#42662](#))
- `SEC_TO_TIME()` could lose the sign of negative arguments. ([Bug#42661](#))
- Due to work done for [Bug#989](#), `FLUSH TABLES` is not permitted when there is an active `LOCK TABLES ... READ`. This caused a problem with `mysqlhotcopy`, which used that sequence of statements. `mysqlhotcopy` now uses `FLUSH TABLES tbl_list WITH READ LOCK` to flush and lock tables. If `mysqlhotcopy` is used with a server older than MySQL 5.5.3 that does not support this statement, it has a new option `--old_server` that causes it to use the previous statement sequence. ([Bug#42465](#))
- Setting `key_buffer_size` to a negative value could lead to very large allocations. Now an error occurs. ([Bug#42103](#))
- An assertion failure could occur if `OPTIMIZE TABLE` was started on an `InnoDB` table and the table was altered to a different storage engine during the optimization operation. ([Bug#42074](#))
- The state of a thread for the embedded server was always displayed as `Writing to net`, which is incorrect because there is no network connection for the embedded server. ([Bug#41971](#))
- The patch for [Bug#10374](#) broke named-pipe and shared-memory connections on Windows. ([Bug#41860](#))
- Purging the stored routine cache could take a long time and render the server unresponsive. ([Bug#41804](#))
- Command-line options for enumeration-type plugin variables were not honored. ([Bug#41010](#))
- System variables could be set to invalid values. ([Bug#40988](#))
- The `CSV` storage engine did not parse '`\x`' characters when they occurred in unquoted fields. ([Bug#40814](#))
- When archive tables were joined on their primary keys, a query returned no result if the optimizer chose to use this index. ([Bug#40677](#))
- `mysqld_safe` did not treat dashes and underscores as equivalent in option names. Thanks to Erik Ljungstrom for the patch to fix this bug. ([Bug#40368](#))
- `SHOW CREATE VIEW` returned invalid SQL if the definition contained a `SELECT 'string'` statement where the `string` was longer than the maximum length of a column name, due to the fact that this text was also used as an alias (in the `AS` clause).

Because not all names retrieved from arbitrary `SELECT` statements can be used as view column names due to length and format restrictions, the server now checks the conformity of automatically generated column names and rewrites according to a pre-defined format any names that are not acceptable as view column names before storing the final view definition on disk.

In such cases, the name is now rewritten as `Name_exp_pos`, where `pos` is the position of the column. To avoid this conversion scheme, define explicit, valid names for view columns using the `column_list` clause of the `CREATE VIEW` statement.

As part of this fix, aliases are now generated only for top-level statements. ([Bug#40277](#))

- Threads were set to the `Table lock` state in such a way that use of this state by other threads to check for a lock wait was subject to a race condition. ([Bug#39897](#))
- Plugin shutdown could lead to an assertion failure caused by using an already destroyed mutex in the metadata locking subsystem. ([Bug#39674](#))
- Dropping a locked `Maria` table leads to an assertion failure. ([Bug#39395](#))
- Host name lookup failure could lead to a server crash. ([Bug#39153](#))
- `flush_cache_records()` did not correctly check for errors that should cause statement execution to stop, leading to a server crash. ([Bug#39022](#))
- `InnoDB` logged an error repeatedly trying to load a page into the buffer pool, filling the error log and using excessive disk space. Now the number of attempts is limited to 100, after which the operation aborts with a message. ([Bug#38901](#))
- Valgrind warnings that occurred for `SHOW TABLE STATUS` with `InnoDB` tables were silenced. ([Bug#38479](#))
- An IPv6-enabled MySQL server did not resolve the IP addresses of incoming connections correctly, with the result that a connection that attempted to match any privilege table entries using fully-qualified domain names for hostnames or hostnames using wildcards were dropped. ([Bug#38247](#))

See also [Bug#43006](#), [Bug#45283](#), [Bug#45584](#), [Bug#45606](#).

- For `CREATE TABLE ... LIKE` with a `MERGE` source table that included a `UNION` clause, that clause was omitted from the definition of the destination table. ([Bug#37371](#))
- Previously, statements inside a stored program did not clear the warning list. For example, warnings or errors generated by statements within a trigger or stored function would be accumulated and added to the message list for the statement that activated the trigger or invoked the function, “polluting” the output of `SHOW WARNINGS` or `SHOW ERRORS` for the outer statement. Normally, messages for a statement that can generate messages replace messages from the previous such statement. The effect was that a statement could have a different effect on the message list depending on whether it executed inside or outside of a stored program.

Now within a stored program, successive statements that can generate messages update the message list and replace messages from the previous such statement. Only messages from the last of these statements is copied to the message list for the outer statement. ([Bug#36649](#))

- `myisampack --join` did not create the destination table `.frm` file. ([Bug#36573](#))
- The parser incorrectly permitted MySQL error code 0 to be specified for a condition handler. (This is incorrect because the condition must be a failure condition and 0 indicates success.) ([Bug#36510](#))
- When parsing or formatting interval values of `DAY_MICROSECOND` type, fractional seconds were not handled correctly when more-significant fields were implied or omitted. ([Bug#36466](#))
- `mysql_install_db` failed if run as `root` and the root directory `(/)` was not writable. ([Bug#36462](#))
- `mysql_stmt_prepare()` did not reset the list of messages (those messages available using `SHOW WARNINGS`). ([Bug#36004](#))
- A global read lock obtained with `FLUSH TABLES WITH READ LOCK` did not prevent sessions from creating tables. ([Bug#35935](#))
- `mysqldbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqldbinlog` to fail. This caused problems in testing and other situations where `mysqldbinlog` might be invoked many times in a relatively short period of time. ([Bug#35543](#))
- When building MySQL when using a different target directory (for example using the `VPATH` environment variable), the build of the embedded `readline` component would fail. ([Bug#35250](#))

- String-valued system variables could be assigned literal values, but could not be assigned values using expressions. Now expressions are legal. ([Bug#34883](#), [Bug#46314](#))
- The `sql_mode` system variable could be assigned the illegal value of `'?'`. ([Bug#34834](#))
- Some system variables could not be assigned the value `DEFAULT` to assign their default value. ([Bug#34829](#), [Bug#34878](#))
- Compiling MySQL on FreeBSD would fail due to missing definitions for certain network constants. ([Bug#34292](#))
- Creation of a temporary `BLOB` or `TEXT` column could create a column with the wrong maximum length. ([Bug#33969](#))
- `INSERT INTO ... VALUES(DEFAULT)` failed to insert the correct value for `ENUM` columns. For `MyISAM` tables, an empty value was inserted. For `CSV` tables, the table became corrupt. ([Bug#33717](#))
- When `read_only` was enabled, the server incorrectly prevented data modifications to `TEMPORARY` tables belonging to transactional storage engines such as `InnoDB`. ([Bug#33669](#))
- Constant expressions in `WHERE`, `HAVING`, or `ON` clauses were not cached, but were evaluated for each row. This caused a slowdown of query execution, especially if constant user-defined functions or stored functions were used. ([Bug#33546](#))
- Plugins could find the unqualified form of their system variables but not the qualified form. For example, a plugin `p` with a system variable `sv` could find `sv` but not `p_sv`. ([Bug#32902](#))
- Killing a statement that invoked a stored function could return an incorrect error message indicating table corruption rather than that the statement had been interrupted. ([Bug#32140](#))
- Occurrence of an error within a stored routine did not always cause immediate statement termination. ([Bug#31881](#))
- For `DROP FUNCTION db_name.func_name` (that is, when the function name is qualified with the database name), the statement should apply only to a stored function named `func_name` in the given database. However, if a UDF with the same name existed, the statement dropped the UDF instead. ([Bug#31767](#))
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. ([Bug#26788](#))

See also [Bug#12860](#).

- `ALTER TABLE` could not be used to add columns to a table if the table had an index on a `utf8` column with a `TEXT` data type. ([Bug#26180](#))
- If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. ([Bug#26141](#))
- Some system variables displayed by `SHOW VARIABLES` could not be selected using `SELECT @@{GLOBAL,SESSION}.var_name`. ([Bug#25430](#))
- Statements to create, alter, or drop a view were not waiting for completion of statements that were using the view, which led to incorrect sequences of statements in the binary log when statement-based logging was enabled. ([Bug#25144](#))
- Previously, the server handled character data types for a stored routine parameter, local routine variable created with `DECLARE`, or stored function return value as follows: If the `CHARACTER SET` attribute was present, the `COLLATE` attribute was not supported, so the character set's default collation was used. (This includes use of `BINARY`, which in this context specifies the binary collation of the character set.) If there was no `CHARACTER SET` attribute, the database character set and its default collation were used.

Now for character data types, if there is a `CHARACTER SET` attribute in the declaration, the specified character set and its default collation is used. If the `COLLATE` is also present, that collation is used rather than the default collation. If there is no `CHARACTER SET` attribute, the database character set and collation in effect at routine creation time are used. (The database character set and collation are given by the value of the `character_set_database` and `collation_database` system variables.) ([Bug#24690](#))

- `Data truncated for column col_num at row row_num` warnings were generated for some (constant) values that did not have too high precision. ([Bug#24541](#))
- A statement that caused a circular wait among statements did not return a deadlock error. Now the server detects deadlock and returns `ER_LOCK_DEADLOCK`. ([Bug#22876](#))
- `CREATE TABLE ... LIKE` did not always produce an error if the source table column defaults were illegal for the current version of MySQL. (This could occur if the table was created using an older server that was less restrictive about legal default values.) ([Bug#22090](#))

- Several data-modification statements were not being counted toward the `MAX_UPDATES_PER_HOUR` user resource limit. ([Bug#21793](#))
- When inserting an extraordinarily large value into a `DOUBLE` column, the value could be truncated in such a way that the new value cannot be reloaded manually or from the output of `mysqldump`. ([Bug#21497](#))
- The value of `sql_slave_skip_counter` was empty when displayed by `SHOW VARIABLES` or `INFORMATION_SCHEMA.GLOBAL_VARIABLES`. ([Bug#20413](#), [Bug#37187](#))
- For `INSERT DELAYED` statements issued for a table while an `ALTER TABLE` operation on the table was in progress, the server could return a spurious `Server shutdown in progress` error. ([Bug#18484](#))

See also [Bug#45949](#).

- Delayed-insert threads were counted as connected but not as created, incorrectly leading to a `Threads_connected` value greater than the `Threads_created` value. ([Bug#17954](#))
- The character set was not being properly initialized for `CAST()` with a type such as `CHAR(2) BINARY`, which resulted in incorrect results or a server crash. ([Bug#17903](#))
- Stored procedure exception handlers were catching fatal errors (such as out of memory errors), which could cause execution not to stop due to a continue handler. Now fatal errors are not caught by exception handlers and a fatal error is returned to the client. ([Bug#15192](#))
- Zero-padding of exponent values was not the same across platforms. ([Bug#12860](#))
- For `CREATE TABLE`, the parser did not enforce that parentheses were present in a `CHECK (expr)` clause; now it does. The parser did not enforce that `CONSTRAINT [symbol]` without a following `CHECK` clause was illegal; now it does. ([Bug#11714](#), [Bug#35578](#), [Bug#38696](#))
- If a connection was waiting for a `GET_LOCK()` lock or a `SLEEP()` call, and the connection aborted, the server did not detect this and thus did not close the connection. This caused a waste of system resources allocated to dead connections. Now the server checks such a connection every five seconds to see whether it has been aborted. If so, the connection is killed (and any lock request is aborted). ([Bug#10374](#))
- `perror` did not work for errors described in the `sql/share/errmsg.txt` file. ([Bug#10143](#))
- The grammar for `GROUP BY`, when used with `WITH CUBE` or `WITH ROLLUP`, caused a conflict with the grammar for view definitions that included `WITH CHECK OPTION`. ([Bug#9801](#))
- For the `DIV` operator, incorrect results could occur for noninteger operands that exceed `BIGINT` range. Now, if either operand has a noninteger type, the operands are converted to `DECIMAL` and divided using `DECIMAL` arithmetic before converting the result to `BIGINT`. If the result exceeds `BIGINT` range, an error occurs. ([Bug#8457](#))
- Labels in stored routines did not work if the character set was not `latin1`. ([Bug#7088](#))
- Previously, for some Asian CJK character sets, the `UPPER()` and `LOWER()` functions worked only for basic Latin letters (`A-Z, a-z`). The affected character sets are `ujis`, `sjis`, `gb2312`, `cp932`, `eucjpm`, `big5`, `euckr`, and `gbk`.

Now `UPPER()` and `LOWER()` perform case conversion correctly for all characters in these character sets, with the exception that if a character set contains a character in only one lettercase, conversion to the other lettercase cannot be done.

D.1.9. Changes in MySQL 5.5.2 (12 February 2010)

InnoDB Notes:

- This release includes InnoDB 1.0.6. This version is considered of Release Candidate (RC) quality.

Functionality added or changed:

- **Replication:** Introduced the `binlog_direct_non_transactional_updates` system variable. Enabling this variable causes updates using the statement-based logging format to tables using nontransactional engines to be written directly to the binary log, rather than to the transaction cache.

Before enabling this variable, be certain that you have no dependencies between transactional and nontransactional tables. A statement that both selects from an InnoDB table and inserts into a MyISAM table is an example of such a dependency. For more information, see [Section 17.1.3.4, “Binary Log Options and Variables”](#). ([Bug#46364](#))

See also [Bug#28976](#), [Bug#40116](#).

Bugs fixed:

- **Performance: Partitioning:** When used on partitioned tables, the `records_in_range` handler call checked more partitions than necessary. The fix for this issue reduces the number of unpruned partitions checked for statistics in partition range checking, which has resulted in some partition operations being performed up to 2-10 times faster than before this change was made, when testing with tables having 1024 partitions. ([Bug#48846](#))

See also [Bug#37252](#), [Bug#47261](#).

- **Performance:** The method for comparing `INFORMATION_SCHEMA` names and database names was nonoptimal and an improvement was made: When the database name length is already known, a length check is made first and content comparison skipped if the lengths are unequal. ([Bug#49501](#))
- **Performance:** The `MD5()` and `SHA1()` functions had excessive overhead for short strings. ([Bug#49491](#))
- **Security Fix:** For servers built with yaSSL, a preauthorization buffer overflow could cause memory corruption or a server crash. We thank Evgeny Legerov from Intevydis for providing us with a proof-of-concept script that permitted us to reproduce this bug. ([Bug#50227](#), [CVE-2009-4484](#))
- **Incompatible Change:** In `plugin.h`, the `MYSQL_REPLICATION_PLUGIN` symbol was out of synchrony with its value in MySQL 6.0 because the lower-valued `MYSQL_AUDIT_PLUGIN` was not present. To correct this, `MYSQL_AUDIT_PLUGIN` has been added in MySQL 5.5, changing the value of `MYSQL_REPLICATION_PLUGIN` from 5 to 6. Attempts to load the audit plugin produce an error occurs because only the `MYSQL_AUDIT_PLUGIN` symbol was added, not the audit plugin itself. This error will go away when the audit plugin is added to MySQL 5.5 (in 5.5.3). Replication plugins from earlier 5.5.x releases must be recompiled against the current release before they will work with the current release. ([Bug#49894](#))
- **Important Change: Replication:** The `RAND()` function is now marked as unsafe for statement-based replication. Using this function now generates a warning when `binlog_format=STATEMENT` and causes the format to switch to row-based logging when `binlog_format=MIXED`.

This change is being introduced because, when `RAND()` was logged in statement mode, the seed was also written to the binary log, so the replication slave generated the same sequence of random numbers as was generated on the master. While this could make replication work in some cases, the order of affected rows was still not guaranteed when this function was used in statements that could update multiple rows, such as `UPDATE` or `INSERT ... SELECT`; if the master and the slave retrieved rows in different order, they began to diverge. ([Bug#49222](#))

- **Partitioning: InnoDB Storage Engine:** When an `ALTER TABLE ... REORGANIZE PARTITION` statement on an `InnoDB` table failed due to `innodb_lock_wait_timeout` expiring while waiting for a lock, `InnoDB` did not clean up any temporary files or tables which it had created. Attempting to reissue the `ALTER TABLE` statement following the timeout could lead to storage engine errors, or possibly a crash of the server. ([Bug#47343](#))
- **InnoDB Storage Engine:** Creating or dropping a table with 1023 transactions active caused an assertion failure. ([Bug#49238](#))
- **InnoDB Storage Engine:** If `innodb_force_recovery` was set to 4 or higher, the server could crash when opening an `InnoDB` table containing an auto-increment column. MySQL versions 5.1.31 and later were affected. ([Bug#46193](#))
- **Replication:** `FLUSH LOGS` could in some circumstances crash the server. This occurred because the I/O thread could concurrently access the relay log I/O cache while another thread was performing the `FLUSH LOGS`, which closes and reopens the relay log and, while doing so, initializes (or re-initializes) its I/O cache. This could cause problems if some other thread (in this case, the I/O thread) is accessing it at the same time.

Now the thread performing the `FLUSH LOGS` takes a lock on the relay log before actually flushing it. ([Bug#50364](#))

See also [Bug#53657](#).

- **Replication:** With semisynchronous replication, memory allocated for handling transactions could be freed while still in use, resulting in a server crash. ([Bug#50157](#))
- **Replication:** In some cases, inserting into a table with many columns could cause the binary log to become corrupted. ([Bug#50018](#))

See also [Bug#42749](#).

- **Replication:** When using row-based replication, setting a `BIT` or `CHAR` column of a `MyISAM` table to `NULL`, then trying to delete from the table, caused the slave to fail with the error `CAN'T FIND RECORD IN TABLE`. ([Bug#49481](#), [Bug#49482](#))

- **Replication:** A `LOAD DATA INFILE` statement that loaded data into a table having a column name that had to be escaped (such as ``key` INT`) caused replication to fail when logging in mixed or statement mode. In such cases, the master wrote the `LOAD DATA` event into the binary log without escaping the column names. ([Bug#49479](#))

See also [Bug#47927](#).

- **Replication:** When logging in row-based mode, DDL statements are actually logged as statements; however, statements that affected temporary tables and followed DDL statements failed to reset the binary log format to `ROW`, with the result that these statements were logged using the statement-based format. Now the state of `binlog_format` is restored after a DDL statement has been written to the binary log. ([Bug#49132](#))
- **Replication:** Spatial data types caused row-based replication to crash. ([Bug#48776](#))
- **Replication:** When using row-based logging, the statement `CREATE TABLE t IF NOT EXIST ... SELECT` was logged as `CREATE TEMPORARY TABLE t IF NOT EXIST ... SELECT` when `t` already existed as a temporary table. This was caused by the fact that the temporary table was opened and the results of the `SELECT` were inserted into it when a temporary table existed and had the same name.

Now, when this statement is executed, `t` is created as a base table, the results of the `SELECT` are inserted into it—even if there already exists a temporary table having the same name—and the statement is logged correctly. ([Bug#47418](#))

See also [Bug#47442](#).

- **Replication:** Due to a change in the size of event representations in the binary log, when replicating from a MySQL 4.1 master to a slave running MySQL 5.0.60 or later, the `START SLAVE UNTIL` statement did not function correctly, stopping at the wrong position in the log. Now the slave detects that the master is using the older version of the binary log format, and corrects for the difference in event size, so that the slave stops in the correct position. ([Bug#47142](#))
- **Replication:** Manually removing entries from the binary log index file on a replication master could cause the server to repeatedly send the same binary log file to slaves. ([Bug#28421](#))
- The SSL certificates in the test suite were about to expire. They have been updated with expiration dates in the year 2015. ([Bug#50642](#))
- `SPATIAL` indexes were permitted on columns with non-spatial data types, resulting in a server crash for subsequent table inserts. ([Bug#50574](#))
- Index prefixes could be specified with a length greater than the associated column, resulting in a server crash for subsequent table inserts. ([Bug#50542](#))
- Use of loose index scan optimization for an aggregate function with `DISTINCT` (for example, `COUNT(DISTINCT)`) could produce incorrect results. ([Bug#50539](#))
- The `printstack` function does not exist on Solaris 8 or earlier, which would lead to a compilation failure. ([Bug#50409](#))
- A user could see tables in `INFORMATION_SCHEMA.TABLES` without appropriate privileges for them. ([Bug#50276](#))
- Debug output for join structures was garbled. ([Bug#50271](#))
- The server crashed when an `InnoDB` background thread attempted to write a message containing a partitioned table name to the error log. ([Bug#50201](#))
- Within a stored routine, selecting the result of `CONCAT_WS()` with a routine parameter argument into a user variable could return incorrect results. ([Bug#50096](#))
- The `filesort` sorting method applied to a `CHAR(0)` column could lead to a server crash. ([Bug#49897](#))
- `EXPLAIN EXTENDED UNION ... ORDER BY` caused a crash when the `ORDER BY` referred to a nonconstant or full-text function or a subquery. ([Bug#49734](#))
- Some prepared statements could raise an assertion when re-executed. ([Bug#49570](#))
- `sql_buffer_result` had an effect on non-`SELECT` statements, contrary to the documentation. ([Bug#49552](#))
- In some cases a subquery need not be evaluated because it returns only aggregate values that can be calculated from table metadata. This sometimes was not handled by the enclosing subquery, resulting in a server crash. ([Bug#49512](#))
- Mixing full-text searches and row expressions caused a crash. ([Bug#49445](#))
- `mysql-test-run.pl` now recognizes the `MTR_TESTCASE_TIMEOUT`, `MTR_SUITE_TIMEOUT`, `MTR_SHUTDOWN_TIMEOUT`, and `MTR_START_TIMEOUT` environment variables. If they are set, their values are used to set

the `-- testcase-timeout`, `-- suite-timeout`, `-- shutdown-timeout`, and `-- start-timeout` options, respectively. ([Bug#49210](#))

- Several `strmake()` calls had an incorrect length argument (too large by one). ([Bug#48983](#))
- On Fedora 12, `strmov()` did not guarantee correct operation for overlapping source and destination buffer. Calls were fixed to use an overlap-safe version instead. ([Bug#48866](#))
- With one thread waiting for a lock on a table, if another thread dropped the table and created a new table with the same name and structure, the first thread would not notice that the table had been re-created and would try to use cached metadata that belonged to the old table but had been freed. ([Bug#48157](#))
- If an invocation of a stored procedure failed in the table-open stage, subsequent invocations that did not fail in that stage could cause a crash. ([Bug#47649](#))
- A crash occurred when a user variable that was assigned to a subquery result was used as a result field in a `SELECT` statement with aggregate functions. ([Bug#47371](#))
- When the `mysql` client was invoked with the `--vertical` option, it ignored the `--skip-column-names` option. ([Bug#47147](#))
- The optimizer could continue to execute a query after a storage engine reported an error, leading to a server crash. ([Bug#46175](#))
- If `EXPLAIN` encountered an error in the query, a memory leak occurred. ([Bug#45989](#))
- A race condition on the privilege hash tables permitted one thread to try to delete elements that had already been deleted by another thread. A consequence was that `SET PASSWORD` or `FLUSH PRIVILEGES` could cause a crash. ([Bug#35589](#), [Bug#35591](#))
- 1) In rare cases, if a thread was interrupted during a `FLUSH PRIVILEGES` operation, a debug assertion occurred later due to improper diagnostics area setup. 2) A `KILL` operation could cause a console error message referring to a diagnostic area state without first ensuring that the state existed. ([Bug#33982](#))
- `ALTER TABLE` with both `DROP COLUMN` and `ADD COLUMN` clauses could crash or lock up the server. ([Bug#31145](#))
- The `Table_locks_waited` waited variable was not incremented in the cases that a lock had to be waited for but the waiting thread was killed or the request was aborted. ([Bug#30331](#))

D.1.10. Changes in MySQL 5.5.1 (04 January 2010)

When the publishing process for MySQL 5.5.1-m2 was already running, the MySQL team was informed about a security problem in the SSL connect area (a possibility to crash the server). The problem is caused by a buffer overflow in the yaSSL library. MySQL Servers using OpenSSL are not affected; it can only occur when SSL (using yaSSL) is enabled.

This problem is still under detailed investigation with the various versions, configurations, and platforms. When that has finished, the problem will be fixed as soon as possible, and new binaries for the affected versions will be released. However, building and testing these binaries in the various configurations on the various platforms will take some time.

The bug is tracked with CVE ID [CVE-2009-4484](#). We repeat the general security hint: If it is not *absolutely* necessary that external machines can connect to your database instance, we recommend that the server's connection port be blocked by a firewall to prevent any such illegitimate accesses.

InnoDB Notes:

- InnoDB has been upgraded to version 1.0.6. This version is considered of Release Candidate (RC) quality. [Section 13.7.12](#), “InnoDB Storage Engine Change History”, may contain information in addition to those changes reported here.

RPM Notes:

- The version information in RPM package files has been changed:
 - The “level” field of a MySQL version number is now also included in the RPM version and in the package file name.
 - The RPM “release” value now starts to count from 1, not 0.

For example, the generic x86 server RPM file of 5.5.1-m2 is named `MySQL-server-5.5.1_m2-1_glibc23.i386.rpm`. This improves consistency with other formats that also include the level (for this

version: “m2”) in the file name. For example, the `tar.gz` filename is `mysql-5.5.1-m2-linux-i686-glibc23.tar.gz`. The different separator, underscore ‘`_`’ for RPM, is required by the syntax of RPM.

Functionality added or changed:

- **Partitioning:** The `UNIX_TIMESTAMP()` function is now supported in partitioning expressions using `TIMESTAMP` columns. For example, it is now possible to create a partitioned table such as this one:

```
CREATE TABLE t (c TIMESTAMP)
PARTITION BY RANGE ( UNIX_TIMESTAMP(c) ) (
    PARTITION p0 VALUES LESS THAN (631148400),
    PARTITION p1 VALUES LESS THAN (946681200),
    PARTITION p2 VALUES LESS THAN (MAXVALUE)
);
```

All other expressions involving `TIMESTAMP` values are now rejected with an error when attempting to create a new partitioned table or to alter an existing partitioned table.

When accessing an existing partitioned table having a timezone-dependent partitioning function (where the table was using a previous version of MySQL), a warning rather than an error is issued. In such cases, you should fix the table. One way of doing this is to alter the table’s partitioning expression so that it uses `UNIX_TIMESTAMP()`. ([Bug#42849](#))

Bugs fixed:

- **Performance:** When the query cache is fragmented, the size of the free block lists in the memory bins grows, which causes query cache invalidation to become slow. There is now a 50ms timeout for a `SELECT` statement waiting for the query cache lock. If the timeout expires, the statement executes without using the query cache. ([Bug#39253](#))

See also [Bug#21074](#).

- **Incompatible Change: Replication:** The file names for the semisynchronous plugins were prefixed with `lib`, unlike file names for other plugins. The file names no longer have a `lib` prefix.

This change introduces an incompatibility if the plugins had been installed using the previous names. To handle this, uninstall the older version before installing the newer version. For example, use these statements for the master side plugins on Unix:

```
mysql> UNINSTALL PLUGIN rpl_semi_sync_master;
mysql> INSTALL PLUGIN rpl_semi_sync_master SONAME 'semisync_master.so';
```

If you do not uninstall the older version first, attempting to install the newer version results in an error:

```
mysql> INSTALL PLUGIN rpl_semi_sync_master SONAME 'semisync_master.so';
ERROR 1125 (HY000): Function 'rpl_semi_sync_master' already exists
```

For the slave side, similar statements apply:

```
mysql> UNINSTALL PLUGIN rpl_semi_sync_slave;
mysql> INSTALL PLUGIN rpl_semi_sync_slave SONAME 'semisync_slave.so';
```

- **Important Change: Replication:** The following functions have been marked unsafe for statement-based replication:

- `GET_LOCK()`
- `IS_FREE_LOCK()`
- `IS_USED_LOCK()`
- `MASTER_POS_WAIT()`
- `RELEASE_LOCK()`
- `SLEEP()`
- `SYSDATE()`
- `VERSION()`

None of the functions just listed are guaranteed to replicate correctly when using the statement-based format, because they can produce different results on the master and the slave. The use of any of these functions while `binlog_format` is set to `STATEMENT` is logged with the warning, `STATEMENT IS NOT SAFE TO LOG IN STATEMENT FORMAT`. When `binlog_format` is set to `MIXED`, the binary logging format is automatically switched to the row-based format whenever one of these functions is used. ([Bug#47995](#))

- **Important Change:** After a binary upgrade to MySQL 5.1 from a MySQL 5.0 installation that contains `ARCHIVE` tables:
 - Before MySQL 5.1.42, accessing those tables will cause the server to crash, even if you have run `mysql_upgrade` or `CHECK TABLE ... FOR UPGRADE`.
 - As of MySQL 5.1.42, the server will not open 5.0 `ARCHIVE` tables at all.

In either case, the solution is to use `mysqldump` to dump all 5.0 `ARCHIVE` tables before upgrading, and reload them into MySQL 5.1 after upgrading. The same problem occurs for binary downgrades from MySQL 5.1 to 5.0. ([Bug#47012](#))

- **InnoDB Storage Engine:** When compiling on Windows, an error in the `CMake` definitions for `InnoDB` would cause the engine to be built incorrectly. ([Bug#49502](#))
- **Partitioning:** When `SHOW CREATE TABLE` was invoked for a table that had been created using the `COLUMNS` keyword or the `TO_SECONDS()` function, the output contained the wrong MySQL version number in the conditional comments. ([Bug#49591](#))
- **Partitioning:** A query that searched on a `ucs2` column failed if the table was partitioned. ([Bug#48737](#))
- **Partitioning:** In some cases, it was not possible to add a new column to a table that had subpartitions. ([Bug#48276](#))
- **Partitioning:** `SELECT COUNT(*)` from a partitioned table failed when using the `ONLY_FULL_GROUP_BY` SQL mode. ([Bug#46923](#))

This regression was introduced by [Bug#45807](#).

- **Partitioning:** `SUBPARTITION BY KEY` failed with `DEFAULT CHARSET=utf8`. ([Bug#45904](#))
- **Replication:** When using row-based logging, `TRUNCATE TABLE` was written to the binary log even if the affected table was temporary, causing replication to fail. ([Bug#48350](#))
- **Replication:** A flaw in the implementation of the purging of binary logs could result in orphaned files being left behind in the following circumstances:
 - If the server failed or was killed while purging binary logs.
If the server failed or was killed after creating of a new binary log when the new log file was opened for the first time.
In addition, if the slave was not connected during the purge operation, it was possible for a log file that was in use to be removed; this could lead data loss and possible inconsistencies between the master and slave. ([Bug#45292](#))
- **Replication:** When using the `STATEMENT` or `MIXED` logging format, the statements `LOAD DATA CONCURRENT LOCAL INFILE` and `LOAD DATA CONCURRENT INFILE` were logged as `LOAD DATA LOCAL INFILE` and `LOAD DATA LOCAL INFILE`, respectively (in other words, the `CONCURRENT` keyword was omitted). As a result, when using replication with either of these logging modes, queries on the slaves were blocked by the replication SQL thread while trying to execute the affected statements. ([Bug#34628](#))
- **Cluster Replication:** When `expire_logs_days` was set, the thread performing the purge of the log files could deadlock, causing all binary log operations to stop. ([Bug#49536](#))
- For debug builds on Windows, `SAFE_MALLOC` was defined inconsistently, leading to mismatches when using `my_malloc()` and `my_free()`. ([Bug#49811](#))
- The `mysql.server` script had incorrect shutdown logic. ([Bug#49772](#))
- The `push_warning_printf()` function was being called with an invalid error level `MYSQL_ERROR::WARN_LEVEL_ERROR`, causing an assertion failure. To fix the problem, `MYSQL_ERROR::WARN_LEVEL_ERROR` has been replaced by `MYSQL_ERROR::WARN_LEVEL_WARN`. ([Bug#49638](#))
- The result of comparison between nullable `BIGINT` and `INT` columns was inconsistent. ([Bug#49517](#))
- A Valgrind error in `make_cond_for_table_from_pred()` was corrected. Thanks to Sergey Petrunya for the patch to fix this bug. ([Bug#49506](#))

- Incorrect cache initialization prevented storage of converted constant values and could produce incorrect comparison results. ([Bug#49489](#))
- Comparisons involving `YEAR` values could produce incorrect results. ([Bug#49480](#))
See also [Bug#43668](#).
- Valgrind warnings for `CHECKSUM TABLE` were corrected. ([Bug#49465](#))
- Specifying an index algorithm (such as `BTREE`) for `SPATIAL` or `FULLTEXT` indexes caused a server crash. These index types do not support algorithm specification, and it is not longer permitted to do so. ([Bug#49250](#))
- The optimizer sometimes incorrectly handled conditions of the form `WHERE col_name='const1' AND col_name='const2'`. ([Bug#49199](#))
- Execution of `DECODE()` and `ENCODE()` could be inefficient because multiple executions within a single statement reinitialized the random generator multiple times even with constant parameters. ([Bug#49141](#))
- With binary logging enabled, `REVOKE ... ON {PROCEDURE|FUNCTION} FROM ...` could cause a crash. ([Bug#49119](#))
- The `LIKE` operator did not work correctly when using an index for a `ucs2` column. ([Bug#49028](#))
- `check_key_in_view()` was missing a `DBUG_RETURN` in one code branch, causing a crash in debug builds. ([Bug#48995](#))
- If a query involving a table was terminated with `KILL`, a subsequent `SHOW CREATE TABLE` for that table caused a server crash. ([Bug#48985](#))
- Privileges for stored routines were ignored for mixed-case routine names. ([Bug#48872](#))
See also [Bug#41049](#).
- Building MySQL on Fedora Core 12 64-bit failed, due to errors in `comp_err`. ([Bug#48864](#))
- Concurrent `ALTER TABLE` operations on an `InnoDB` table could raise an assertion. ([Bug#48782](#))
- Incomplete reset of internal `TABLE` structures could cause a crash with `eq_ref` table access in subqueries. ([Bug#48709](#))
- During query execution, ranges could be merged incorrectly for `OR` operations and return an incorrect result. ([Bug#48665](#))
- The `InnoDB` Table Monitor reported the `FLOAT` and `DOUBLE` data types incorrectly. ([Bug#48526](#))
- Re-execution of a prepared statement could cause a server crash. ([Bug#48508](#))
- With row-based binary logging, the server crashed for statements of the form `CREATE TABLE IF NOT EXISTS existing_view LIKE temporary_table`. This occurred because the server handled the existing view as a table when logging the statement. ([Bug#48506](#))
- The error message for `ER_UPDATE_INFO` was subject to buffer overflow or truncation. ([Bug#48500](#))
- `DISTINCT` was ignored for queries with `GROUP BY WITH ROLLUP` and only `const` tables. ([Bug#48475](#))
- Loose index scan was inappropriately chosen for some `WHERE` conditions. ([Bug#48472](#))
- The server could crash and corrupt the tablespace if the `InnoDB` tablespace was configured with too small a value, or if many `CREATE TEMPORARY TABLE` statements were executed and the temporary file directory filled up with `innodb_file_per_table` enabled. ([Bug#48469](#))
- Parts of the range optimizer could be initialized incorrectly, resulting in Valgrind errors. ([Bug#48459](#))
- A bad typecast could cause query execution to allocate large amounts of memory. ([Bug#48458](#))
- `SHOW BINLOG EVENTS` could fail with a error: `Wrong offset or I/O error.` ([Bug#48357](#))
- Valgrind warnings related to binary logging of `LOAD DATA INFILE` statements were corrected. ([Bug#48340](#))
- On Windows, `InnoDB` could not be built as a statically linked library. ([Bug#48317](#))
- `mysql_secure_installation` did not work on Solaris. ([Bug#48086](#))
- When running `mysql_secure_installation`, the command would fail if the root password contained multiple spaces, \, # or quote characters. ([Bug#48031](#))

- `MATCH IN BOOLEAN MODE` searches could return too many results inside a subquery. ([Bug#47930](#))
 - User-defined collations with an ID less than 256 were not initialized correctly when loaded and caused a server crash. ([Bug#47756](#))
 - If a session held a global read lock acquired with `FLUSH TABLES WITH READ LOCK`, a lock for one table acquired with `LOCK TABLES`, and issued an `INSERT DELAYED` statement for another table, deadlock could occur. ([Bug#47682](#))
 - The `mysql` client `status` command displayed an incorrect value for the server character set. ([Bug#47671](#))
 - Connecting to a 4.1.x server from a 5.1.x or higher `mysql` client resulted in a memory-free error when disconnecting. ([Bug#47655](#))
 - Queries containing `GROUP BY ... WITH ROLLUP` that did not use indexes could return incorrect results. ([Bug#47650](#))
 - Assignment of a system variable sharing the same base name as a declared stored program variable in the same context could lead to a crash. ([Bug#47627](#))
 - On Solaris, no stack trace was printed to the error log after a crash. ([Bug#47391](#))
 - The first execution of `STOP SLAVE UNTIL` stopped too early. ([Bug#47210](#))
 - The `innodb_file_format_check` system variable could not be set at runtime to `DEFAULT` or to the value of a user-defined variable. ([Bug#47167](#))
 - The `IGNORE` clause on a `DELETE` statement masked an SQL statement error that occurred during trigger processing. ([Bug#46425](#))
 - Valgrind errors for `InnoDB` were corrected. ([Bug#45992](#), [Bug#46656](#))
 - The return value was not checked for some `my_hash_insert()` calls. ([Bug#45613](#))
 - It was possible for `init_availableCharsets()` not to initialize correctly. ([Bug#45058](#))
 - `GROUP BY` on a `constant` (single-row) `InnoDB` table joined to other tables caused a server crash. ([Bug#44886](#))
 - For a `VARCHAR(N)` column, `ORDER BY BINARY(col_name)` sorted using only the first `N` bytes of the column, even though column values could be longer than `N` bytes if they contained multibyte characters. ([Bug#44131](#))
 - For `YEAR(2)` values, `MIN()`, `MAX()`, and comparisons could yield incorrect results. ([Bug#43668](#))
 - Comparison with `NULL` values sometimes did not produce a correct result. ([Bug#42760](#))
 - In debug builds, killing a `LOAD XML INFILE` statement raised an assertion.
- Implemented in the course of fixing this bug, `mysqlttest` has a new `send_eval` command that combines the functionality of the existing `send` and `eval` commands. ([Bug#42520](#))
- The server could crash when attempting to access a non-conformant `mysql.proc` system table. For example, the server could crash when invoking stored procedure-related statements after an upgrade from MySQL 5.0 to 5.1 without running `mysql_upgrade`. ([Bug#41726](#))
 - The `mysql_upgrade` command would create three additional fields to the `mysql.proc` table (`character_set_client`, `collation_connection`, and `db_collation`), but did not populate the fields with correct values. This would lead to error messages reported during stored procedure execution. ([Bug#41569](#))
 - Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. ([Bug#38883](#))
 - When compressed `MyISAM` files were opened, they were always memory mapped, sometimes causing memory-swapping problems. To deal with this, a new system variable, `myisam_mmap_size`, was added to limit the amount of memory used for memory mapping of `MyISAM` files. ([Bug#37408](#))
 - When running `mysql_secure_installation` on Windows, the command would fail to load a required module, `Term::ReadKey`, which was required for correct operation. ([Bug#35106](#))
 - If the `--log-bin` server option was set to a directory name with a trailing component separator character, the basename of the binary log files was empty so that the created files were named `.000001` and `.index`. The same thing occurred with the `--log-bin-index`, `--relay-log`, and `--relay-log-index` options. Now the server reports an error and exits. ([Bug#34739](#))

- If a comparison involved a constant value that required type conversion, the converted value might not be cached, resulting in repeated conversion and poorer performance. ([Bug#34384](#))
- Using the `SHOW ENGINE INNODB STATUS` statement when using partitions in `InnoDB` tables caused `Invalid (old?) table or database name` errors to be logged. ([Bug#32430](#))
- Output from `mysql --html` did not encode the `<`, `>`, or `&` characters. ([Bug#27884](#))
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). ([Bug#21074](#))

See also [Bug#39253](#).

- On some Windows systems, `InnoDB` could report `Operating system error number 995 in a file operation` due to transient driver or hardware problems. `InnoDB` now retries the operation and adds `Retry attempt is made` to the error message. ([Bug#3139](#))

D.1.11. Changes in MySQL 5.5.0 (07 December 2009 Milestone 2)

Previously, MySQL development proceeded by including a large set of features and moving them over many versions within a release series through several stages of maturity (Alpha, Beta, and so forth). This development model had a disadvantage in that problems with only part of the code could hinder timely release of the whole. As you might have found when testing MySQL Server 6.0, alpha quality code could jeopardize the stability of the entire release. (One consequence of this was that MySQL Server 6.0 has been withdrawn for now.)

MySQL development now uses a milestone model. The move to this model provides for more frequent milestone releases, with each milestone proceeding through a small number of releases having a focus on a specific subset of thoroughly tested features. Following the releases for one milestone, development proceeds with the next milestone; that is, another small number of releases that focuses on the next small set of features, also thoroughly tested.

MySQL 5.5.0-m2 is the first release for Milestone 2. The new features of this milestone may be considered to be initially of beta quality. For subsequent Milestone 2 releases, we plan to use increasing version numbers (5.5.1 and higher) while continuing to employ the “-m2” suffix. For Milestone 3, we plan to change the suffix to “-m3”. Version designators with “-alpha” or “-beta” suffixes are no used.

You may notice that the MySQL 5.5.0 release is designated as Milestone 2 rather than Milestone 1. This is because MySQL 5.4 was actually designated as Milestone 1, although we had not yet begun referring to milestone numbers as part of version numbers at the time.

InnoDB Notes:

- The `InnoDB Plugin` is included in MySQL 5.5 releases as the built-in version of `InnoDB`. The version of the `InnoDB` in this release is 1.0.5 and is considered of Release Candidate (RC) quality.

This version of `InnoDB` offers new features, improved performance and scalability, enhanced reliability and new capabilities for flexibility and ease of use. Among the features are “Fast index creation,” table and index compression, file format management, new `INFORMATION_SCHEMA` tables, capacity tuning, multiple background I/O threads, and group commit.

For information about these features, see [InnoDB Plugin 1.0 for MySQL 5.1 User’s Guide](#). For general information about using `InnoDB` in MySQL, see [Section 13.6, “The InnoDB Storage Engine”](#).

In this version of `InnoDB`, the `innodb_file_io_threads` system variable has been removed and replaced with `innodb_read_io_threads` and `innodb_write_io_threads`. If you upgrade from MySQL 5.1 to MySQL 5.5 and previously explicitly set `innodb_file_io_threads` at server startup, you must change your configuration. Either remove any reference to `innodb_file_io_threads` or replace it with references to `innodb_read_io_threads` and `innodb_write_io_threads`.

Functionality added or changed:

- **Incompatible Change:** MySQL Server now includes a plugin services interface that complements the plugin API. The services interface enables server functionality to be exposed as a “service” that plugins can access through a function-call interface. The `libmysqlservices` library provides access to the available services and dynamic plugins now must be linked against this library (use the `-lmysqlservices` flag). For an example showing what `Makefile.am` should look like, see [Section 23.2.6, “MySQL Services for Plugins”](#). ([Bug#48461](#))
- **Incompatible Change:** Several changes have been made regarding the language and character set of error messages:

- The `--language` option for specifying the directory for the error message file is now deprecated. The new `--lc-messages-dir` and `--lc-messages` options should be used instead, and `--language` is handled as an alias for `--lc-messages-dir`.
- The `language` system variable has been removed and replaced with the new `lc_messages_dir` and `lc_messages` system variables. `lc_messages_dir` has only a global value and is read only. `lc_messages` has global and session values and can be modified at runtime, so the error message language can be changed while the server is running, and individual clients each can have a different error message language by changing their session `lc_messages` value to a different locale name.
- Error messages previously were constructed in a mix of character sets. This issue is resolved by constructing error messages internally within the server using UTF-8 and returning them to the client in the character set specified by the `character_set_results` system variable. The content of error messages therefore may in some cases differ from the messages returned previously.

For more information, see [Section 9.2, “Setting the Error Message Language”](#), and [Section 9.1.6, “Character Set for Error Messages”](#).

See also [Bug#46218](#), [Bug#46236](#).

- **Partitioning:** New `PARTITION BY RANGE COLUMNS(column_list)` and `PARTITION BY LIST COLUMNS(column_list)` options are added for the `CREATE TABLE` and `ALTER TABLE` statements.

A major benefit of `RANGE COLUMNS` and `LIST COLUMNS` partitioning is that they make it possible to define ranges or lists based on column values that use string, date, or datetime values.

These new extensions also broaden the scope of partition pruning to provide better coverage for queries using comparisons on multiple columns in the `WHERE` clause, some examples being `WHERE a = 1 AND b < 10` and `WHERE a = 1 AND b = 10 AND c < 10`.

For more information, see [Section 18.2.1, “RANGE Partitioning”](#), [Section 18.2.2, “LIST Partitioning”](#), and [Section 18.4, “Partition Pruning”](#).

- **Partitioning:** A new `ALTER TABLE` option, `TRUNCATE PARTITION`, makes it possible to delete rows from one or more selected partitions only. Unlike the case with `ALTER TABLE ... DROP PARTITION`, `ALTER TABLE ... TRUNCATE PARTITION` merely deletes all rows from the specified partition or partitions, and does not change the definition of the table.
- **Partitioning:** It is now possible to assign indexes on partitioned `MyISAM` tables to key caches using the `CACHE INDEX` and to preload such indexes into the cache using `LOAD INDEX INTO CACHE` statements. Cache assignment and preloading of indexes for such tables can be performed for one, several, or all partitions of the table.

This functionality is supported for only those partitioned tables that employ the `MyISAM` storage engine.

- **Replication:** The global server variable `sync_relay_log` is introduced for use on replication slaves. Setting this variable to a nonzero integer value `N` causes the slave to synchronize the relay log to disk after every `N` events. Setting its value to 0 permits the operating system to handle synchronization of the file. The action of this variable, when enabled, is analogous to how the `sync_binlog` variable works with regard to binary logs on a replication master.

The global server variables `sync_master_info` and `sync_relay_log_info` are introduced for use on replication slaves to control synchronization of, respectively, the `master.info` and `relay.info` files.

In each case, setting the variable to a nonzero integer value `N` causes the slave to synchronize the corresponding file to disk after every `N` events. Setting its value to 0 permits the operating system to handle synchronization of the file instead.

The actions of these variables, when enabled, are analogous to how the `sync_binlog` variable works with regard to binary logs on a replication master.

An additional system variable `relay_log_recovery` is also now available. When enabled, this variable causes a replication slave to discard relay log files obtained from the replication master following a crash.

These variables can also be set in `my.cnf`, or by using the `--sync-relay-log`, `--sync-master-info`, `--sync-relay-log-info`, and `--relay-log-recovery` server options.

For more information, see [Section 17.1.3.3, “Replication Slave Options and Variables”](#). ([Bug#31665](#), [Bug#35542](#), [Bug#40337](#))

- **Replication:** Because `SHOW BINLOG EVENTS` cannot be used to read events from relay log files, a new `SHOW RELAYLOG EVENTS` statement has been added for this purpose. ([Bug#28777](#))
- **Replication:** In circular replication, it was sometimes possible for an event to propagate such that it would be reapplied on all servers. This could occur when the originating server was removed from the replication circle and so could no longer act as the

terminator of its own events, as normally happens in circular replication.

To prevent this from occurring, a new `IGNORE_SERVER_IDS` option is introduced for the `CHANGE MASTER TO` statement. This option takes a list of replication server IDs; events having a server ID which appears in this list are ignored and not applied. For more information, see [Section 12.5.2.1, “`CHANGE MASTER TO` Syntax”](#).

In conjunction with the introduction of `IGNORE_SERVER_IDS`, `SHOW SLAVE STATUS` has two new fields. `Replicate_Ignore_Server_Ids` displays information about ignored servers. `Master_Server_Id` displays the `server_id` value from the master. ([Bug#25998](#))

See also [Bug#27808](#).

- **Replication:** A replication heartbeat mechanism has been added to facilitate monitoring. This provides an alternative to checking log files, making it possible to detect in real time when a slave has failed.

Configuration of heartbeats is done using a new `MASTER_HEARTBEAT_PERIOD = interval` clause for the `CHANGE MASTER TO` statement (see [Section 12.5.2.1, “`CHANGE MASTER TO` Syntax”](#)); monitoring can be done by checking the values of the status variables `Slave_heartbeat_period` and `Slave_received_heartbeats` (see [Section 5.1.6, “Server Status Variables”](#)).

The addition of replication heartbeats addresses a number of issues:

- Relay logs were rotated every `slave_net_timeout` seconds even if no statements were being replicated.
- `SHOW SLAVE STATUS` displayed an incorrect value for `Seconds_Behind_Master` following a `FLUSH LOGS` statement.
- Replication master-slave connections used `slave_net_timeout` for connection timeouts. ([Bug#20435](#), [Bug#29309](#), [Bug#30932](#))
- **Replication:** MySQL now supports an interface for semisynchronous replication: A commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through an optional plugin component. See [Section 17.3.8, “Semisynchronous Replication”](#).
- On Linux (and perhaps other systems), the performance of MySQL Server can be improved by using a different `malloc()` implementation, developed by Google and called `tcmalloc`. The gain is noticeable with a higher number of simultaneous users. To support use of this library, the following changes have been made:
 - The server is linked against the default `malloc()` provided by the respective platform.
 - Binary distributions for Linux include `libtcmalloc_minimal.so` (a shared library that can be linked against at runtime) in `pkglibdir` (that is, the same directory within the package where server plugins and similar object files are located). The version of `tcmalloc` included with MySQL comes from `google-perf-tools` 1.4.

If you want to try `tcmalloc` but are using a binary distribution for a non-Linux platform or a source distribution, you can install Google's `tcmalloc`. Some distributions provide it in a `google-perf-tools` package or with a similar name, or you can download it from Google at <http://code.google.com/p/google-perf-tools/> and compile it yourself.

- `mysqld_safe` now supports a `--malloc-lib` option that enables administrators to specify that `mysqld` should use `tcmalloc`.

The `--malloc-lib` option works by modifying the `LD_PRELOAD` environment value to affect dynamic linking to enable the loader to find the memory-allocation library when `mysqld` runs:

- If the option is not given, or is given without a value (`--malloc-lib=`), `LD_PRELOAD` is not modified and no attempt is made to use `tcmalloc`.
- If the option is given as `--malloc-lib=tcmalloc`, `mysqld_safe` looks for a `tcmalloc` library in `/usr/lib` and then in the MySQL `pkglibdir` location (for example, `/usr/local/mysql/lib` or whatever is appropriate). If `tmalloc` is found, its path name is added to the beginning of the `LD_PRELOAD` value for `mysqld`. If `tcmalloc` is not found, `mysqld_safe` aborts with an error.
- If the option is given as `--malloc-lib=/path/to/some/library`, that full path is added to the beginning of the `LD_PRELOAD` value. If the full path points to a nonexistent or unreadable file, `mysqld_safe` aborts with an error.
- For cases where `mysqld_safe` adds a path name to `LD_PRELOAD`, it adds the path to the beginning of any existing value the variable already has.

As a result of the preceding changes, Linux users can use the `libtcmalloc_minimal.so` now included in binary packages by adding these lines to the `my.cnf` file:

```
[mysqld_safe]
malloc-lib=tcmalloc
```

Those lines also suffice for users on any platform who have installed a `tcmalloc` package in `/usr/lib`. To use a specific `tcmalloc` library, specify its full path name. Example:

```
[mysqld_safe]
malloc-lib=/opt/lib/libtcmalloc_minimal.so
```

(Bug#47549)

- The `InnoDB` buffer pool is divided into two sublists: A new sublist containing blocks that are heavily used by queries, and an old sublist containing less-used blocks and from which candidates for eviction are taken. In the default operation of the buffer pool, a block when read in is loaded at the midpoint and then moved immediately to the head of the new sublist as soon as an access occurs. In the case of a table scan (such as performed for a `mysqldump` operation), each block read by the scan ends up moving to the head of the new sublist because multiple rows are accessed from each block. This occurs even for a one-time scan, where the blocks are not otherwise used by other queries. Blocks may also be loaded by the read-ahead background thread and then moved to the head of the new sublist by a single access. These effects can be disadvantageous because they push blocks that are in heavy use by other queries out of the new sublist to the old sublist where they become subject to eviction.

`InnoDB` now provides two system variables that enable LRU algorithm tuning:

- `innodb_old_blocks_pct`

Specifies the approximate percentage of the buffer pool used for the old block sublist. The range of values is 5 to 95. The default value is 37 (that is, 3/8 of the pool).

- `innodb_old_blocks_time`

Specifies how long in milliseconds (ms) a block inserted into the old sublist must stay there after its first access before it can be moved to the new sublist. The default value is 0: A block inserted into the old sublist moves immediately to the new sublist the first time it is accessed, no matter how soon after insertion the access occurs. If the value is greater than 0, blocks remain in the old sublist until an access occurs at least that many ms after the first access. For example, a value of 1000 causes blocks to stay in the old sublist for 1 second after the first access before they become eligible to move to the new sublist. See [Section 7.9.1, “The InnoDB Buffer Pool”](#)

For additional information, see [Section 7.9.1, “The InnoDB Buffer Pool”](#). (Bug#45015)

- Two status variables have been added to `SHOW STATUS` output. `Innodb_buffer_pool_read_ahead` and `Innodb_buffer_pool_read_ahead_evicted` indicate the number of pages read in by the `InnoDB` read-ahead background thread, and the number of such pages evicted without ever being accessed, respectively. Also, the status variables `Innodb_buffer_pool_read_ahead_rnd` and `Innodb_buffer_pool_read_ahead_seq` status variables have been removed. (Bug#42885)
- Columns that provide a catalog value in `INFORMATION_SCHEMA` tables (for example, `TABLES.TABLE_CATALOG`) now have a value of `def` rather than `NULL`. (Bug#35427)
- The deprecated `--default-table-type` server option has been removed. (Bug#34818)
- Previously, `mysqldump` would not dump the `INFORMATION_SCHEMA` database and ignored it if it was named on the command line. Now, `mysqldump` will dump `INFORMATION_SCHEMA` if it is named on the command line. Currently, this requires that the `--skip-lock-tables` (or `--skip-opt`) option be given. (Bug#33762)
- Several undocumented C API functions were removed: `mysql_manager_close()`, `mysql_manager_command()`, `mysql_manager_connect()`, `mysql_manager_fetch_line()`, `mysql_manager_init()`, `mysql_disable_reads_from_master()`, `mysql_disable_rpl_parse()`, `mysql_enable_reads_from_master()`, `mysql_enable_rpl_parse()`, `mysql_master_query()`, `mysql_master_send_query()`, `mysql_reads_from_master_enabled()`, `mysql_rpl_parse_enabled()`, `mysql_rpl_probe()`, `mysql_rpl_query_type()`, `mysql_set_master()`, `mysql_slave_query()`, and `mysql_slave_send_query()`. (Bug#31952, Bug#31954)
- Sinhala collations `utf8_sinhala_ci` and `ucs2_sinhala_ci` were added for the `utf8` and `ucs2` character sets. (Bug#26474)
- If the value of the `--log-warnings` option is greater than 1, the server now writes access-denied errors for new connection attempts to the error log (for example, if a client user name or password is incorrect). (Bug#25822)
- On WIndows, use of POSIX I/O interfaces in `mysys` was replaced with Win32 API calls (`CreateFile()`, `WriteFile()`, and so forth) and the default maximum number of open files has been increased to 16384. The maximum can be increased fur-

ther by using the `--open-files-limit=N` option at server startup. ([Bug#24509](#))

- The `TRADITIONAL` SQL mode now includes `NO_ENGINE_SUBSTITUTION`. ([Bug#21099](#))
- MySQL now implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See [Section 12.7.8, “SIGNAL and RESIGNAL”](#). ([Bug#11661](#))
- The undocumented, deprecated, and not useful `SHOW COLUMN TYPES` statement has been removed. ([Bug#5299](#))
- The `libmysqlclient` client library is now built as a thread-safe library. The `libmysqlclient_r` client library is still present for compatibility, but is just a symlink to `libmysqlclient`.
- The `FORMAT()` function now supports an optional third parameter that enables a locale to be specified to be used for the result number's decimal point, thousands separator, and grouping between separators. Permissible locale values are the same as the legal values for the `lc_time_names` system variable (see [Section 9.7, “MySQL Server Locale Support”](#)). For example, the result from `FORMAT(1234567.89, 2, 'de_DE')` is `1.234.567,89`. If no locale is specified, the default is '`en_US`'.
- The Greek locale '`el_GR`' is now a permissible value for the `lc_time_names` system variable.
- Previously, in the absence of other information, the MySQL client programs `mysql`, `mysqladmin`, `mysqlcheck`, `mysqlimport`, and `mysqlshow` used the compiled-in default character set, usually `latin1`.

Now these clients can autodetect which character set to use based on the operating system setting, such as the value of the `LANG` or `LC_ALL` locale environment language on Unix system or the code page setting on Windows systems. For systems on which the locale is available from the OS, the client uses it to set the default character set rather than using the compiled-in default. Thus, users can configure the locale in their environment for use by MySQL clients. For example, setting `LANG` to `ru_RU.KOI8-R` causes the `koi8r` character set to be used. The OS character set is mapped to the closest MySQL character set if there is no exact match. If the client does not support the matching character set, it uses the compiled-in default. (For example, `ucs2` is not supported as a connection character set.)

An implication of this change is that if your environment is configured to use a non-`latin1` locale, MySQL client programs will use a different connection character set than previously, as though you had issued an implicit `SET NAMES` statement.

Third-party applications that wish to use character set autodetection based on the OS setting can use the following `mysql_options()` call before connecting to the server:

```
mysql_options(mysql,
              MYSQL_SET_CHARSET_NAME,
              MYSQL_AUTO_DETECT_CHARSET_NAME);
```

See [Section 9.1.4, “Connection Character Sets and Collations”](#).

- `mysql_upgrade` now has an `--upgrade-system-tables` option that causes only the system tables to be upgraded. With this option, data upgrades are not performed.
- The `CREATE TABLESPACE` privilege has been introduced. This privilege exists at the global (superuser) level and enables you to create, alter, and drop tablespaces and logfile groups.
- The server now supports a Debug Sync facility for thread synchronization during testing and debugging. To compile in this facility, configure MySQL with the `--enable-debug-sync` option. The `debug_sync` system variable provides the user interface Debug Sync. `mysqld` and `mysql-test-run.pl` support a `--debug-sync-timeout` option to enable the facility and set the default synchronization point timeout.
- Added the `TO_SECONDS()` function, which converts a date or datetime value to a number of seconds since the year 0.
- Parser performance was improved for identifier scanning and conversion of ASCII string literals.
- The `LOAD XML INFILE` statement was added. This statement makes it possible to read data directly from XML files into database tables. For more information, see [Section 12.2.7, “LOAD XML Syntax”](#).

Bugs fixed:

- **Performance:** The server unnecessarily acquired a query cache mutex even with the query cache disabled, resulting in a small performance decrement which could show up as threads often in state “invalidating query cache entries (table)”, particularly on a replication slave with row-based replication. Now if the server is started with `query_cache_type` set to 0, it does not acquire the query cache mutex. This has the implication that the query cache cannot be enabled at runtime. ([Bug#38551](#))
- **Performance:** The `InnoDB` adaptive hash latch is released (if held) for several potentially long-running operations. This improves throughput for other queries if the current query is removing a temporary table, changing a temporary table from

memory to disk, using `CREATE TABLE ... SELECT`, or performing a `MyISAM` repair on a table used within a transaction. ([Bug#32149](#))

- **Important Change: Security Fix:** It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` is no longer permitted. This is now also true of these options when used with partitioned tables and individual partitions of such tables. ([Bug#32167](#), [CVE-2008-2079](#))

See also [Bug#39277](#).

- **Security Fix:** MySQL clients linked against OpenSSL can be tricked not to check server certificates. ([Bug#47320](#), [CVE-2009-4028](#))

- **Security Fix:** The server crashed if an account without the proper privileges attempted to create a stored procedure. ([Bug#44658](#))

- **Incompatible Change: Replication:** Concurrent transactions that inserted rows into a table with an `AUTO_INCREMENT` column could break statement-based or mixed-format replication error 1062 `DUPLICATE ENTRY '...' FOR KEY 'PRIMARY'` on the slave. This was especially likely to happen when one of the transactions activated a trigger that inserted rows into the table with the `AUTO_INCREMENT` column, although other conditions could also cause the issue to manifest.

As part of the fix for this issue, any statement that causes a trigger or function to update an `AUTO_INCREMENT` column is now considered unsafe for statement-based replication. For more information, see [Section 17.4.1.1, “Replication and AUTO_INCREMENT”](#). ([Bug#45677](#))

See also [Bug#42415](#), [Bug#48608](#), [Bug#50440](#), [Bug#53079](#).

- **Incompatible Change:** For system variables that take values of `ON` or `OFF`, `OF` was accepted as a legal variable. Now system variables that take “enumeration” values must be assigned the full value. This affects some other variables that previously could be assigned using unambiguous prefixes of permissible values, such as `tx_isolation`. ([Bug#34828](#))

- **Incompatible Change:** In binary installations of MySQL, the supplied `binary-configure` script would start and configure MySQL, even when command help was requested with the `--help` command-line option. The `--help`, if provided, will no longer start and install the server. ([Bug#30954](#))

- **Incompatible Change:** Access privileges for several statements are more accurately checked:

- `CHECK TABLE` requires some privilege for the table.
- `CHECKSUM TABLE` requires `SELECT` for the table.
- `CREATE TABLE ... LIKE` requires `SELECT` for the source table and `CREATE` for the destination table.
- `SHOW COLUMNS` displays information only for those columns you have some privilege for.
- `SHOW CREATE TABLE` requires some privilege for the table (previously required `SELECT`).
- `SHOW CREATE VIEW` requires `SHOW VIEW` and `SELECT` for the view.
- `SHOW INDEX` requires some privilege for any column.
- `SHOW OPEN TABLES` displays only tables for which you have some privilege on any table column.

([Bug#27145](#))

- **Important Change: Replication:** `MyISAM` transactions replicated to a transactional slave left the slave in an unstable condition. This was due to the fact that, when replicating from a nontransactional storage engine to a transactional engine with `autocommit` turned off, no `BEGIN` and `COMMIT` statements were written to the binary log; thus, on the slave, a never-ending transaction was started.

The fix for this issue includes enforcing `autocommit` mode on the slave by replicating all `autocommit=1` statements from the master. ([Bug#29288](#))

- **Important Change: Replication:** The `CHANGE MASTER TO` statement required the value for `RELAY_LOG_FILE` to be an absolute path, while the `MASTER_LOG_FILE` path could be relative.

The inconsistent behavior is resolved by permitting relative paths for `RELAY_LOG_FILE`, and by using the same basename for `RELAY_LOG_FILE` as for `MASTER_LOG_FILE`. For more information, see [Section 12.5.2.1, “CHANGE MASTER TO Syntax”](#). ([Bug#12190](#))

- **Important Change:** An option that requires a value, when specified in an option file without a value, was assigned the text of

the next line in the file as the value. Now, if you fail to specify a required value in an option file, the server aborts with an error.

This change does not effect how options are handled by the server when they are used on the command line. For example, starting the server using `mysqld_safe --relay-log --relay-log-index &` causes the server to create relay log files named `--relay-log-index.000001`, `--relay-log-index.000002`, and so on, because the `--relay-log` option expects an argument. ([Bug#25192](#))

- **Partitioning:** An `ALTER TABLE ... ADD PARTITION` statement that caused `open_files_limit` to be exceeded led to a crash of the MySQL server. ([Bug#46922](#))

See also [Bug#47343](#).

- **Partitioning:** When performing an `INSERT ... SELECT` into a partitioned table, `read_buffer_size` bytes of memory were allocated for every partition in the target table, resulting in consumption of large amounts of memory when the table had many partitions (more than 100).

This fix changes the method used to estimate the buffer size required for each partition and limits the total buffer size to a maximum of approximately 10 times `read_buffer_size`. ([Bug#45840](#))

- **Partitioning:** The cardinality of indexes on partitioned tables was calculated using the first partition in the table, which could result in suboptimal query execution plans being chosen. Now the partition having the most records is used instead, which should result in better use of indexes and thus improved performance of queries against partitioned tables in many if not most cases. ([Bug#44059](#))
- **Partitioning:** Truncating a partitioned `MyISAM` table did not reset the `AUTO_INCREMENT` value. ([Bug#35111](#))
- **Partitioning:** For partitioned tables with more than ten partitions, a full table scan was used in some cases when only a subset of the partitions were needed. ([Bug#33730](#))
- **Replication:** When using statement-based or mixed-format replication, the database name was not written to the binary log when executing a `LOAD DATA` statement. This caused problems when the table being loaded belonged to a database other than the current database; data could be loaded into the wrong table (if a table having the same name existed in the current database) or replication could fail (if no table having that name existed in the current database). Now a table referenced in a `LOAD DATA` statement is always logged using its fully qualified name when the database to which it belongs is not the current database. ([Bug#48297](#))
- **Replication:** When a session was closed on the master, temporary tables belonging to that session were logged with the wrong database names when either of the following conditions was true:
 1. The length of the name of the database to which the temporary table belonged was greater than the length of the current database name.
 2. The current database was not set.

([Bug#48216](#))

See also [Bug#46861](#), [Bug#48297](#).

- **Replication:** When using row-based replication, changes to nontransactional tables that occurred early in a transaction were not immediately flushed upon committing a statement. This behavior could break consistency since changes made to nontransactional tables become immediately visible to other connections. ([Bug#47678](#))

See also [Bug#47287](#), [Bug#46864](#), [Bug#43929](#), [Bug#46129](#).

- **Replication:** When `mysqlbinlog --verbose` was used to read a binary log that had been recorded using the row-based format, the output for events that updated some but not all columns of tables was not correct. ([Bug#47323](#))
- **Replication:** Performing `ALTER TABLE ... DISABLE KEYS` on a slave table caused row-based replication to fail. ([Bug#47312](#))
- **Replication:** When using the row-based format to replicate a transaction involving both transactional and nontransactional engines, which contained a DML statement affecting multiple rows, the statement failed; if this transaction was followed by a `COMMIT`, the master and the slave could diverge, because the statement was correctly rolled back on the master, but was applied on the slave. ([Bug#47287](#))

See also [Bug#46864](#).

- **Replication:** `BEGIN` statements were not included in the output of `mysqlbinlog`. ([Bug#46998](#))
- **Replication:** A problem with the `BINLOG` statement in the output of `mysqlbinlog` could break replication; statements could be logged with the server ID stored within events by the `BINLOG` statement rather than the ID of the running server. With this

fix, the server ID of the server executing the statements can no longer be overridden by the server ID stored in the binary log's `format_description` statement. ([Bug#46640](#))

This regression was introduced by [Bug#32407](#).

- **Replication:** When using row-based replication, `DROP TEMPORARY TABLE IF EXISTS` was written to the binary log if the table named in the statement did not exist, even though a `DROP TEMPORARY TABLE` statement should never be logged in row-based logging mode, whether the table exists or not. ([Bug#46572](#))
- **Replication:** The internal function `get_master_version_and_clock()` (defined in `sql/slave.cc`) ignored errors and passed directly when queries failed, or when queries succeeded but the result retrieved was empty. Now this function tries to reconnect the master if a query fails due to transient network problems, and to fail otherwise. The I/O thread now prints a warning if the same system variables do not exist on master (in the event the master is a very old version of MySQL, compared to the slave.) ([Bug#45214](#))
- **Replication:** Replicating `TEXT` or `VARCHAR` columns declared as `NULL` on the master but `NOT NULL` on the slave caused the slave to crash. ([Bug#43789](#))

See also [Bug#38850](#), [Bug#43783](#), [Bug#43785](#), [Bug#47741](#), [Bug#48091](#).

- **Replication:** By default, all statements executed by the `mysql_upgrade` program on the master are written to the binary log, then replicated to the slave. In some cases, this can result in problems; for example, it attempted to alter log tables on replicated databases (this failed due to logging being enabled).

As part of this fix, a `mysql_upgrade` option, `--write-binlog`, is added. Its inverse, `--skip-write-binlog`, can be used to disable binary logging while the upgrade is in progress. ([Bug#43579](#))

- **Replication:** This fix handles 2 issues encountered on replication slaves during startup:
 1. A failure while allocating the master info structure caused the slave to crash.
 2. A failure during recovery caused the relay log file not to be properly initialized which led to a crash on the slave.

([Bug#43075](#))
- **Replication:** When the logging format was set without binary logging being enabled, the server failed to start. Now in such cases, the server starts successfully, `binlog_format` is set, and a warning is logged instead of an error. ([Bug#42928](#))
- **Replication:** On the master, if a binary log event is larger than `max_allowed_packet`, the error message `ER_MASTER_FATAL_ERROR_READING_BINLOG` is sent to a slave when it requests a dump from the master, thus leading the I/O thread to stop. On a slave, the I/O thread stops when receiving a packet larger than `max_allowed_packet`.

In both cases, however, there was no `Last_IO_Error` reported, which made it difficult to determine why the slave had stopped in such cases. Now, `Last_IO_Error` is reported when `max_allowed_packet` is exceeded, and provides the reason for which the slave I/O thread stopped. ([Bug#42914](#))

See also [Bug#14068](#), [Bug#47200](#), [Bug#47303](#).

- **Replication:** When using statement-based replication and the transaction isolation level was set to `READ COMMITTED` or a less strict level, `InnoDB` returned an error even if the statement in question was filtered out according to the `-binlog-do-db` or `--binlog-ignore-db` rules in effect at the time. ([Bug#42829](#))
- **Replication:** When using row-based format, replication failed with the error `COULD NOT EXECUTE WRITE_ROWS EVENT ON TABLE ...; FIELD '...' DOESN'T HAVE A DEFAULT VALUE` when an `INSERT` was made on the master without specifying a value for a column having no default, even if strict server SQL mode was not in use and the statement would otherwise have succeeded on the master. Now the SQL mode is checked, and the statement is replicated unless strict mode is in effect. For more information, see [Section 5.1.7, “Server SQL Modes”](#). ([Bug#38173](#))

See also [Bug#38262](#), [Bug#43992](#).

- **Replication:** When `autocommit` was set equal to `1` after starting a transaction, the binary log did not commit the outstanding transaction. The reason this happened was that the binary log commit function saw only the values of the new settings, and decided that there was nothing to commit.

This issue was first observed when using the `Falcon` storage engine, but it is possible that it affected other storage engines as well. ([Bug#37221](#))

- **Replication:** `FLUSH LOGS` did not close and reopen the binary log index file. ([Bug#34582](#))

See also [Bug#48738](#).

- **Replication:** An error message relating to permissions required for `SHOW SLAVE STATUS` was confusing. ([Bug#34227](#))
- **Replication:** The `--base64-output` option for `mysqlbinlog` was not honored for all types of events. This interfered in some cases with performing point-in-time recovery. ([Bug#32407](#))
See also [Bug#46640](#), [Bug#34777](#).
- **Replication:** The value of `Slave_IO_running` in the output of `SHOW SLAVE STATUS` did not distinguish between all 3 possible states of the slave I/O thread (not running; running but not connected; connected). Now the value `Connecting` (rather than `No`) is shown when the slave I/O thread is running but the slave is not connected to a replication master.

The server system variable `Slave_running` also reflects this change, and is now consistent with what is shown for `Slave_IO_running`. ([Bug#30703](#), [Bug#41613](#), [Bug#51089](#))

- **Replication:** Queries which were written to the slow query log on the master were not written to the slow query log on the slave. ([Bug#23300](#))
See also [Bug#48632](#).
- **Replication:** Valgrind revealed an issue with `mysqld` that was corrected: memory corruption in replication slaves when switching databases. ([Bug#19022](#))
- **API:** The fix for [Bug#24507](#) could lead in some cases to client application failures due to a race condition. Now the server waits for the “dummy” thread to return before exiting, thus making sure that only one thread can initialize the POSIX threads library. ([Bug#42850](#))
- Certain `INTERVAL` expressions could cause a crash on 64-bit systems. ([Bug#48739](#))
- Following a literal, the `COLLATE` clause was mishandled such that different results could be produced depending on whether an index was used. ([Bug#48447](#))
- `SUM()` artificially increased the precision of a `DECIMAL` argument, which was truncated when a temporary table was created to hold the results. ([Bug#48370](#))

See also [Bug#45261](#).

- `GRANT` and `REVOKE` crashed if a user name was specified as `CURRENT_USER()`. ([Bug#48319](#))
- If an outer query was invalid, a subquery might not even be set up. `EXPLAIN EXTENDED` did not expect this and caused a crash by trying to dereference improperly set up information. ([Bug#48295](#))
- A query containing a view using temporary tables and multiple tables in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash.

As a result of this bug fix, `PROCEDURE ANALYSE()` is legal only in a top-level `SELECT`. ([Bug#48293](#))

See also [Bug#46184](#).

- Error handling was missing for `SELECT` statements containing subqueries in the `WHERE` clause and that assigned a `SELECT` result to a user variable. The server could crash as a result. ([Bug#48291](#))
- An assertion could fail if the optimizer used a `SPATIAL` index. ([Bug#48258](#), [Bug#47019](#))
- Memory-allocation failures were handled incorrectly in the `InnoDB os_mem_alloc_large()` function. ([Bug#48237](#))
- `WHERE` clauses with `outer_value_list NOT IN subquery` were handled incorrectly if the outer value list contained multiple items at least one of which could be `NULL`. ([Bug#48177](#))
- Searches using a non-default collation could return different results for a table when partitioning was and was not used. ([Bug#48161](#))
- A combination of `GROUP BY WITH ROLLUP, DISTINCT` and the `const` join type in a query caused a server crash when the optimizer chose to employ a temporary table to resolve `DISTINCT`. ([Bug#48131](#))
- The subquery optimizer had a memory leak. ([Bug#48060](#))
- Server shutdown failed on Windows. ([Bug#48047](#))
- In some cases, using a null microsecond part in a `WHERE` condition (for example, `WHERE date_time_field <= 'YYYY-MM-DD HH:MM:SS.0000'`) could lead to incorrect results due to improper `DATETIME` comparison. ([Bug#47963](#))

- A build configured using the `--without-server` option did not compile the yaSSL code, so if `--with-ssl` was also used, the build failed. ([Bug#47957](#))
- When a query used a `DATE` or `DATETIME` value formatted using any separator characters other than hyphen (' - ') and a `>=` condition matching only the greatest value in an indexed column, the result was empty if an index range scan was employed. ([Bug#47925](#))
- `mysys/mf_keycache.c` requires threading, but no test was made for thread support. ([Bug#47923](#))
- For debug builds, an assertion could fail during the next statement executed for a temporary table after a multiple-table `UPDATE` involving that table and modified an `AUTO_INCREMENT` column with a user-supplied value. ([Bug#47919](#))
- The `mysys/mf_strip.c` file, which defines the `strip_sp()` function, has been removed from the MySQL source. The function was no longer used within the main build, and the supplied function was causing symbol errors on Windows builds. ([Bug#47857](#))
- When building storage engines on Windows it was not possible to specify additional libraries within the `CMake` file required for the build. An `_${engine}_LIBS` macro has been included in the files to support these additional storage-engine specific libraries. ([Bug#47797](#))
- When building a pluggable storage engine on Windows, the engine name could be based on the directory name where the engine was located, rather than the configured storage engine name. ([Bug#47795](#))
- During cleanup of a stored procedure's internal structures, the flag to ignore the errors for `INSERT IGNORE` or `UPDATE IGNORE` was not cleaned up, which could result in a server crash. ([Bug#47788](#))
- If the first argument to `GeomFromWKB()` function was a geometry value, the function just returned its value. However, it failed to preserve the argument's `null_value` flag, which caused an unexpected `NULL` value to be returned to the caller, resulting in a server crash. ([Bug#47780](#))
- `InnoDB` could crash when updating spatial values. ([Bug#47777](#))
- The `pthread_cond_wait()` implementations for Windows could deadlock in some rare circumstances. ([Bug#47768](#))
- The encoding of values for `SET system_variable = identifier` statements was incorrect, resulting in incorrect error messages. ([Bug#47597](#))
- On Windows, when an idle named pipe connection was forcibly closed with a `KILL` statement or because the server was being shut down, the thread that was closing the connection would hang infinitely.

As a result of the work done for this bug, the `net_read_timeout` and `net_write_timeout` system variables now apply to connections over all transports, not just to TCP/IP. ([Bug#47571](#), [Bug#31621](#))

- On Mac OS X or Windows, sending a `SIGHUP` signal to the server or an asynchronous flush (triggered by `flush_time`) caused the server to crash. ([Bug#47525](#))
- Debug builds could not be compiled with the Sun Studio compiler. ([Bug#47474](#))
- Queries of the form `SELECT SUM(DISTINCT varchar_key) FROM tbl_name` caused a server crash. ([Bug#47421](#))
- A function call could end without throwing an error or setting the return value. For example, this could happen when an error occurred while calculating the return value. This is fixed by setting the value to `NULL` when an error occurs during evaluation of an expression. ([Bug#47412](#))
- `mysqladmin debug` could crash on 64-bit systems. ([Bug#47382](#))
- A simple `SELECT` with implicit grouping could return many rows rather than a single row if the query was ordered by the aggregated column in the select list. ([Bug#47280](#))
- An assertion could be raised for `CREATE TABLE` if there was a pending `INSERT DELAYED` or `REPLACE DELAYED` for the same table. ([Bug#47274](#))
- `InnoDB` raised errors in some cases in a manner not compatible with `SIGNAL` and `RESIGNAL`. ([Bug#47233](#))
- A multiple-table `UPDATE` involving a natural join and a mergeable view raised an assertion. ([Bug#47150](#))
- On FreeBSD, memory mapping for `MERGE` tables could fail if underlying tables were empty. ([Bug#47139](#))
- Solaris binary packages now are compiled with `-g0` rather than `-g`. ([Bug#47137](#))
- If an `InnoDB` table was created with the `AUTO_INCREMENT` table option to specify an initial auto-increment value, and an in-

dex was added in a separate operation later, the auto-increment value was lost (subsequent inserts began at 1 rather than the specified value). ([Bug#47125](#))

- Incorrect handling of predicates involving `NUL` by the range optimizer could lead to an infinite loop during query execution. ([Bug#47123](#))
- `EXPLAIN` caused a server crash for certain valid queries. ([Bug#47106](#))
- Repair by sort or parallel repair of `MyISAM` tables could fail to fail over to repair with key cache. ([Bug#47073](#))
- `InnoDB` did not compile on some Solaris systems. ([Bug#47058](#))
- On WIndows, when a failed I/O operation occurred with return code of `ERROR_WORKING_SET_QUOTA`, `InnoDB` intentionally crashed the server. Now `InnoDB` sleeps for 100ms and retries the failed operation. ([Bug#47055](#))
- The `mysql_config` script contained a reference to `@innodb_system_libs@` that was not replaced with the corresponding library flags during the build process and ended up in the output of `mysql_config --libs`. ([Bug#47007](#))
- The `configure` option `--without-server` did not work. ([Bug#46980](#))
- `InnoDB` now ignores negative values supplied by a user for an `AUTO_INCREMENT` column when calculating the next value to store in the data dictionary. Setting `AUTO_INCREMENT` columns to negative values is undefined behavior and this change should bring the behavior of `InnoDB` closer to what users expect. ([Bug#46965](#))
- Failed multiple-table `DELETE` statements could raise an assertion. ([Bug#46958](#))
- When MySQL crashed (or a snapshot was taken that simulates a crash), it was possible that internal XA transactions (used to synchronize the binary log and `InnoDB`) could be left in a `PREPARED` state, whereas they should be rolled back. This occurred when the `server_id` value changed before the restart, because that value was used to construct XID values.

Now the restriction is relaxed that the `server_id` value be consistent for XID values to be considered valid. The rollback phase should then be able to clean up all pending XA transactions. ([Bug#46944](#))

- When creating a new instance on Windows using `mysqld-nt` and the `--install` parameter, the value of the service would be set incorrectly, resulting in a failure to start the configured service. ([Bug#46917](#))
- The test suite was missing from RPM packages. ([Bug#46834](#))
- For `InnoDB` tables, an unnecessary table rebuild for `ALTER TABLE` could sometimes occur for metadata-only changes. ([Bug#46760](#))
- The server could crash for queries with the following elements: 1. An “impossible where” in the outermost `SELECT`; 2. An aggregate in the outermost `SELECT`; 3. A correlated subquery with a `WHERE` clause that includes an outer field reference as a top-level `WHERE` sargable predicate; ([Bug#46749](#))
- `InnoDB` did not compile using `gcc` 4.1 on PPC systems. ([Bug#46718](#))
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. ([Bug#46672](#))

See also [Bug#18828](#).

- A Valgrind error during index creation by `InnoDB` was corrected. ([Bug#46657](#))
- Concurrent `INSERT INTO ... SELECT` statements for an `InnoDB` table could cause an `AUTO_INCREMENT` assertion failure. ([Bug#46650](#))
- The Serbian locale name '`sr_YU`' is obsolete. It is still recognized for backward compatibility, but '`sr_RS`' now should be used instead. ([Bug#46633](#))
- On Solaris and HP-UX systems with the environment set to the default `C` locale, MySQL client programs issued an `Unknown OS character set` error. ([Bug#46619](#))
- `SHOW CREATE TRIGGER` for a `MERGE` table trigger caused an assertion failure. ([Bug#46614](#))
- `DIV` operations that are out of range generated an error `Error (Code 1264): Out of range value` (correct), but also an error: `Error (Code 1041): Out of memory` (incorrect). ([Bug#46606](#))
- If a transaction was rolled back inside `InnoDB` due to a deadlock or lock wait timeout, and a statement in the transaction had an `IGNORE` clause, the server could crash at the end of the statement or on shutdown. ([Bug#46539](#))

- `TRUNCATE TABLE` for a table that was opened with `HANDLER` did not close the handler and left it in an inconsistent state that could lead to a server crash. Now `TRUNCATE TABLE` for a table closes all open handlers for the table. ([Bug#46456](#))
- Trailing spaces were not ignored for user-defined collations that mapped spaces to a character other than 0x20. ([Bug#46448](#))
See also [Bug#29468](#).
- The server crashed if a shutdown occurred while a connection was idle. This happened because of a `NULL` pointer dereference while logging to the error log. ([Bug#46267](#))
- Dropping an `InnoDB` table that used an unknown collation (created on a different server, for example) caused a server crash. ([Bug#46256](#))
- The GPL and commercial license headers had different sizes, so that error log, backtrace, core dump, and cluster trace file line numbers could be off by one if they were not checked against the version of the source used for the build. (For example, checking a GPL build backtrace against commercial sources.) ([Bug#46216](#))
- A query containing a subquery in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash. ([Bug#46184](#))
See also [Bug#48293](#).

- After an error such as a table-full condition, `INSERT IGNORE` could cause an assertion failure for debug builds. ([Bug#46075](#))
- On 64-bit systems, `--skip-innodb` did not skip `InnoDB` startup. ([Bug#46043](#))
- `InnoDB` did not disallow creation of an index with the name `GEN_CLUST_INDEX`, which is used internally. ([Bug#46000](#))
- `CREATE TABLE ... SELECT` could cause a server crash if no default database was selected. ([Bug#45998](#))
- Configuring MySQL for DTrace support resulted in a build failure on Solaris if the directory for the `dtrace` executable was not in `PATH`. ([Bug#45810](#))
- An infinite hang and 100% CPU usage occurred after handler tried to open a merge table.

If the command `mysqladmin shutdown` was executed during the hang, the debug server generated the following assert:

```
mysqld: table.cc:407: void free_table_share(TABLE_SHARE*): Assertion `share->ref_count == 0' failed.  
090610 14:54:04 - mysqld got signal 6 ;
```

([Bug#45781](#))

- During the build of the Red Hat IA64 MySQL server RPM, the system library link order was incorrect. This made the resulting Red Hat IA64 RPM depend on "libc.so.6.1(GLIBC_PRIVATE)(64bit)", thus preventing installation of the package. ([Bug#45706](#))
- The `caseinfo` member of the `CHARSET_INFO` structure was not initialized for user-defined Unicode collations, leading to a server crash. ([Bug#45645](#))
- Appending values to an `ENUM` or `SET` definition is a metadata change for which `ALTER TABLE` need not rebuild the table, but it was being rebuilt anyway. ([Bug#45567](#))
- The `socket` system variable was unavailable on Windows. ([Bug#45498](#))
- The combination of `MIN()` or `MAX()` in the select list with `WHERE` and `GROUP BY` clauses could lead to incorrect results. ([Bug#45386](#))
- Truncation of `DECIMAL` values could lead to assertion failures; for example, when deducing the type of a table column from a literal `DECIMAL` value. ([Bug#45261](#))

See also [Bug#48370](#).

- Client flags were incorrectly initialized for the embedded server, causing several tests in the `jp` test suite to fail. ([Bug#45159](#))
- Concurrent execution of statements requiring a table-level lock and statements requiring a non-table-level write lock for a table could deadlock. ([Bug#45143](#))
- For settings of `lower_case_table_names` greater than 0, some queries for `INFORMATION_SCHEMA` tables left entries with incorrect lettercase in the table definition cache. ([Bug#44738](#))
- `mysqld_safe` could fail to find the `logger` program. ([Bug#44736](#))

- The `have_community_features` system variable was renamed to `have_profiling`.

Previously, to enable profiling, it was necessary to run `configure` with the `--enable-community-features` and `--enable-profiling` options. Now only `--enable-profiling` is needed. ([Bug#44651](#))

- Some Perl scripts in AIX packages contained an incorrect path to the `perl` executable. ([Bug#44643](#))
- With `InnoDB`, renaming a table column and then creating an index on the renamed column caused a server crash to the `.frm` file and the `InnoDB` data directory going out of sync. Now `InnoDB` 1.0.5 returns an error instead: `ERROR 1034 (HY000): Incorrect key file for table 'tbl_name'; try to repair it.` To work around the problem, create another table with the same structure and copy the original table to it. ([Bug#44571](#))
- For debug builds, executing a stored procedure as a prepared statement could sometimes cause an assertion failure. ([Bug#44521](#))
- Using `mysql_stmt_execute()` to call a stored procedure could cause a server crash. ([Bug#44495](#))
- `InnoDB` did not always disallow creating tables containing columns with names that match the names of internal columns, such as `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR`, and `DB_MIX_ID`. ([Bug#44369](#))
- An `InnoDB` error message incorrectly referred to the nonexistent `innodb_max_files_open` variable rather than to `innodb_open_files`. ([Bug#44338](#))
- `SELECT ... WHERE ... IN (NULL, ...)` was executed using a full table scan, even if the same query without the `NULL` used an efficient range scan. ([Bug#44139](#))

See also [Bug#18360](#).

- `InnoDB` use of `SELECT MAX(autoinc_column)` could cause a crash when MySQL data dictionaries went out of sync. ([Bug#44030](#))
 - `LOAD DATA INFILE` statements were written to the binary log in such a way that parsing problems could occur when re-executing the statement from the log. ([Bug#43746](#))
 - Selecting from the process list in the embedded server caused a crash. ([Bug#43733](#))
- See also [Bug#47304](#).
- Attempts to enable `large_pages` with a shared memory segment larger than 4GB caused a server crash. ([Bug#43606](#))
 - For `ALTER TABLE`, renaming a `DATETIME` or `TIMESTAMP` column unnecessarily caused a table copy operation. ([Bug#43508](#))
 - The weekday names for the Romanian `lc_time_names` locale '`ro_RO`' were incorrect. Thanks to Andrei Boros for the patch to fix this bug. ([Bug#43207](#))
 - `XA START` could cause an assertion failure or server crash when it is called after a unilateral rollback issued by the Resource Manager (both in a regular transaction and after an XA transaction). ([Bug#43171](#))
 - Redefining a trigger could cause an assertion failure. ([Bug#43054](#))
 - The `FORCE INDEX FOR ORDER BY` index hint was ignored when join buffering was used. ([Bug#43029](#))
 - `DROP DATABASE` did not clear the message list. ([Bug#43012](#), [Bug#43138](#))
 - The `NUM_FLAG` bit of the `MYSQL_FIELD.flags` member now is set for columns of type `MYSQL_TYPE_NEWDECIMAL`. ([Bug#42980](#))
 - Incorrect handling of range predicates combined with `OR` operators could yield incorrect results. ([Bug#42846](#))
 - Failure to treat `BIT` values as unsigned could lead to unpredictable results. ([Bug#42803](#))
 - For the embedded server on Windows, `InnoDB` crashed when `innodb_file_per_table` was enabled and a table name was in full path format. ([Bug#42383](#))
 - `SHOW ERRORS` returned an empty result set after an attempt to drop a nonexistent table. ([Bug#42364](#))
 - If the server was started with an option that had a missing or invalid value, a subsequent error that would cause normally the server to shut down could cause it to crash instead. ([Bug#42244](#))
 - Some queries with nested outer joins could lead to crashes or incorrect results because an internal data structure was handled

improperly. ([Bug#42116](#))

- The server used the wrong lock type (always `TL_READ` instead of `TL_READ_NO_INSERT` when appropriate) for tables used in subqueries of `UPDATE` statements. This led in some cases to replication failure because statements were written in the wrong order to the binary log. ([Bug#42108](#))
- A Valgrind warning in `open_tables()` was corrected. ([Bug#41759](#))
- In a replication scenario with `innodb_locks_unsafe_for_binlog` enabled on the slave, where rows were changed only on the slave (not through replication), in some rare cases, many messages of the following form were written to the slave error log: `InnoDB: Error: unlock row could not find a 4 mode lock on the record.` ([Bug#41756](#))
- After renaming a user, granting that user privileges could result in the user having additional privileges other than those granted. ([Bug#41597](#))
- The `mysql-stress-test.pl` test script was missing from the `noinstall` packages on Windows. ([Bug#41546](#))
- With a nonstandard `InnoDB` page size, some error messages became inaccurate.

Note

Changing the page size is not a supported operation and there is no guarantee that `InnoDB` will function normally with a page size other than 16KB. Problems compiling or running `InnoDB` may occur. In particular, `ROW_FORMAT=COMPRESSED` in `InnoDB` assumes that the page size is at most 16KB and uses 14-bit pointers.

A version of `InnoDB` built for one page size cannot use data files or log files from a version built for a different page size.

([Bug#41490](#))

- In some cases, the server did not recognize lettercase differences between `GRANT` attributes such as table name or user name. For example, a user was able to perform operations on a table with privileges of another user with the same user name but in a different lettercase.

In consequence of this bug fix, the collation for the `Routine_name` column of the `mysql.proc` table is changed from `utf8_bin` to `utf8_general_ci`. ([Bug#41049](#))

See also [Bug#48872](#).

- When a storage engine plugin failed to initialize before allocating a slot number, it would accidentally unplug the engine installed in slot 0. ([Bug#41013](#))
- Optimized builds of `mysqld` crashed when built with Sun Studio on SPARC platforms. ([Bug#40244](#))
- `CREATE TABLE` failed if a column name in a `FOREIGN KEY` clause was given in a lettercase different from the corresponding index definition. ([Bug#39932](#))
- The `mysql_stmt_close()` C API function did not flush all pending data associated with the prepared statement. ([Bug#39519](#))
- `INFORMATION_SCHEMA` access optimizations did not work properly in some cases. ([Bug#39270](#))
- `ALTER TABLE` neglected to preserve `ROW_FORMAT` information from the original table, which could cause subsequent `ALTER TABLE` and `OPTIMIZE TABLE` statements to lose the row format for `InnoDB` tables. ([Bug#39200](#))
- Simultaneous `ANALYZE TABLE` operations for an `InnoDB` tables could be subject to a race condition. ([Bug#38996](#))
- `mysqldbinlog` had a memory leak in its option-processing code. ([Bug#38468](#))
- The `ALTER ROUTINE` privilege incorrectly permitted `SHOW CREATE TABLE`. ([Bug#38347](#))
- Setting the `general_log_file` or `slow_query_log_file` system variable to a nonconstant expression caused the variable to become unset. ([Bug#38124](#))
- For certain `SELECT` statements using `ref` access, MySQL estimated an incorrect number of rows, which could lead to inefficient query plans. ([Bug#38049](#))
- A workload consisting of `CREATE TABLE ... SELECT` and DML operations could cause deadlock. ([Bug#37433](#))
- The MySQL client library mishandled `EINPROGRESS` errors for connections in nonblocking mode. This could lead to replication failures on hosts capable of resolving both IPv4 and IPv6 network addresses, when trying to resolve `localhost`.

[Bug#37267](#))

See also [Bug#44344](#).

- Previously, `InnoDB` performed `REPLACE INTO T SELECT ... FROM S WHERE ...` by setting shared next-key locks on rows from `S`. Now `InnoDB` selects rows from `S` with shared locks or as a consistent read, as for `INSERT ... SELECT`. This reduces lock contention between sessions. ([Bug#37232](#))
- Some warnings were being reported as errors. ([Bug#36777](#))
- Privileges for `SHOW CREATE VIEW` were not being checked correctly. ([Bug#35996](#))
- Different invocations of `CHECKSUM TABLE` could return different results for a table containing columns with spatial data types. ([Bug#35570](#))
- Result set metadata for columns retrieved from `INFORMATION_SCHEMA` tables did not have the `db` or `org_table` members of the `MYSQL_FIELD` structure set. ([Bug#35428](#))
- `SHOW CREATE EVENT` output did not include the `DEFINER` clause. ([Bug#35297](#))
- For its warning count, the `mysql_info()` C API function could print the number of truncated data items rather than the number of warnings. ([Bug#34898](#))
- Concurrent execution of `FLUSH TABLES` along with `SHOW FUNCTION STATUS` or `SHOW PROCEDURE STATUS` could cause a server crash. ([Bug#34895](#))
- Executing `SHOW MASTER LOGS` as a prepared statement without binary logging enabled caused a crash for debug builds. ([Bug#34741](#))
- There were spurious warnings about "`Truncated incorrect DOUBLE value`" in queries with `MATCH ... AGAINST` and `>` or `<` with a constant (which was reported as an incorrect `DOUBLE` value) in the `WHERE` condition. ([Bug#34374](#))
- A `COMMENT` longer than 64 characters caused `CREATE PROCEDURE` to fail. ([Bug#34197](#))
- `mysql_real_connect()` did not check whether the `MYSQL` connection handler was already connected and connected again even if so. Now an `CR_ALREADY_CONNECTED` error occurs. ([Bug#33831](#))
- `INSTALL PLUGIN` and `UNINSTALL PLUGIN` did not handle plugin identifiers consistently with respect to lettercase. ([Bug#33731](#))
- The default values for the general query log and slow query log file are documented to be based on the server host name and located in the data directory. However, they were in fact being based on the basename and location of the process ID (PID) file. The name and location defaults for the PID file are based on the server host name and data directory, so if it was not assigned a different name explicitly, its defaults were used and the general query log and slow query log file defaults were as documented. But if the PID file was assigned a value with the `--pid-file` option, the defaults for the general query log and slow query log file were incorrect. This has been rectified so that the defaults for all three files are based on the server host name and data directory.

A remaining problem is that the binary log and relay log `.NNNNNNN` and `.index` basename defaults are based on the PID file basename, contrary to the documentation. This issue is to be addressed as [Bug#45359](#). ([Bug#33693](#))

- The `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements are not present in nondebug builds, but attempting to use them resulted in a “syntax error” message. Now the error message indicates that the statements are disabled and that you must use a debug build. ([Bug#33637](#))
- The `LAST_DAY()` and `MAKEDATE()` functions could return `NULL`, but the result metadata indicated `NOT NULL`. Thanks to Hiromichi Watari for the patch to fix this bug. ([Bug#33629](#))
- Instance Manager (`mysqlmanager`) has been removed, but a reference to it still appeared in the `mysql.server` script. ([Bug#33472](#))
- There was a race condition between the event scheduler and the server shutdown thread. ([Bug#32771](#))
- When an `InnoDB` tablespace filled up, an error was logged to the client, but not to the error log. Also, the error message was misleading and did not indicate the real source of the problem. ([Bug#31183](#))
- `ALTER TABLE` statements that added a column and added a nonpartial index on the column failed to add the index. ([Bug#31031](#))
- For `const` tables that were optimized away, `EXPLAIN EXTENDED` displayed them in the `FROM` clause. Now they are not dis-

played. If all tables are optimized away, `FROM DUAL` is displayed. ([Bug#30302](#))

- There were cases where string-to-number conversions would produce warnings for `CHAR` values but not for `VARCHAR` values. ([Bug#28299](#))
- In `mysql`, using Control-C to kill the current query resulted in a `ERROR 1053 (08S01): Server shutdown in progress` message if the query was waiting for a lock. ([Bug#28141](#))
- When building MySQL on Windows from source, the `WITH_BERKELEY_STORAGE_ENGINE` option would fail to configure `BDB` support correctly. ([Bug#27693](#))
- The default database is no longer changed to `NULL` (“no database”) if `DROP DATABASE` for that database failed. ([Bug#26704](#))
- `DROP TABLE` for `INFORMATION_SCHEMA` tables produced an `Unknown table` error rather than the more appropriate `Access denied`. ([Bug#24062](#))
- `SELECT COUNT(DISTINCT)` was slow compared with `SELECT DISTINCT`. Now the server can use loose index scan for certain forms of aggregate functions that use `DISTINCT`. See [Section 7.13.10.1, “Loose Index Scan”](#). ([Bug#21849](#), [Bug#38213](#))
- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. ([Bug#18444](#))
- A `TABLE ... DOESN'T EXIST` error could occur for statements that called a function defined in another database. ([Bug#17199](#))

D.2. MySQL Enterprise Monitor Change History

This appendix lists the changes to the MySQL Enterprise Monitor, beginning with the most recent release. Each release section covers added or changed functionality, bug fixes, and known issues, if applicable. All bug fixes are referenced by bug number and include a link to the bug database. Bugs are listed in order of resolution. To find a bug quickly, search by bug number.

D.2.1. Changes in MySQL Enterprise Monitor 2.3.1 (15 December 2010)

Bugs fixed:

- Changing the frequency for the Heat Chart rule `MySQL Agent Not Reachable` to anything other than the default `00:01` caused the alert not to function. Now this rule cannot be changed to any different frequency. ([Bug#58018](#))
- If the proxy was not enabled in MySQL Enterprise Monitor 2.2, an upgrade to 2.3 could fail. ([Bug#57958](#))
- The `.log` and `.pid` files for the MySQL Enterprise Agent would be left behind after deinstalling the Agent. Now these files are removed. ([Bug#57845](#))
- The aggregator incorrectly reported the average execution time for the summary period, rather than the total execution time. ([Bug#57538](#))
- The `Manage Servers` tab now displays an operating system column that you can sort and filter. ([Bug#57517](#))

D.2.2. Changes in MySQL Enterprise Monitor 2.3.0 (1 November 2010)

Functionality added or changed:

- The new Aggregator component accepts Query Analyzer data from any source.
- There is a new advisor and corresponding graph for network and disk I/O.
- There is a new advisor and corresponding graph for InnoDB Plugin.
- There is a new advisor and corresponding graph for MySQL Cluster.
- The “What's New?” page integrates with My Oracle Support service, in addition to the MySQL Enterprise web site.
- There is no longer a requirement to enter a license key.
- Query Analyzer, Replication monitoring, and all rules and graphs are now available to all licensed users. See [ht-](#)

[tp://www.mysql.com/products/](http://www.mysql.com/products/) for details.

Bugs fixed:

- ([Bug#57126](#))
- The deprecated `--skip-locking` option for the embedded MySQL server was being used in place of the `-skip-external-locking` option. ([Bug#56004](#))
- The embedded OpenSSL has been updated to version 0.9.8o. ([Bug#55949](#))
- The data reported for the binary log file size (in `mysql::masterlogs::filesizesum`) was erroneously reporting the count of the files, not the sum of the size of the binary logs. ([Bug#54618](#))
- The list of active support issues on the **WHAT'S NEW** page has been updated to not show issues that are stale, and to not show issues if you have disabled the support issue checks. ([Bug#54600](#))
- Monitoring a database with a large number of tables would lead to long queries on `INFORMATION_SCHEMA` which could lead to operating system memory graphs not being updated correctly. ([Bug#54591](#))
- The MySQL Enterprise Agent installer would ask for agent credentials, even if you had indicated that the correct user credentials had already been created. ([Bug#53943](#))
- If the `config.properties` file, which can contain sensitive information, is world-readable, the server issues a warning message and does not start. ([Bug#53004](#))
- The timeout for information being supplied through the aggregator was too high, leading to a failure to identify that the aggregator was unavailable. ([Bug#52280](#))
- The installer dialog for the text installation for MySQL Enterprise Agent would show a blank password prompt when asking for confirmation of the root password. ([Bug#52129](#))
- With the setting `log-level=debug`, the JSON data in the Aggregator log is now formatted. ([Bug#49469](#))
- The file permissions on the `mysql` directory within the MySQL Enterprise Service Manager installation would not be set correctly on Mac OS X. ([Bug#35203](#))

D.3. MySQL Connector/ODBC (MyODBC) Change History

D.3.1. Changes in MySQL Connector/ODBC 5.1.9 (Not released yet)

This section has no changelog entries.

D.3.2. Changes in MySQL Connector/ODBC 5.1.8 (07 November 2010)

Functionality added or changed:

- Documentation in `.CHM` and `.HLP` format has been removed from the distribution. ([Bug#56232](#))

Bugs fixed:

- For some procedure and parameter combinations `SQLProcedureColumns()` did not work correctly. For example, it could not return records for an existing procedure with correct parameters supplied.
Further, it returned incorrect data for column 7, `TYPE_NAME`. For example, it returned `VARCHAR(20)` instead of `VARCHAR`. ([Bug#57182](#))
- The MySQL Connector/ODBC MSI installer did not set the `InstallLocation` value in the Microsoft Windows registry. ([Bug#56978](#))
- In bulk upload mode, `SQLExecute` would return `SQL_SUCCESS`, even when the uploaded data contained errors, such as primary key duplication, and foreign key violation. ([Bug#56804](#))
- `SQLDescribeCol` and `SQLColAttribute` could not be called before `SQLExecute`, if the query was parameterized and

not all parameters were bound.

Note, MSDN states that “For performance reasons, an application should not call `SQLColAttribute`/`SQLDescribeCol` before executing a statement.” However, it should still be possible to do so if performance reasons are not paramount. ([Bug#56717](#))

- When `SQLNumResultCols()` was called between `SQLPrepare()` and `SQLExecute()` the driver ran `SET @@sql_select_limit=1`, which limited the resultset to just one row. ([Bug#56677](#))
- After installing MySQL Connector/ODBC, the system DSN created could not be configured or deleted. An error dialog was displayed, showing the error message “Invalid attribute string”.

In this case the problem was due to the fact that the driver could not parse the NULL-separated connection string. ([Bug#56233](#))

- When used after a call to `SQLTables()`, `SQLRowCount()` did not return the correct value. ([Bug#55870](#))
- When attempting to install the latest Connector/ODBC 5.1.6 on Windows using the MSI, with an existing 5.1.x version already installed, the following error was generated:

```
Another version of this product is already installed. Installation of this version
cannot continue. To configure or remove the existing version of this product, use
Add/Remove Programs on the Control Panel.
```

Also, the version number displayed in the ODBC Data Source Administrator/Drivers tab did not get updated when removing or installing a new version of 5.1.x. ([Bug#54314](#))

D.3.3. Changes in MySQL Connector/ODBC 5.1.7 (24 August 2010)

Functionality added or changed:

- MySQL Connector/ODBC has been changed to support the `CLIENT_INTERACTIVE` flag. ([Bug#48603](#))

Bugs fixed:

- `SQLColAttribute(SQL_DESC_PRECISION...)` function returned incorrect results for type identifiers that have a negative value:

```
#define SQL_LONGVARCHAR      (-1) returned 4294967295
#define SQL_BINARY            (-2) returned 4294967294
#define SQL_VARBINARY         (-3) returned 4294967293
#define SQL_LONGVARBINARY     (-4) returned 4294967292
#define SQL_BIGINT             (-5) returned 4294967291
#define SQL_TINYINT            (-6) returned 4294967290
#define SQL_BIT                (-7) returned 4294967289
```

They were returned as 32-bit unsigned integer values. This only happened on 64-bit Linux. ([Bug#55024](#))

- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have included the null byte. ([Bug#54206](#))
- The `SQLColumns` function returned the incorrect transfer octet length into the column `BUFFER_LENGTH` for `DECIMAL` type. ([Bug#53235](#))
- `SQLForeignKeys()` did not return the correct information. The list of foreign keys in other tables should not have included foreign keys that point to unique constraints in the specified table. ([Bug#51422](#))
- In contrast to all other ODBC catalog functions `SQLTablePrivileges` required the user to have `SELECT` privilege on MySQL schemata, otherwise the function returned with an error:

```
SQL Error. Native Code: 1142, SQLState: HY000, Return Code: -1
[MySQL][ODBC 5.1 Driver][mysqld-5.0.67-community-nt]SELECT command denied to user
'repadmin'@'localhost' for table 'tables_priv'
[Error][SQL Error]Error executing SQLTablePrivileges for object cat: myrep, object Name:
xxxxxxxxxx
```

([Bug#50195](#))

- MySQL Connector/ODBC manually added a `LIMIT` clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the `LIMIT` clause. ([Bug#49726](#))

- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. ([Bug#49029](#))
- Bulk upload operations did not work for queries that used parameters. ([Bug#48310](#))
- Retrieval of the current catalog at the moment when a connection was not ready, such as when the connection had been broken or when not all pending results had been processed, resulted in the application crashing. ([Bug#46910](#))
- Describing a view or table caused SQLPrepare to prefetch table data. For large tables this created an intolerable performance hit. ([Bug#46411](#))
- If an application was invoked by the root user, `SQLDriverConnect()` was not able to use the username and password in the connection string to connect to the database. ([Bug#45378](#))
- Calling `SQLColAttribute` on a date column did not set `SQL_DESC_DATETIME_INTERVAL_CODE`. `SQLColAttribute` returned `SQL_SUCCESS` but the integer passed in was not set to `SQL_CODE_DATE`. ([Bug#44576](#))
- Conversions for many types were missing from the file `driver/info.c`. ([Bug#43855](#))
- The `SQLTables()` function required approximately two to four minutes to return the list of 400 tables in a database. The `SHOW TABLE STATUS` query used by `SQLTables()` was extremely slow for InnoDB tables with a large number of rows because the query was calculating the approximate number of rows in each table. Further, the results could not be cached due to non-deterministic nature of the result set (the row count was re-calculated every time), impacting performance further. ([Bug#43664](#))
- Executing `SQLForeignKeys` to get imported foreign keys for tables took an excessively long time. For example, getting imported foreign keys for 252 tables to determine parent/child dependencies took about 3 minutes and 14 seconds for the 5.1.5 driver, whereas it took 3 seconds for the 3.5x.x driver. ([Bug#39562](#))
- `SQLDescribeCol` returned incorrect column definitions for `SQLTables` result. ([Bug#37621](#))
- When opening `ADO.Recordset` from Microsoft Access 2003, a run-time error occurred:

```
ErrNo: -2147467259 ErrMessage: Data provider or other service returned an E_FAIL status.
```

([Bug#36996](#))
- `SQLPrimaryKeysW` returned mangled strings for table name, column name and primary key name. ([Bug#36441](#))
- On Windows, the SOCKET parameter to the DSN was used as the named pipe name to connect to. This was not exposed in the Windows setup GUI. ([Bug#34477](#))
- MySQL Connector/ODBC returned a value of zero for a column with a non-zero value. This happened when the column had a data type of `BIT`, and any numeric type was used in `SQLBindCol`. ([Bug#32821](#))
- Option for handling bad dates was not available in the GUI. ([Bug#30539](#))

D.3.4. Changes in MySQL Connector/ODBC 5.1.6 (09 November 2009)

Functionality added or changed:

- In the MySQL Data Source Configuration dialog, an excessive number of tabs were required to navigate to selection of a database. MySQL Connector/ODBC has been changed to make the tab order more practical, thereby enabling faster configuration of a Data Source. ([Bug#42905](#))

Bugs fixed:

- An error randomly occurred on Windows 2003 Servers (German language Version) serving classic ASP scripts on IIS6 MDAC version 2.8 SP2 on Windows 2003 SP2. The application connected to MySQL Server 5.0.44-log with a charset of UTF-8 Unicode (utf8). The MySQL server was running on Gentoo Linux.

The script error occurred sporadically on the following line of code:

```
SET my_conn = Server.CreateObject("ADODB.Connection")
my_conn.Open ConnString <- ERROR
```

The connection was either a DSN or the explicit connection string:

```
Driver={MySQL ODBC 5.1 Driver};SERVER=abc.abc.abc.abc;DATABASE=dbname;UID=uidname;PWD=pwdname;PORT=3306;OPTION=6710
```

The error occurred on connections established using either a DNS or a connection string.

When IISState and Debug Diagnostic Tool 1.0.0.152 was used to analyse the code, the following crash analysis was generated:

```
MYODBC5!UTF16TOUTF32+6In 4640-1242788336.dmp the assembly instruction at  
myodbc5!utf16toutf32+6 in C:\Programme\MySQL\Connector ODBC 5.1\myodbc5.dll from MySQL AB  
has caused an access violation exception (0xC0000005) when trying to read from memory  
location 0x194dd000 on thread 33
```

([Bug#44971](#))

- MySQL Connector/ODBC overwrote the query log. MySQL Connector/ODBC was changed to append the log, rather than overwrite it. ([Bug#44965](#))
- MySQL Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. ([Bug#42120](#))
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

`SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and “Table does not exist” message from MySQL Server. ([Bug#41946](#))

- Calling `SQLDescribeCol()` with a `NULL` buffer and nonzero buffer length caused a crash. ([Bug#41942](#))
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. ([Bug#41256](#))
- When a column of type `DECIMAL` containing `NULL` was accessed, MySQL Connector/ODBC returned a 0 rather than a `NULL`. ([Bug#41081](#))
- In Access 97, when linking a table containing a `LONGTEXT` or `TEXT` field to a MySQL Connector/ODBC DSN, the fields were shown as `TEXT(255)` in the table structure. Data was therefore truncated to 255 characters. ([Bug#40932](#))
- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

```
SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
```

([Bug#40316](#))

- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when the record set was updated with the `Update` method. ([Bug#39961](#))
- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. ([Bug#39957](#))
- MyODBC would crash when a character set was being used on the server that was not supported in the client, for example cp1251:

```
[MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
```

The fix causes MyODBC to return an error message instead of crashing. ([Bug#39831](#))

- Binding `SQL_C_BIT` to an `INTEGER` column did not work.

The `sql_get_data()` function only worked correctly for `BOOLEAN` columns that corresponded to `SQL_C_BIT` buffers. ([Bug#39644](#))

- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. ([Bug#39561](#))
- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. ([Bug#39560](#))
- MyODBC Driver 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as “`SERVER= localhost`” instead of “`SERVER=localhost`” the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host 'localhost' (11001).
```

([Bug#39085](#))

- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the NULL terminator. ([Bug#38949](#))
- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid nonnull string. ([Bug#37649](#))
- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. ([Bug#37278](#))
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. ([Bug#37179](#))
- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. ([Bug#36071](#))
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. ([Bug#30626](#))
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':  
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

([Bug#29955](#))

- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

([Bug#26950](#))

- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. ([Bug#17679](#))

D.3.5. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. ([Bug#37342](#))
- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. ([Bug#37254](#))
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. ([Bug#36293](#))
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. ([Bug#36275](#))
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. ([Bug#36203](#))
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. ([Bug#36069](#))

D.3.6. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. ([Bug#35920](#))
- The driver installer could not create a new DSN if many other drivers were already installed. ([Bug#35776](#))
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. ([Bug#33910](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))

D.3.7. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change:** You must uninstall previous 5.1.x editions of MySQL Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the certificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. ([Bug#34672](#))
- Installation of MySQL Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. ([Bug#34522](#))
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. ([Bug#34429](#))
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. ([Bug#34271](#))
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. ([Bug#33918](#))
- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the MySQL Connector/ODBC driver. ([Bug#33825](#))
- MySQL Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. ([Bug#33808](#))
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. ([Bug#24535](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))

D.3.8. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Explicit descriptors are implemented. ([Bug#32064](#))
- A full implementation of `SQLForeignKeys` based on the information available from `INFORMATION_SCHEMA` in 5.0 and later versions of the server has been implemented.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which enables more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. ([Bug#33897](#))
- Within the GUI interface, when connecting to a MySQL server on a nonstandard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. ([Bug#33822](#))
- Specifying a nonexistent database name within the GUI dialog would result in an empty list, not an error. ([Bug#33615](#))
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. ([Bug#33388](#))
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. ([Bug#33130](#))
- Retrieving data from a `BLOB` column would fail within `SQLGetData` when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. ([Bug#32684](#))
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. ([Bug#28617](#))
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. ([Bug#19923](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`

- [SQLDescribeCol](#)
- [SQLSpecialColumns](#) (theoretically can have the same problem) ([Bug#12805](#), [Bug#30890](#))
- Dynamic cursors on statements with parameters were not supported. ([Bug#11846](#))
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. ([Bug#10128](#))
- Adding or updating a row using [SQLSetPos\(\)](#) on a result set with aliased columns would fail. ([Bug#6157](#))

D.3.9. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from [Connector/ODBC 3.51.21](#) and [3.51.22](#).

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- **Incompatible Change:** Replaced myodbc3i (now myodbc-installer) with MySQL Connector/ODBC 5.0 version.
- **Incompatible Change:** Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change:** Do not permit `SET NAMES` in initial statement and in executed statements.
- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. ([Bug#32685](#))
- Added MSI installer for Windows 64-bit. ([Bug#31510](#))
- Implemented support for `SQLCancel()`. ([Bug#15601](#))
- Added support for `SQL_NUMERIC_STRUCT`. ([Bug#3028](#), [Bug#24920](#))
- Removed nonthreadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of MySQL Connector/ODBC 5.0, supports Unicode option values.
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. ([Bug#32596](#))
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. ([Bug#32161](#))
- ADO was unable to open record set using dynamic cursor. ([Bug#32014](#))
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. ([Bug#31720](#))
- Memory usage would increase considerably. ([Bug#31115](#))
- SQL statements are limited to 64KB. ([Bug#30983](#), [Bug#30984](#))
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. ([Bug#29765](#))
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. ([Bug#29239](#))
- ADO Not possible to update a client side cursor. ([Bug#27961](#))
- Recordset `Update()` fails when using `adUseClient` cursor. ([Bug#26985](#))
- MySQL Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semi-colon and other punctuation marks. ([Bug#16178](#))
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

D.3.10. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#).

Functionality added or changed:

- Added support for Unicode functions (`SQLConnectW`, etc).
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for `SQL_C_WCHAR`.

D.3.11. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

Note

Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1.

Bugs fixed:

- Inserting `NULL` values into a `DATETIME` column from Access reports an error. ([Bug#27896](#))
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. ([Bug#20127](#))

D.3.12. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. ([Bug#25316](#))
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. ([Bug#25263](#))
- Transaction support has been added and tested. ([Bug#25045](#))
- Internal function, `my_setpos_delete_ignore()` could cause a crash. ([Bug#22796](#))
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.
- Fixed the binding of certain integer types.

D.3.13. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. ([Bug#24876](#))
- Added initial unicode support in data and metadata. ([Bug#24837](#))
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. ([Bug#24485](#))
- Added loose handling of retrieving some diagnostic data. ([Bug#15782](#))
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. ([Bug#24675](#))
- String query parameters are now escaped correctly. ([Bug#19078](#))

D.3.14. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as SQL_NUMERIC_STRUCT.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.
- Added limit of display size when requested using `SQLColAttribute/SQL_DESC_DISPLAY_SIZE`.
- Fixed buffer length return for `SQLDriverConnect`.
- ODBC v2 behavior in driver now supports ODBC v3 date/time types (since `DriverManager` maps them).
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed `SQLGetData` to clear the NULL indicator correctly during multiple calls.

D.3.15. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.
- Fixed display size to be length if max length isn't available.
- Made distinction between `CHAR/BINARY` (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using `SQL_C_LONG`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Allow `SQLDescribeCol` to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS

Access.

- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed handling of numeric pointers in SQLColAttribute.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by `SQLGetDiagRec`.

D.3.16. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for `SQLStatistics` to `MYODBCShell`.
- Improved trace/log.

Bugs fixed:

- `SQLBindParameter` now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

D.3.17. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations, and notes on this release

- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.
- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

D.3.18. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

D.3.19. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
 - [SQLBindParameter](#)
 - [SQLBindCol](#)

D.3.20. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

D.3.21. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
 - [SQLAllocHandle](#)
 - [SQLCloseCursor](#)
 - [SQLColAttribute](#)
 - [SQLColumns](#)
 - [SQLConnect](#)
 - [SQLCopyDesc](#)
 - [SQLDisconnect](#)
 - [SQLExecDirect](#)
 - [SQLExecute](#)
 - [SQLFetch](#)
 - [SQLFreeHandle](#)
 - [SQLFreeStmt](#)
 - [SQLGetConnectAttr](#)
 - [SQLGetData](#)
 - [SQLGetDescField](#)

- [SQLGetDescRec](#)
- [SQLGetDiagField](#)
- [SQLGetDiagRec](#)
- [SQLGetEnvAttr](#)
- [SQLGetFunctions](#)
- [SQLGetStmtAttr](#)
- [SQLGetTypeInfo](#)
- [SQLNumResultCols](#)
- [SQLPrepare](#)
- [SQLRowcount](#)
- [SQLTables](#)

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- [SQLSetConnectAttr](#)
- [SQLSetDescField](#)
- [SQLSetDescRec](#)
- [SQLSetEnvAttr](#)
- [SQLSetStmtAttr](#)

D.3.22. Changes in MySQL Connector/ODBC 3.51.28 (Not yet released)

Bugs fixed:

- [SQLColAttribute\(...SQL_DESC_CASE_SENSITIVE...\) returned SQL_FALSE for binary types and SQL_TRUE for the rest. It should have returned SQL_TRUE for binary types, and SQL_FALSE for the rest.](#) ([Bug#54212](#))
- [SQLColAttribute for SQL_DESC_OCTET_LENGTH returned length including terminating null byte. It should not have included the null byte.](#) ([Bug#54206](#))
- If NO_BACKSLASH_ESCAPES mode was used on a server, escaping binary data led to server query parsing errors. ([Bug#49029](#))
- Inserting a new record using [SQLSetPos](#) did not correspond to the database name specified in the [SELECT](#) statement when querying tables from databases other than the current one.

[SQLSetPos](#) attempted to do the [INSERT](#) in the current database, but finished with a [SQL_ERROR](#) result and “Table does not exist” message from MySQL Server. ([Bug#41946](#))
- No result record was returned for [SQLGetTypeInfo](#) for the [TIMESTAMP](#) data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. ([Bug#30626](#))
- Microsoft Access was not able to read [BIGINT](#) values properly from a table with just two columns of type [BIGINT](#) and [VARCHAR](#). `#DELETE` appeared instead of the correct values. ([Bug#17679](#))

D.3.23. Changes in MySQL Connector/ODBC 3.51.27 (20 November 2008)

Bugs fixed:

- The client program hung when the network connection to the server was interrupted. ([Bug#40407](#))
- The connection string option [Enable Auto-reconnect](#) did not work. When the connection failed, it could not be restored,

and the errors generated were the same as if the option had not been selected. ([Bug#37179](#))

- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':
[MySQL][ODBC 3.51 Driver]SSL connection error.
```

([Bug#29955](#))

D.3.24. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. ([Bug#29402](#))

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. ([Bug#30770](#))
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. ([Bug#24131](#))

D.3.25. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem)
([Bug#12805](#), [Bug#30890](#))

D.3.26. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement:** Accessing a parameter with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stropped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. ([Bug#34575](#))
- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the certificate of certificates. To enforce verification of the

- SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))
- When using ADO, the count of parameters in a query would always return zero. ([Bug#33298](#))
 - Using tables with a single quote or other nonstandard characters in the table or column names through ODBC would fail. ([Bug#32989](#))
 - When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. ([Bug#32864](#))
 - `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. ([Bug#32420](#))
 - When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. ([Bug#31959](#))
 - When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

Note

ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

([Bug#31495](#))

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. ([Bug#31220](#))
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). ([Bug#29871](#))
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. ([Bug#27351](#))
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. ([Bug#27158](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))
- With some connections to MySQL databases using MySQL Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. ([Bug#16653](#))

D.3.27. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- MySQL Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. ([Bug#32727](#))
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. ([Bug#32587](#))
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. ([Bug#32366](#))
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the er-

ror `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. ([Bug#3780](#))

D.3.28. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

This regression was introduced by [Bug#10491](#).

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. ([Bug#32294](#))
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. ([Bug#32253](#))
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. ([Bug#32171](#))
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. ([Bug#30958](#))
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. ([Bug#13776](#))

D.3.29. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. ([Bug#31246](#))
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. ([Bug#31055](#))
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. ([Bug#31009](#))
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). ([Bug#30939](#))
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. ([Bug#30568](#))
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. ([Bug#30499](#))
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). ([Bug#29871](#))
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column permitted `NULL` values. This was due to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. ([Bug#26108](#))
- MySQL Connector/ODBC would return the wrong error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. MySQL Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. ([Bug#3456](#))

D.3.30. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. ([Bug#30840](#))

- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. ([Bug#30774](#))
- The wrong column size was returned for binary data. ([Bug#30547](#))
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. ([Bug#30520](#))
- `SQLGetConnectAttr()` did not reflect the connection state correctly. ([Bug#14639](#))
- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

D.3.31. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see [Section D.3.32, “Changes in MySQL Connector/ODBC 3.51.18 \(08 August 2007\)”.](#)

Functionality added or changed:

- Because of [Bug#10491](#) in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

D.3.32. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change:** The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the `mysql` database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. ([Bug#28662](#))
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the MySQL Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would be installed local to the user, not globally. ([Bug#15326](#), [Bug#10444](#))
- MySQL Connector/ODBC now supports batched statements. To enable cached statement support, you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or `ALLOW MULTIPLE STATEMENTS` within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. ([Bug#7445](#))
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. ([Bug#6741](#))
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not

be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns . ([Bug#9927](#)) ([Bug#30081](#))

- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. ([Bug#29964](#))
- Getting table metadata (through the `SQLColumns()`) would fail, returning a bad table definition to calling applications. ([Bug#29888](#))
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. ([Bug#28657](#))
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. ([Bug#27862](#))
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. ([Bug#19345](#))
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. ([Bug#14414](#))
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. ([Bug#14407](#))
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in `SQLColumns()` was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

D.3.33. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.

- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. ([Bug#9498](#), [Bug#6667](#))
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling `SQLGetData()` if value is null. Now returns `SQL_ERROR` w/state 22002.
- The setup library has been split into its own RPM package, to enable installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. ([Bug#29709](#))
- MySQL Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. ([Bug#28316](#))
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. ([Bug#27315](#))
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. ([Bug#26934](#))
- For a stored procedure that returns multiple result sets, MySQL Connector/ODBC returned only the first result set. ([Bug#16817](#))
- Calling `SQLGetDiagField` with `RecNumber 0, DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. ([Bug#16224](#))
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum permitted ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. ([Bug#13766](#))
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. ([Bug#10563](#))
- When inserting a large `BLOB` field, MySQL Connector/ODBC would crash due to a memory allocation error. ([Bug#10562](#))
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. ([Bug#9498](#))
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained nonalphanumeric characters. ([Bug#8860](#))
- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

D.3.34. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- MySQL Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. ([Bug#12918](#))

Bugs fixed:

- Calls to SQLNativeSql() could cause stack corruption due to an incorrect pointer cast. ([Bug#28758](#))
- Using cursors on results sets with multi-column keys could select the wrong value. ([Bug#28255](#))
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. ([Bug#27723](#))
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. ([Bug#27544](#))
- `SQLTables()` did not distinguish tables from views. ([Bug#23031](#))
- Data in `TEXT` columns would fail to be read correctly. ([Bug#16917](#))
- Specifying strings as parameters using the `adBSTR` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. ([Bug#16235](#))
- `SQL_WVARCHAR` and `SQL_WLONGVARCHAR` parameters were not properly quoted and escaped. ([Bug#16235](#))
- Using `BETWEEN` with date values, the wrong results could be returned. ([Bug#15773](#))
- When using the `Don't Cache Results` (option value [1048576](#)) with Microsoft Access, the connection will fail using DAO/VisualBasic. ([Bug#4657](#))
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

D.3.35. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- MySQL Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. ([Bug#27591](#))
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. ([Bug#27589](#))
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. ([Bug#27220](#))
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. ([Bug#24306](#))
- Using `SQLProcedures` does not return the database name within the returned resultset. ([Bug#23033](#))
- The `SQLTransact()` function did not support an empty connection handle. ([Bug#21588](#))
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. ([Bug#7912](#))
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. ([Bug#5853](#))
- MySQL Connector/ODBC would return too many foreign key results when accessing tables with similar names. ([Bug#4518](#))

D.3.36. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported.` ([Bug#19823](#))

- Added auto is null option to MySQL Connector/ODBC option parameters. ([Bug#10910](#))
- Added auto-reconnect option to MySQL Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. ([Bug#26024](#))
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. ([Bug#25846](#))
- MySQL Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. ([Bug#22446](#))
- Using MySQL Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](#))
- Using `DataAdapter`, MySQL Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). ([Bug#20459](#))
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. ([Bug#20208](#))
- The ODBC driver name and version number were incorrectly reported by the driver. ([Bug#19740](#))
- A string format exception would be raised when using iODBC, MySQL Connector/ODBC and the embedded MySQL server. ([Bug#16535](#))
- The `SQLDriverConnect()` ODBC method did not work with recent MySQL Connector/ODBC releases. ([Bug#12393](#))

D.3.37. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

This section has no changelog entries.

D.3.38. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. ([Bug#15635](#))
- File DSNs could not be saved. ([Bug#12019](#))
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#))

D.3.39. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#))
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#))

D.4. MySQL Connector/.NET Change History

D.4.1. Changes in MySQL Connector/.NET Version 6.4.x

D.4.1.1. Changes in MySQL Connector/.NET 6.4.1 (Not yet released Alpha)

First alpha.

Functionality added or changed:

- Changed how the procedure schema collection is retrieved. If the connection string contains “`use procedure bodies=true`” then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains “`use procedure bodies=false`”, then the Information Schema collection is queried. ([Bug#36694](#))

D.4.2. Changes in MySQL Connector/.NET Version 6.3.x

D.4.2.1. Changes in MySQL Connector/.NET 6.3.7 (Not yet released GA)

Fourth GA release. Fixes bugs since 6.3.6.

Bugs fixed:

- The setup wizard failed with the error “Setup Wizard ended prematurely because of an error”. This was because it assumed .NET Framework version 4.0 was located on the C: drive, when it was actually located on the E: drive. ([Bug#59301](#))

D.4.2.2. Changes in MySQL Connector/.NET 6.3.6 (03 January 2011 GA)

Third GA release. Fixes bugs since 6.3.5.

Functionality added or changed:

- Changed how the procedure schema collection is retrieved. If the connection string contains “`use procedure bodies=true`” then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains “`use procedure bodies=false`”, then the Information Schema collection is queried. ([Bug#36694](#))

Bugs fixed:

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. ([Bug#58906](#))
- Code introduced to fix [Bug#54863](#) proved problematic on .NET version 3.5 and above. ([Bug#58853](#))
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

The variable `token` was not used anywhere in the code. ([Bug#58757](#))

- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. ([Bug#58652](#))
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. ([Bug#58373](#))
- When attempting to create an ADO.NET Entity Data Model, MySQL connections were not available. ([Bug#58278](#))
- MySQL Connector/.NET did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. ([Bug#58244](#))
- Installation of MySQL Connector/.NET 6.3.5 failed. The error reported was:

```
MySQL Connector Net 6.3.5 Setup Wizard ended  
prematurely because of an error. Your system has not been modified.
```

([Bug#57654](#))

- When the tracing driver was used and a SQL statement was longer than 300 characters, an `ArgumentOutOfRangeException` occurred if the statement also contained a quoted character, and the 300th character was in the middle of a quoted token. ([Bug#57641](#))
- Calling the `Read()` method on a `DataReader` obtained from `MySqlHelper.ExecuteReader` generated the following exception:

```
Unhandled Exception: MySql.Data.MySqlClient.MySqlException: Invalid attempt to R  
ead when reader is closed.  
   at MySql.Data.MySqlClient.MySqlDataReader.Read()  
   at MySqlTest.MainClass.Main(String[] args)
```

([Bug#57501](#))

- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. ([Bug#56509](#))
- When using MySQL Connector/NET on Mono 2.8 using .NET 4.0, attempting to connect to a MySQL database generated the following exception:

```
Unhandled Exception: System.MissingMethodException: Method not found:  
'System.Data.Common.DbConnection.EnlistTransaction'.  
   at (wrapper remoting-invoke-with-check)  
MySql.Data.MySqlClient.MySqlConnection:Open ()
```

([Bug#56509](#))

- MySQL Connector/NET for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. ([Bug#56410](#))
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. ([Bug#55349](#))

D.4.2.3. Changes in MySQL Connector/NET 6.3.5 (12 October 2010 GA)

Second GA release. Fixes bugs since 6.3.4.

Bugs fixed:

- Setting `SqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. ([Bug#57265](#))
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. ([Bug#57092](#))
- MySQL Connector/NET experienced two problems as follows:
 - A call to `System.Data.Objects.ObjectContext.DatabaseExists()` returned false, even if the database existed.
 - A call to `System.Data.Objects.ObjectContext.CreateDatabase()` created a database but with a name other than the one specified in the connection string. It then failed to use it when EDM objects were processed. ([Bug#56859](#))
- Setting the `Default Command Timeout` connection string option had no effect. ([Bug#56806](#))
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. ([Bug#56756](#))
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. ([Bug#56755](#))
- MySQL Connector/NET 6.1.3 (GA) would not install on a Windows Server 2008 (Web Edition) clean installation. There were two problems:

- If .NET framework version 4.0 was not installed, installation failed because c:\windows\microsoft.net\v4.0.* did not exist.
- If .NET 4.0 was subsequently installed, then the following error was generated:

```
InstallFiles: File: MySql.Data.Entity.dll, Directory: , Size: 229888
MSI (s) (E0:AC) [15:20:26:196]: Assembly Error:The assembly is built by a runtime newer
than the currently loaded runtime, and cannot be loaded.
MSI (s) (E0:AC) [15:20:26:196]: Note: 1: 1935 2: 3: 0x8013101B 4: IStream 5: Commit 6:
MSI (s) (E0:A0) [15:20:26:196]: Note: 1: 1304 2: MySql.Data.Entity.dll
Error 1304. Error writing to file: MySql.Data.Entity.dll. Verify that you have access to
that directory.
```

[\(Bug#56580\)](#)

D.4.2.4. Changes in MySQL Connector/NET 6.3.4 (01 September 2010 GA)

First GA release. Fixes bugs since 6.3.3.

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. ([Bug#55701](#))
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.
--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySQLClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySQLClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySQLClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySQLClient.MySQLDataReader.Read()
```

[\(Bug#55644\)](#)

- Calling `MySqlDataAdapter.Update(DataTable)` resulted in an unacceptable performance hit when updating large amounts of data. ([Bug#55609](#))
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

[\(Bug#55170\)](#)

- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))
- When attempting to carry out an operation such as:

```
from p in db.Products where p.PostedDate>=DateTime.Now select p;
```

Where `p.PostedDate` is a `DateTimeOffset`, and the underlying column type is a `TIMESTAMP`, the following exception was generated:

```
MySqlException occurred
Unable to serialize date/time value
```

MySQL Connector/NET has now been changed so that all `TIMESTAMP` columns will be surfaced as `DateTime`. ([Bug#52550](#))

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))

- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))

D.4.2.5. Changes in MySQL Connector/NET 6.3.3 (27 July 2010 beta)

Second Beta release. Fixes bugs since 6.3.2.

Bugs fixed:

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- MySQL Connector/NET generated a null reference exception when `TransactionScope` was used by multiple threads. ([Bug#54681](#))
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. ([Bug#54571](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. ([Bug#54152](#), [Bug#53865](#))
- MySQL Connector/NET did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. ([Bug#54012](#))
- MySQL Connector/NET 6.3.2 failed to install on Windows Vista. ([Bug#53975](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

([Bug#53457](#))

- MySQL Connector/NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. ([Bug#53439](#))
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
    MySql.Data.MySqlCommand.CheckState() +278
    MySql.Data.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
    MySql.Data.MySqlCommand.ExecuteReader() +6
    Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
    Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
    Forecast.Page_Load(Object sender, EventArgs e) in ...:70
    System.Web.UI.Control.OnLoad(EventArgs e) +99
    System.Web.UI.Control.LoadRecursive() +50
    System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

([Bug#53357](#))

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- The MySQL Connector/NET installation failed due to `machine.config` files not being present in configuration folders.

MySQL Connector/.NET has been changed to skip over configuration folders that do not contain a `machine.config` file. ([Bug#52352](#))

- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. ([Bug#52085](#))
- When an application was subjected to increased concurrent load, MySQL Connector/.NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'  
already belongs to this DataSet.
```

([Bug#49118](#))

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/.NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

D.4.2.6. Changes in MySQL Connector/.NET 6.3.2 (24 May 2010 beta)

First Beta release. Fixes bugs since 6.3.1.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

MySQL Connector/.NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))

- MySQL Connector/.NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message “There is already an open DataReader associated with this Connection which must be closed first.” ([Bug#55558](#))
- MySQL Connector/.NET generated an exception when used to read a `TEXT` column containing more than 32767 bytes. ([Bug#54040](#))
- In MySQL Connector/.NET, the `SqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))
- The procedure cache affected the MySQL Connector/.NET performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. ([Bug#52475](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- In MySQL Connector/.NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.  
Parameter name: length
```

([Bug#51610](#))

- MySQL Connector/.NET 6.3.1 failed to install. ([Bug#51407](#), [Bug#51604](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))

D.4.2.7. Changes in MySQL Connector/.NET 6.3.1 (02 March 2010 alpha)

Fixes bugs since 6.3.0.

Functionality added or changed:

- Connector/.NET was not compatible with Visual Studio wizards that used square brackets to delimit symbols. Connector/.NET has been changed to include a new connection string option `Sql Server mode` that supports use of square brackets to delimit symbols. ([Bug#35852](#))

Bugs fixed:

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

([Bug#51209](#))

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))
- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))
- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
MySql.Data.MySqlClient.MySqlException was unhandled  
Message="You have an error in your SQL syntax; check the manual that corresponds to your  
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"  
Source="MySql.Data"  
ErrorCode=-2147467259  
Number=1064  
StackTrace:  
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()  
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&  
lastInsertId)  
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()  
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
```

```
    à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
    à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
    à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
    à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

D.4.2.8. Changes in MySQL Connector/NET 6.3.0 (16 February 2010 alpha)

First alpha release of 6.3.

Functionality added or changed:

- Nested transaction scopes were not supported. MySQL Connector/NET now implements nested transaction scopes. A per-thread stack of scopes is maintained, which is necessary to handle nested scopes with the `RequiresNew` or `Suppress` options. ([Bug#45098](#))
- Support for MySQL Server 4.1 has been removed from MySQL Connector/NET starting with version 6.3.0. The connector will now throw an exception if you try to connect to a server of version less than 5.0.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. ([Bug#48944](#))
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))

D.4.3. Changes in MySQL Connector/NET Version 6.2.x

D.4.3.1. Changes in MySQL Connector/NET 6.2.5 (Not yet released GA)

This release fixes bugs since 6.2.4.

Bugs fixed:

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. ([Bug#58906](#))
- Code introduced to fix [Bug#54863](#) proved problematic on .NET version 3.5 and above. ([Bug#58853](#))
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

The variable `token` was not used anywhere in the code. ([Bug#58757](#))

- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. ([Bug#58652](#))
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. ([Bug#58373](#))

- MySQL Connector/.NET did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. ([Bug#58244](#))
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. ([Bug#57265](#))
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. ([Bug#57092](#))
- Setting the `Default Command Timeout` connection string option had no effect. ([Bug#56806](#))
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. ([Bug#56756](#))
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. ([Bug#56755](#))
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. ([Bug#56509](#))
- MySQL Connector/.NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. ([Bug#56410](#))
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. ([Bug#55349](#))

D.4.3.2. Changes in MySQL Connector/.NET 6.2.4 (30 August 2010 GA)

This release fixes bugs since 6.2.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.
MySQL Connector/.NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. ([Bug#55701](#))
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.
--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field, IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

([Bug#55644](#))

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message “There is already an open DataReader associated with this Connection which must be closed first.” ([Bug#55558](#))
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

[\(Bug#55170\)](#)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. ([Bug#54571](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. ([Bug#54152](#), [Bug#53865](#))
- MySQL Connector/.NET did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. ([Bug#54012](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.  
 MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,  
 Int32 count)  
 MySql.Data.MySqlClient.MySqlStream.LoadPacket()  
 Outer Exception Reading from the stream has failed.  
 ...
```

[\(Bug#53457\)](#)

- MySQL Connector/.NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. ([Bug#53439](#))
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this  
 Connection which must be closed first.]  
 MySql.Data.MySqlClient.MySqlCommand.CheckState() +278  
 MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43  
 MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6  
 Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323  
 Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)  
 in ...:13  
 Forecast.Page_Load(Object sender, EventArgs e) in ...:70  
 System.Web.UI.Control.OnLoad(EventArgs e) +99  
 System.Web.UI.Control.LoadRecursive() +50  
 System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean  
 includeStagesAfterAsyncPoint) +627
```

[\(Bug#53357\)](#)

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- In MySQL Connector/.NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))
- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))
- The procedure cache affected the MySQL Connector/.NET performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. ([Bug#52475](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- Periodically the session provider threw an `SqlNullValueException` exception. When this happened, the row within the `my_aspnet_sessions` table had `locked` always set to '1'. The locked status never changed back to '0' and the user experienced the exception on every page, until their browser was closed and reopened (recreating a new sessionID), or the `locked`

value was manually changed to '0'. ([Bug#52175](#))

- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. ([Bug#52085](#))
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named '\Procedure Parameters\'  
already belongs to this DataSet.
```

([Bug#49118](#))

- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

D.4.3.3. Changes in MySQL Connector/NET 6.2.3 (10 April 2010 GA)

This release fixes bugs since 6.2.2.

Functionality added or changed:

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.  
Parameter name: length
```

(Bug#51610)

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

(Bug#51209)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))

- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))

- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

(Bug#50344)

- When using the Compact Framework the following exception occurred when attempting to connect to a MySQL Server:

```
System.InvalidOperationException was unhandled
Message="Timeouts are not supported on this stream."
```

(Bug#50321)

- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))
- `MySqlDataReader.GetInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. ([Bug#49794](#))
- A `FormatException` was generated when an empty string was returned from a stored function. ([Bug#49642](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
 MySql.Data.MySqlClient.MySqlException was unhandled
 Message="You have an error in your SQL syntax; check the manual that corresponds to your
 MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
 Source="MySql.Data"
 ErrorCode=-2147467259
 Number=1064
 StackTrace:
   à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
   à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
 lastInsertId)
   à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
   à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
   à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
   à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
   à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
   à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. ([Bug#45277](#))
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

D.4.3.4. Changes in MySQL Connector/.NET 6.2.2 (22 December 2009 GA)

First GA release of 6.2. This release fixes bugs since 6.2.1.

Bugs fixed:

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. ([Bug#48944](#))
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))
- MySQL Connector/.NET generated an invalid operation exception during a transaction rollback:

```
System.InvalidOperationException: Connection must be valid and open to rollback
transaction
  at MySql.Data.MySqlClient.MySqlTransaction.Rollback()
  at MySql.Data.MySqlClient.MySqlConnection.CloseFully()
  at
MySql.Data.MySqlClient.MySqlPromotableTransaction.System.Transactions.IPromotableSinglePhaseNotification.Rollback(S
inglePhaseEnlistment)
...
```

([Bug#35330](#))

- Connection objects were not garbage collected when not in use. ([Bug#31996](#))

D.4.3.5. Changes in MySQL Connector/.NET 6.2.1 (16 November 2009 beta)

This release fixes bugs since 6.2.0.

Functionality added or changed:

- The `MySqlParameter` class now has a property named `PossibleValues`. This property is NULL unless the parameter is created by `MySqlCommandBuilder.DeriveParameters`. Further, it will be NULL unless the parameter is of type enum or set - in this case it will be a list of strings that are the possible values for the column. This feature is designed as an aid to the developer. ([Bug#48586](#))
- Prior to MySQL Connector/.NET 6.2, `MySqlCommand.CommandTimeout` included user processing time, that is processing time not related to direct use of the connector. Timeout was implemented through a .NET Timer, that triggered after `CommandTimeout` seconds.

MySQL Connector/.NET 6.2 introduced timeouts that are aligned with how Microsoft handles `SqlCommand.CommandTimeout`. This property is the cumulative timeout for all network reads and writes during command execution or processing of the results. A timeout can still occur in the `MySqlReader.Read` method after the first row is returned, and does not include user processing time, only IO operations.

Further details on this can be found in the relevant [Microsoft documentation](#).

- Starting with MySQL Connector/.NET 6.2, there is a background job that runs every three minutes and removes connections from pool that have been idle (unused) for more than three minutes. The pool cleanup frees resources on both client and server side. This is because on the client side every connection uses a socket, and on the server side every connection uses a socket and a thread.

Prior to this change, connections were never removed from the pool, and the pool always contained the peak number of open connections. For example, a web application that peaked at 1000 concurrent database connections would consume 1000 threads and 1000 open sockets at the server, without ever freeing up those resources from the connection pool.

- MySQL Connector/.NET now supports the processing of certificates when connecting to an SSL-enabled MySQL Server. For further information see the connection string option SSL Mode in the section [Section 22.2.6, “Connector/.NET Connection String Options Reference”](#) and the tutorial [Section 22.2.4.7, “Tutorial: Using SSL with MySQL Connector/.NET”](#).

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/.NET was changed so that it was possible to do:

```
MySqlCommand clone = comm.Clone();
```

([Bug#48460](#))

- When used, the `Encrypt` connection string option caused a “Keyword not supported” exception to be generated.

This option is in fact obsolete, and the option SSL Mode should be used instead. Although the `Encrypt` option has been fixed so that it does not generate an exception, it will be removed completely in version 6.4. ([Bug#48290](#))

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. ([Bug#48271](#))

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

MySQL Connector/.NET was changed to expose the `MySqlDecimal` type, along with the supporting method `Get MySqlDecimal`. ([Bug#48100](#))

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. ([Bug#47872](#))
- MySQL Connector/.NET session support did not work with MySQL Server versions prior to 5.0, as the Session Provider used a call to `TIMESTAMPDIFF`, which was not available on servers prior to 5.0. ([Bug#47219](#))

D.4.3.6. Changes in MySQL Connector/.NET 6.2.0 (21 October 2009 alpha)

The first alpha release of 6.2.

Bugs fixed:

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

([Bug#47928](#))

- The Session Provider created invalid “session expires” on a random basis.

This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. ([Bug#47815](#))

- When loading the `MySQLClient-mono.sln` file included with the Connector/.NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):  
Unsupported or unrecognized project:  
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):  
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an  
override but no suitable property found to override
```

(Bug#47048)

D.4.4. Changes in MySQL Connector/NET Version 6.1.x

D.4.4.1. Changes in MySQL Connector/NET 6.1.6 (Not yet released GA)

This release fixes bugs since 6.1.5.

Bugs fixed:

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. (Bug#58906)
- Code introduced to fix Bug#54863 proved problematic on .NET version 3.5 and above. (Bug#58853)
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

The variable `token` was not used anywhere in the code. (Bug#58757)

- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. (Bug#58652)
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. (Bug#58373)
- MySQL Connector/NET did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. (Bug#58244)
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug#57265)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug#57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug#56806)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug#56756)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug#56755)
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. (Bug#56509)
- MySQL Connector/NET for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. (Bug#56410)
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. (Bug#5349)

D.4.4.2. Changes in MySQL Connector/NET 6.1.5 (30 August 2010 GA)

This release fixes bugs since 6.1.4.

Bugs fixed:

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug#55701)
- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.  
--OverflowException
```

```
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMyValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMyValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

([Bug#55644](#))

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

([Bug#55170](#))

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `datadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. ([Bug#54571](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpa-ter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOut-OfRangeException`. ([Bug#54152](#), [Bug#53865](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

([Bug#53457](#))

- MySQL Connector/.NET did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. ([Bug#53439](#))
- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
    MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
    MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
    MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
    Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
    Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
    Forecast.Page_Load(Object sender, EventArgs e) in ...:70
    System.Web.UI.Control.OnLoad(EventArgs e) +99
    System.Web.UI.Control.LoadRecursive() +50
    System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

([Bug#53357](#))

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))

- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. ([Bug#52085](#))
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- When an application was subjected to increased concurrent load, MySQL Connector/NET generated the following error when calling stored procedures:

```
A DataTable named '\Procedure Parameters\'  
already belongs to this DataSet.
```

([Bug#49118](#))

- The `INSERT` command was significantly slower with MySQL Connector/NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

D.4.4.3. Changes in MySQL Connector/NET 6.1.4 (28 April 2010 GA)

This release fixes bugs since 6.1.3.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

MySQL Connector/NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))

- MySQL Connector/NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.  
Parameter name: length
```

([Bug#51610](#))

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))
- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

([Bug#50344](#))

- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))
- `MySqlDataReader.GetInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. ([Bug#49794](#))
- A `FormatException` was generated when an empty string was returned from a stored function. ([Bug#49642](#))
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. ([Bug#48944](#))
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
 MySql.Data.MySqlClient.MySqlException was unhandled  
Message="You have an error in your SQL syntax; check the manual that corresponds to your  
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"  
Source=" MySql.Data"  
ErrorCode=-2147467259  
Number=1064  
StackTrace:  
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()  
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&  
lastInsertId)  
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()  
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()  
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)  
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()  
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()  
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a [NullReferenceException](#). ([Bug#45277](#))
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

D.4.4.4. Changes in MySQL Connector/.NET 6.1.3 (16 November 2009 GA)

This release fixes bugs since 6.1.2.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/.NET was changed so that it was possible to do:

```
MySqlCommand clone = comm.Clone();
```

([Bug#48460](#))

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. ([Bug#48271](#))

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named "b`a`d" as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
    "Indexes",
    new string[] { null, schemaName, "b`a`d" });
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'a`d' at line 1
```

([Bug#48101](#))

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

MySQL Connector/.NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. ([Bug#48100](#))

- For some character sets such as UTF-8, a `CHAR` column would sometimes be incorrectly interpreted as a `GUID` by MySQL Connector/.NET.

MySQL Connector/.NET was changed so that a column would only be interpreted as a `GUID` if it had a character length of 36, as opposed to a byte length of 36. ([Bug#47985](#))

- When using a `BINARY(16)` column to represent a GUID and having specified "old guid = true" in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

([Bug#47928](#))

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. ([Bug#47872](#))

- The Session Provider created invalid “session expires” on a random basis.

This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. ([Bug#47815](#))

- Attempting to build MySQL Connector/.NET 6.1 `MySQL.Data` from source code on Windows failed with the following error:

```
...\\clones\\6.1\\MySQL.Data\\Provider\\Source\\NativeDriver.cs(519,29): error CS0122:  
' MySql.Data.MySqlClient.MySqlPacket' is inaccessible due to its protection level
```

([Bug#47354](#))

- When tables were auto created for the Session State Provider they were set to use the MySQL Server's default collation, rather than the default collation set for the containing database. ([Bug#47332](#))
- When loading the `MySQLClient-mono.sln` file included with the Connector/.NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):  
Unsupported or unrecognized project:  
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySQL.Data/Provider/Source/Connection.cs(280,46):  
error CS0115: ` MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory` is marked as an  
override but no suitable property found to override
```

([Bug#47048](#))

D.4.4.5. Changes in MySQL Connector/.NET 6.1.2 (08 September 2009 GA)

This is the first GA release of 6.1.

Bugs fixed:

- The MySQL Connector/.NET Session State Provider truncated session data to 64KB, due to its column types being set to `BLOB`. ([Bug#47339](#))
- MySQL Connector/.NET generated the following exception when using the Session State provider:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL  
server version for the right syntax to use near 'MINUTEWHERE SessionId =  
'dtmgga55x35oi255nrfrxe45' AND ApplicationId = 1 AND Loc' at line 1  
Description: An unhandled exception occurred during the execution of the current web  
request. Please review the stack trace for more information about the error and where it  
originated in the code.
```

```
Exception Details: MySql.Data.MySqlClient.MySqlException: You have an error in your SQL  
syntax; check the manual that corresponds to your MySQL server version for the right  
syntax to use near 'MINUTEWHERE SessionId = 'dtmgga55x35oi255nrfrxe45' AND ApplicationId =  
1 AND Loc' at line 1
```

([Bug#46939](#))

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

This was due to the fact that the encoding field had not been initialized correctly. ([Bug#46844](#))

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. ([Bug#44985](#))
- MySQL Connector/.NET did not time out correctly. The command timeout was set to 30 secs, but MySQL Connector/.NET hung for several hours. ([Bug#43761](#))

D.4.4.6. Changes in MySQL Connector/NET 6.1.1 (20 August 2009 beta)

This is the first Beta release of 6.1.

Bugs fixed:

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. ([Bug#46620](#))
- The MySQL Connector/NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application
-----
The requested feature is not implemented.
Description: HTTP 500. Error processing request.

Stack Trace:

System.NotImplementedException: The requested feature is not implemented.
at MySql.Data.MySqlClient.MySqlConnection.EnlistTransaction
(System.Transactions.Transaction transaction) [0x00000]

-----
Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

([Bug#46375](#))

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. ([Bug#46311](#))
- MySQL Connector/NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. ([Bug#46308](#))
- When using MySQL Connector/NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException' System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column. Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

([Bug#46270](#))

- The MySQL Connector/NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message "Parameter 'foo' not found in the collection." and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(str
ing parameterName = "pStart", bool throwOnNotFound = true) Line 459C#

System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
0x5f bytes
```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. ([Bug#46205](#), [Bug#46359](#), [Bug#41953](#))
- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
SystemArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.
```

(Bug#46100)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

This resulted in the data being unsorted. ([Bug#45723](#))

- The MySQL Connector/NET 6.0.4 installer failed with an error. The error message generated was:

```
There is a problem with this Windows Installer package. A DLL required for this
install to complete could not be run. Contact your support personnel or package vendor.
```

When OK was clicked to acknowledge the error the installer exited. ([Bug#45474](#))

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

(Bug#45457)

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
The value given is not an instance of type 'Edm.Int32'
```

(Bug#45077)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. ([Bug#44455](#))
- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. ([Bug#43736](#))
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. ([Bug#43678](#))
- An error occurred when building MySQL Connector/NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

When an attempt was made to build (for example) the MySQL Connector/NET 5.2 branch using the command:

```
$ nant -buildfile:Client.build
```

The following error occurred:

```
BUILD FAILED

Error loading buildfile.
Encoding name 'Windows-1252' not supported.
Parameter name: name
```

([Bug#42411](#))

- MySQL Connector/NET CHM documentation stated that MySQL Server 3.23 was supported. ([Bug#42110](#))
 - In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.
- Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. ([Bug#40684](#))
- Calling a Stored Procedure with an output parameter through MySQL Connector/NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. ([Bug#36027](#))

D.4.4.7. Changes in MySQL Connector/NET 6.1.0 (15 July 2009 alpha)

This is the first Alpha release of 6.1.

Functionality added or changed:

- Changed GUID type - The backend representation of a guid type has been changed to be CHAR(36). This is so you can use the server UUID() function to populate a GUID table. UUID generates a 36 character string. Developers of older applications can add `old_guids=true` to the connection string and the old BINARY(16) type will be used instead.
- Support for native output parameters - This is supported when connected to a server that supports native output parameters. This includes servers as of 5.5.3 and 6.0.8.
- Session State Provider - This enables you to store the state of your website in a MySQL server.
- Website Configuration Dialog - This is a new wizard that is activated by clicking a button on the toolbar at the top of the Visual Studio Solution Explorer. It works in conjunction with the ASP.Net administration pages, making it easier to activate and set advanced options for the different MySQL web providers included.

D.4.5. Changes in MySQL Connector/NET Version 6.0.x

D.4.5.1. Changes in MySQL Connector/NET 6.0.8 (Not yet released)

Fixes bugs since 6.0.7.

Bugs fixed:

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. ([Bug#58906](#))
- Code introduced to fix [Bug#54863](#) proved problematic on .NET version 3.5 and above. ([Bug#58853](#))
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

The variable `token` was not used anywhere in the code. ([Bug#58757](#))

- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. ([Bug#58652](#))
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. ([Bug#58373](#))
- MySQL Connector/NET did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. ([Bug#58244](#))
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. ([Bug#57265](#))
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. ([Bug#57092](#))

- Setting the `Default Command Timeout` connection string option had no effect. ([Bug#56806](#))
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. ([Bug#56756](#))
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. ([Bug#56509](#))
- MySQL Connector/.NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. ([Bug#56410](#))
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. ([Bug#55349](#))

D.4.5.2. Changes in MySQL Connector/.NET 6.0.7 (30 August 2010)

Fixes bugs since 6.0.6.

Bugs fixed:

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.  
--OverflowException  
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo  
numfmt)  
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMyValue.ReadValue(MySqlPacket  
packet, Int64 length, Boolean nullVal)  
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,  
IMyValue valObject)  
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)  
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)  
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

([Bug#55644](#))

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. ([Bug#54895](#))
- Several calls to `dataadapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. ([Bug#54863](#))
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. ([Bug#54570](#))
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adpa-
ter.Update` either generated an exception or failed to batch the commands, executing each insert individually. ([Bug#54386](#))
- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOut-
ofRangeException`. ([Bug#54152](#), [Bug#53865](#))
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.  
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,  
Int32 count)  
MySql.Data.MySqlClient.MySqlStream.LoadPacket()  
Outer Exception Reading from the stream has failed.  
...
```

([Bug#53457](#))

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this  
Connection which must be closed first.]  
    MySql.Data.MySqlClient.MySqlCommand.CheckState() +278  
    MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43  
    MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6  
    Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323  
        Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)  
    in ...:13
```

```
Forecast.Page_Load(Object sender, EventArgs e) in ...:70
    System.Web.UI.Control.OnLoad(EventArgs e) +99
        System.Web.UI.Control.LoadRecursive() +50
            System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

([Bug#53357](#))

- Membership schema creation failed if the default schema collation was not Latin1. ([Bug#53174](#))
- EventLog was not disposed in the SessionState provider. ([Bug#52550](#))
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. ([Bug#50671](#))
- When an application was subjected to increased concurrent load, MySQL Connector/.NET generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\' already belongs to this DataSet.
```

([Bug#49118](#))

- The `INSERT` command was significantly slower with MySQL Connector/.NET 6.x compared to 5.x, when compression was enabled. ([Bug#48243](#))
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. ([Bug#44715](#))
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

MySQL Connector/.NET has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. ([Bug#38411](#))

- Database name was emitted into typed datasets. This prevented users using the configured default database. ([Bug#33870](#))

D.4.5.3. Changes in MySQL Connector/.NET 6.0.6 (28 April 2010)

Fixes bugs since 6.0.5.

Functionality added or changed:

- Procedure cacheing had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.
MySQL Connector/.NET has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. ([Bug#52562](#))
- MySQL Connector/.NET has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. ([Bug#47467](#))

Bugs fixed:

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not set to an instance of an object
```

(Bug#55170)

- In MySQL Connector/NET, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. ([Bug#52769](#))
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. ([Bug#52187](#))
- In MySQL Connector/NET, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

This meant that, for example, the Euro sign was not handled correctly.

The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. ([Bug#51927](#))

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. ([Bug#51788](#))
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.  
Parameter name: length
```

(Bug#51610)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. ([Bug#51149](#))
- `MySqlCommand.Parameters.Clear()` did not work. ([Bug#50444](#))
- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

(Bug#50344)

- Binary Columns were not displayed in the Query Builder of Visual Studio. ([Bug#50171](#))
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. ([Bug#50123](#))
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. ([Bug#49850](#))
- `MySqlDataReader.GetInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. ([Bug#49794](#))
- A `FormatException` was generated when an empty string was returned from a stored function. ([Bug#49642](#))
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. ([Bug#48974](#))

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. ([Bug#48944](#))
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. ([Bug#48171](#))

- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```

MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source=" MySql.Data"
ErrorCode=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()

```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. ([Bug#45277](#))
- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. ([Bug#41629](#))

D.4.5.4. Changes in MySQL Connector/NET 6.0.5 (12 November 2009)

This is a new release, fixing recently discovered bugs.

Bugs fixed:

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/NET was changed so that it was possible to do:

```
MySqlCommand clone = comm.Clone();
```

([Bug#48460](#))

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named "b`a`d" as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
    "Indexes",
    new string[] { null, schemaName, "b`a`d" });
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

([Bug#48101](#))

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

MySQL Connector/NET was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. ([Bug#48100](#))

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. ([Bug#47872](#))
- When loading the `MySQLClient-mono.sln` file included with the Connector/NET source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
```

```
Unsupported or unrecognized project:  
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):  
error CS0115: ` MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an  
override but no suitable property found to override
```

(Bug#47048)

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

This was due to the fact that the encoding field had not been initialized correctly. ([Bug#46844](#))

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. ([Bug#46620](#))
- The MySQL Connector/.NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

```

(Bug#46375)

- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. ([Bug#46311](#))
- MySQL Connector/.NET sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. ([Bug#46308](#))
- When using MySQL Connector/.NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type  
'System.ArgumentException' System.Data.DataTable {System.ArgumentException}  
base{"Input string was not in a correct format.Couldn't store <'Select'> in  
NUMERIC_PRECISION Column. Expected type is UInt64."}System.Exception  
{System.ArgumentException}
```

(Bug#46270)

- The MySQL Connector/.NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message "Parameter 'foo' not

found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(string parameterName = "pStart", bool throwOnNotFound = true) Line 459C#
MySql.Data.dll!MySql.Data.MySqlClient.StoredProcedure.Resolve() Line 157 + 0x25 bytesC#
MySql.Data.dll!MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(System.Data.CommandBehavior behavior = SequentialAccess) Line 405 + 0xb bytesC#
MySql.Data.dll!MySql.Data.MySqlClient.MySqlCommand.ExecuteReaderDbDataReader(System.Data.CommandBehavior behavior = SequentialAccess) Line 884 + 0xb bytesC#

System.Data.dll!System.Data.Common.DbDataAdapter.FillInternal(System.Data.DataSet dataset = {System.Data.DataSet}, System.Data.DataTable[] datatables = null, int startRecord = 0, int maxRecords = 0, string srcTable = "Table", System.Data.IDbCommand command = {MySql.Data.MySqlClient.MySqlCommand}, System.Data.CommandBehavior behavior) + 0x83 bytes
System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet, int startRecord, int maxRecords, string srcTable, System.Data.IDbCommand command, System.Data.CommandBehavior behavior) + 0x120 bytes
System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) + 0x5f bytes
```

(Bug#46213)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. ([Bug#46205](#), [Bug#46359](#), [Bug#41953](#))
- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
System.ArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.
```

(Bug#46100)

- In MySQL Connector/.NET 6.0.4 using `GetProcData` generated an error because the `parameters` data table was only created if MySQL Server was at least version 6.0.6, or if the `UseProcedureBodies` connection string option was set to true. Also the `DeriveParameters` command generated a null reference exception. This was because the `parameters` data table, which was null, was used in a `for each` loop. ([Bug#45952](#))
- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

This resulted in the data being unsorted. ([Bug#45723](#))

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. ([Bug#45699](#))
- Adding the `Allow Batch=False` option to the connection string caused MySQL Connector/.NET to generate the error:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'SET character_set_results=NULL' at line 1
```

(Bug#45502)

- The MySQL Connector/.NET 6.0.4 installer failed with an error. The error message generated was:

```
There is a problem with this Windows Installer package. A DLL required for this install to complete could not be run. Contact your support personnel or package vendor.
```

When OK was clicked to acknowledge the error the installer exited. ([Bug#45474](#))

- A MySQL Connector/.NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

This was due to a bug in Mono. MySQL Connector/.NET was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. ([Bug#45463](#))

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an

error message:

```
Unknown PrimitiveKind Time
```

([Bug#45457](#))

- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
The value given is not an instance of type 'Edm.Int32'
```

([Bug#45077](#))

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. ([Bug#44985](#))
- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. ([Bug#44455](#))
- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/.NET, an `IndexOutOfRangeException` exception was generated on trying to open the connection. ([Bug#43736](#))
- When reading data, such as with a `MySqlCommand` on a `MySqlConnection`, MySQL Connector/.NET could potentially enter an infinite loop in `CompressedStream.ReadNextPacket()` if compression was enabled. ([Bug#43678](#))
- An error occurred when building MySQL Connector/.NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

When an attempt was made to build (for example) the MySQL Connector/.NET 5.2 branch using the command:

```
$ nant -buildfile:Client.build
```

The following error occurred:

```
BUILD FAILED
Error loading buildfile.
Encoding name 'Windows-1252' not supported.
Parameter name: name
```

([Bug#42411](#))

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySQL.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

The error generated was:

```
Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
has no constructors defined MysqlTest
Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
likely culprit is 'COMPILE'.
```

([Bug#42261](#))

- MySQL Connector/.NET CHM documentation stated that MySQL Server 3.23 was supported. ([Bug#42110](#))
- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. ([Bug#40684](#))

- MySQL Connector/.NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
  bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
  bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
  bei System.Threading.ExecutionContext.runTryCode(Object userData)
  bei System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
  code, CleanupCode backoutCode, Object userData)
  bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
  ContextCallback callback, Object state)
  bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
```

```
ContextCallback callback, Object state)
bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

([Bug#40005](#))

- Calling a Stored Procedure with an output parameter through MySQL Connector/.NET resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. ([Bug#36027](#))
- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

([Bug#34657](#))

D.4.5.5. Changes in MySQL Connector/.NET 6.0.4 (16 June 2009)

This is the first post-GA release, fixing recently discovered bugs.

Bugs fixed:

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/.NET displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

```
Only one usage of each socket address (protocol/network address/port) is normally
permitted IP ADDRESS/PORT.
```

However, MySQL Connector/.NET masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

([Bug#45021](#))

- A SQL query string containing an escaped backslash caused an exception to be generated:

```
Index and length must refer to a location within the string.
Parameter name: length
at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
    fAlwaysCopy)
at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
    MySqlParameterCollection parameters, MySqlPacket packet)
at MySql.Data.MySqlClient.Statement.BindParameters()
at MySql.Data.MySqlClient.PreparableStatement.Execute()
at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

([Bug#44960](#))

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/.NET from source. ([Bug#44822](#))
- The Data Set editor generated an error when attempts were made to modify insert, update or delete commands:

```
Error in WHERE clause near '@'.
Unable to parse query text.
```

([Bug#44512](#))

- The DataReader in MySQL Connector/.NET 6.0.3 considered a BINARY(16) field as a GUID with a length of 16. ([Bug#44507](#))
- When creating a new DataSet the following error was generated:

```
Failed to open a connection to database.
Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
```

(Bug#44460)

- The MySQL Connector/.NET MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug#44414)
- MySQL Connector/.NET was missing the capability to validate the server's certificate when using encryption. This made it possible to conduct a man-in-the-middle attack against the connection, which defeated the security provided by SSL. (Bug#38700)

D.4.5.6. Changes in MySQL Connector/.NET 6.0.3 (28 April 2009)

First GA release.

Functionality added or changed:

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

```
INSERT INTO anytable SET Text='test--test';
```

The tokenizer incorrectly interpreted the value as containing a comment.

```
UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE ID=4711;'
```

A `MySqlException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```
Fatal error encountered during command execution.  
EXCEPTION: MySqlException - Parameter '?' must be defined.
```

(Bug#44318)

Bugs fixed:

- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when REFERENCES, ADD REFERENCE was selected. (Bug#44141)

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by `ISSchemaProvider` were `UNSIGNED`. (Bug#44123)

D.4.5.7. Changes in MySQL Connector/.NET 6.0.2 (07 April 2009 beta)

This is a new development release, fixing recently discovered bugs.

Bugs fixed:

- MySQL Connector/.NET 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

The following error message was generated:

```
.NET Framework Data Provider for MySQL: The data provider object factory service was not found.
```

(Bug#44064)

D.4.5.8. Changes in MySQL Connector/NET 6.0.1 (02 April 2009 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. ([Bug#43574](#))
- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message “Max value too long or too short for Int32”. ([Bug#43480](#))

D.4.5.9. Changes in MySQL Connector/NET 6.0.0 (02 March 2009 alpha)

This is a new Alpha development release.

Bugs fixed:

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. ([Bug#42801](#))

D.4.6. Changes in MySQL Connector/NET Version 5.3.x

D.4.6.1. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. ([Bug#39072](#))
- The MySQL Connector/NET installer program ended prematurely without reporting the specific error. ([Bug#39019](#))
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException`. ([Bug#38939](#))
- Possible overflow in `MySqlPacket.ReadLong()`. ([Bug#36997](#))
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. ([Bug#36836](#))

D.4.7. Changes in MySQL Connector/NET Version 5.2.x

D.4.7.1. Changes in MySQL Connector/NET 5.2.8 (Not yet released)

Bugs fixed:

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named "b`a`d" as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
    "Indexes",
    new string[] { null, schemaName, "b`a`d" });
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

([Bug#48101](#))

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. ([Bug#47153](#))

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. ([Bug#46620](#))
- When trying to create stored procedures from a SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
 MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source=" MySql.Data"
ErrorCodes=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. ([Bug#46429](#))

- The MySQL Connector/.NET Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application
-----
The requested feature is not implemented.
Description: HTTP 500. Error processing request.

Stack Trace:

System.NotImplementedException: The requested feature is not implemented.

```

([Bug#46375](#))

- When using MySQL Connector/.NET 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException' System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store '<Select>' in
NUMERIC_PRECISION Column. Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

([Bug#46270](#))

- The MySQL Connector/.NET method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message "Parameter 'foo' not found in the collection." and the following stack trace:

```
 MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(string
parameterName = "pStart", bool throwNotFound = true) Line 459C#

([Bug#46213](#))

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. ([Bug#46205](#), [Bug#46359](#), [Bug#41953](#))
- If the application slept for longer than the specified `net_write_timeout`, and then resumed `Read` operations on a connection, then the application failed silently. ([Bug#45978](#))
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/.NET could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. ([Bug#43678](#))
- An error occurred when building MySQL Connector/.NET from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

When an attempt was made to build (for example) the MySQL Connector/.NET 5.2 branch using the command:

```
$ nant -buildfile:Client.build
```

The following error occurred:

```
BUILD FAILED

Error loading buildfile.
Encoding name 'Windows-1252' not supported.
Parameter name: name
```

([Bug#42411](#))

- MySQL Connector/.NET CHM documentation stated that MySQL Server 3.23 was supported. ([Bug#42110](#))
- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

([Bug#34657](#))

D.4.7.2. Changes in MySQL Connector/.NET 5.2.7 (15 July 2009)

Bugs fixed:

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. ([Bug#45699](#))
- A MySQL Connector/.NET test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

This was due to a bug in Mono. MySQL Connector/.NET was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. ([Bug#45463](#))

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/.NET displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following

error text:

```
Only one usage of each socket address (protocol/network address/port) is normally  
permitted IP ADDRESS/PORT.
```

However, MySQL Connector/NET masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

([Bug#45021](#))

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/NET from source. ([Bug#44822](#))
- The MySQL Connector/NET MySQLRoleProvider reported that there were no roles, even when roles existed. ([Bug#44414](#))
- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework\MySQL.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

The error generated was:

```
Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'  
has no constructors defined MysqlTest  
Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):  
likely culprit is 'COMPILE'.
```

([Bug#42261](#))

- MySQL Connector/NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.  
bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)  
bei System.Threading._TimerCallback.TimerCallback_Context(Object state)  
bei System.Threading.ExecutionContext.runTryCode(Object userData)  
bei System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode  
code, CleanupCode backoutCode, Object userData)  
bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,  
ContextCallback callback, Object state)  
bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,  
ContextCallback callback, Object state)  
bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

([Bug#40005](#))

- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

```
The method or operation is not implemented
```

([Bug#39409](#))

D.4.7.3. Changes in MySQL Connector/NET 5.2.6 (28 April 2009)

Functionality added or changed:

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. ([Bug#44194](#))

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. ([Bug#43991](#))

- `GetSchema("MetaDataCollections")` should have returned a table with a column named “NumberOfRestrictions” not “NumberOfRestriction”.
- This can be confirmed by referencing the [Microsoft Documentation](#). ([Bug#43990](#))
- Requests sent to the MySQL Connector/.NET role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. ([Bug#43553](#))
 - When using `MySqlBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. ([Bug#43332](#))
 - A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. ([Bug#42801](#))
 - `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

The generated query was, for example:

```
SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
FROM my_aspnet_Membership WHERE userId=13
```

Note that `applicationId` is not used. ([Bug#42574](#))

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named “lastUpdatdDate” ('e' is missing) instead of the correct “lastUpdatedDate”. ([Bug#41654](#))
- The `GetGuid()` method of `MySqlDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. ([Bug#41452](#))
- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. ([Bug#41408](#))
- If a `Stored Procedure` contained spaces in its parameter list, and was then called from MySQL Connector/.NET, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

The exception generated was:

```
Parameter '0' not found in the collection.
```

([Bug#41034](#))

- The `DATETIME` format contained an erroneous space. ([Bug#41021](#))
- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

The exception generated was:

```
The profile default provider was not found.
```

Note that the exception stated: ‘the profile **default provider**...’, even though a different name was explicitly requested. ([Bug#40871](#))

- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. ([Bug#40139](#))

D.4.7.4. Changes in MySQL Connector/NET 5.2.5 (19 November 2008)

Bugs fixed:

- Visual Studio 2008 displayed the following error three times on start-up:

```
"Package Load Failure
Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
Version=5.2.4, Culture=neutral, PublicKeyToken=null' has failed to load properly (GUID =
{79A115C9-B133-4891-9ETB-242509DAD272}). Please contact the package vendor for
assistance. Application restart is recommended, due to possible environment corruption.
Would you like to disable loading the package in the future? You may use
'devenve/resetskippkgs' to re-enable package loading."
```

[\(Bug#40726\)](#)

D.4.7.5. Changes in MySQL Connector/NET 5.2.4 (13 November 2008)

Bugs fixed:

- `MySqlDataReader` did not feature a `GetSByte` method. ([Bug#40571](#))
- When working with stored procedures MySQL Connector/NET generated an exception `Unknown "table parameters" in information_schema.` ([Bug#40382](#))
- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. ([Bug#40231](#))
- If connection pooling was not set explicitly in the connection string, MySQL Connector/NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. ([Bug#40091](#))

- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained “??” instead of the correct national character symbols. ([Bug#40076](#))
- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- After the `ConnectionString` property was initialized using the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of `MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. ([Bug#39728](#))
- When using `ProfileProvider`, attempting to update a previously saved property failed. ([Bug#39330](#))
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. ([Bug#39294](#))
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. ([Bug#39275](#))
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

Also, if `TABLEADAPTER` was right-clicked and then `ADD, QUERY, USE EXISTING STORED PROCEDURES` selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. ([Bug#39252](#))

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerates-schema="true".` ([Bug#39072](#))
- MySQL Connector/NET called hashed password methods not supported in Mono 2.0 Preview 2. ([Bug#38895](#))

D.4.7.6. Changes in MySQL Connector/NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `Connection-State.Closed` event. ([Bug#38119](#))
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. ([Bug#36694](#))
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. ([Bug#36205](#))

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. ([Bug#38721](#))
- MySQL Connector/NET uninstaller did not clean up all installed files. ([Bug#38534](#))
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. ([Bug#38276](#))
- The provider did not silently create the user if the user did not exist. ([Bug#38243](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. ([Bug#37469](#))
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. ([Bug#37239](#))
- The `autogenerateschema` option produced tables with incorrect collations. ([Bug#36444](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

D.4.7.7. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated "?" is the preferred parameter marker. ([Bug#37349](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- Tables with `GEOMETRY` field types would return an unknown data type exception. ([Bug#36081](#))
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. ([Bug#36000](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. ([Bug#35336](#))
- An error would be raised when calling `GetPassword()` with a `NULL` value. ([Bug#35332](#))
- When retrieving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. ([Bug#35041](#))
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. ([Bug#34941](#))
- When creating a new stored procedures, the new parameter code which permits the use of the @ symbol would interfere with the specification of a `DEFINER`. ([Bug#34940](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. ([Bug#34001](#))
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. ([Bug#31338](#))
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

D.4.7.8. Changes in MySQL Connector/.NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. ([Bug#34792](#))
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. ([Bug#34699](#))
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to MySQL Connector/.NET not loading properly when using the interface to a MySQL server within Visual Studio. ([Bug#34674](#))
- A number issues were identified in the case, connection and schema areas of the code for `MembershipProvider`, `RoleProvider`, `ProfileProvider`. ([Bug#34495](#))
- When using web providers, the MySQL Connector/.NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the membership provider list. ([Bug#34451](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))

- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

D.4.7.9. Changes in MySQL Connector/NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))
- Added support for `DbDataAdapter UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the multi-value form if possible.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added ClearPool and ClearAllPools features.

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))
- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))

D.4.8. Changes in MySQL Connector/NET Version 5.1.x

D.4.8.1. Changes in MySQL Connector/NET 5.1.8 (Not yet released)

Bugs fixed:

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted. In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to

`GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. ([Bug#43991](#))

- The `DATETIME` format contained an erroneous space. ([Bug#41021](#))
- If connection pooling was not set explicitly in the connection string, MySQL Connector/.NET added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.

If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. ([Bug#40091](#))

- MySQL Connector/.NET generated the following exception:

```
System.NullReferenceException: Object reference not set to an instance of an object.
  bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
  bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
  bei System.Threading.ExecutionContext.runTryCode(Object userData)
  bei System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
  code, CleanupCode backoutCode, Object userData)
  bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
  ContextCallback callback, Object state)
  bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
  ContextCallback callback, Object state)
  bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

([Bug#40005](#))

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))
- Calling `MySqlDataAdapter.FillSchema` on a `SELECT` statement that referred to a table that did not exist left the connection in a bad state. After this call, all `SELECT` statements returned an empty result set. If the `SELECT` statement referred to a table that did exist then everything worked as expected. ([Bug#30518](#))

D.4.8.2. Changes in MySQL Connector/.NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. ([Bug#38276](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- In a .NET application MySQL Connector/.NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- As `MySqlDbType.DateTime` is not available in `VB.NET` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was al-

ways shown during compilation. ([Bug#37406](#))

- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. ([Bug#37398](#))
- Documentation incorrectly stated that “the `DataTable` class in .NET 1.0 and 1.1 does not permit columns with type of `UInt16`, `UInt32`, or `UInt64` to be autoincrement columns”. ([Bug#37350](#))
- `SemaphoreFullException` is generated when application is closed. ([Bug#36688](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

D.4.8.3. Changes in MySQL Connector/.NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrieval = true` and `RequireQuestionAndAnswer = false`. ([Bug#36159](#))
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. ([Bug#36157](#))
- Tables with `GEOMETRY` field types would return an unknown data type exception. ([Bug#36081](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. ([Bug#31338](#))

D.4.8.4. Changes in MySQL Connector/.NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/.NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))
- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- MySQL Connector/.NET would fail to compile properly with `nant`. ([Bug#33508](#))
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. ([Bug#33347](#))
- Using compression in the MySQL connection with MySQL Connector/.NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))

D.4.8.5. Changes in MySQL Connector/.NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with noninput direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- MySQL Connector/.NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. ([Bug#31703](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Trying to use a connection that was not open could return an ambiguous and misleading error message. ([Bug#31262](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/.NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)`) were not returned as boolean fields. ([Bug#27959](#))
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. ([Bug#27958](#))
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing

the server error code. ([Bug#27436](#))

- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

D.4.8.6. Changes in MySQL Connector/NET 5.1.3 (21 September 2007 beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- The Saudi Hijri calendar was not supported. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. ([Bug#29476](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. ([Bug#29236](#))
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. ([Bug#29235](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- *Visual Studio Plugin:* Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. ([Bug#29098](#))
- Using `TransactionScope` would cause an `InvalidOperationException`. ([Bug#28709](#))

D.4.8.7. Changes in MySQL Connector/NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. ([Bug#28706](#))
- Creating a user would fail due to the application name being set incorrectly. ([Bug#28648](#))
- *Visual Studio Plugin:* Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. ([Bug#28536](#))
- *Visual Studio Plugin:* Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. ([Bug#28437](#))
- Accessing the results from a large query when using data compression in the connection would fail to return all the data.

[Bug#28204](#))

- *Visual Studio Plugin:* Update commands would not be generated correctly when using the TableAdapter wizard. ([Bug#26347](#))

D.4.8.8. Changes in MySQL Connector/NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Installation of the MySQL Connector/NET on Windows would fail if VisualStudio had not already been installed. ([Bug#28260](#))
- MySQL Connector/NET would look for the wrong table when executing `User.IsRole()`. ([Bug#28251](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))
- Fixed password property on `MySqlConnectionConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

D.4.8.9. Changes in MySQL Connector/NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

D.4.9. Changes in MySQL Connector/NET Version 5.0.x

D.4.9.1. Changes in MySQL Connector/NET 5.0.10 (Not yet released)

Bugs fixed:

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. ([Bug#39817](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;  
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

(Bug#37955)

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug#36432)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug#35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug#33322)

D.4.9.2. Changes in MySQL Connector/NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. (Bug#35492)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with noninput direction using a constructor would fail. This was caused by some old legacy code preventing their use. (Bug#32093)
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug#32010)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug#31930)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug#31731)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug#31433)
- Column name metadata was not using the character set as defined within the connection string being used. (Bug#31185)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug#30964)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug#30116)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug#27436)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

D.4.9.3. Changes in MySQL Connector/NET 5.0.8 (21 August 2007)

Note

This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column

unique key index. ([Bug#30204](#))

- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- Fixed bug where MySQL Connector/NET was hand building some date time patterns rather than using the patterns provided under `CultureInfo`. This caused problems with some calendars that do not support the same ranges as Gregorian.. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. ([Bug#29123](#))
- Log messages would be truncated to 300 bytes. ([Bug#28706](#))
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. ([Bug#28204](#))
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. ExecuteReader had to be changed to check for this.

D.4.9.4. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. ([Bug#28448](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. ([Bug#27765](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. ([Bug#27289](#))
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. ([Bug#27269](#))
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction

are not possible. ([Bug#26754](#))

- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. ([Bug#26472](#))
- The `charset` property would not be identified during a connection (also affected Visual Studio Plugin). ([Bug#26147](#), [Bug#27240](#))
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. ([Bug#25947](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))

D.4.9.5. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `DESCRIBE` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. ([Bug#27221](#))
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. ([Bug#27187](#))
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- Exception thrown when using large values in `UInt64` parameters. ([Bug#27093](#))
- MySQL Visual Studio Plugin 1.1.2 does not work with MySQL Connector/NET 5.0.5. ([Bug#26960](#))

D.4.9.6. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to enable calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. ([Bug#26660](#))
- MySQL Connector/NET would fail to install under Windows Vista. ([Bug#26430](#))
- Opening a connection would be slow due to host name lookup. ([Bug#26152](#))
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. ([Bug#25950](#))

- Registry would be incorrectly populated with installation locations. ([Bug#25928](#))
- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- Returned data types of a `DataTypes` collection do not contain the right correct CLR data type. ([Bug#25907](#))
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. ([Bug#25906](#))
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- Filling a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))
- The `UpdateRowSource.FirstReturnedRecord` method does not work. ([Bug#25569](#))
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. ([Bug#25458](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- When a `MySQLConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. ([Bug#24802](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. ([Bug#24373](#))
- MySQL Connector/.NET would not compile properly when used with Mono 1.2. ([Bug#24263](#))
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

D.4.9.7. Changes in MySQL Connector/.NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

This section has no changelog entries.

D.4.9.8. Changes in MySQL Connector/.NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns.GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The SharpZipLib library has been replaced with the deflate support provided within .NET 2.0.

- SSL support has been updated.

Bugs fixed:

- Additional text added to error message ([Bug#25178](#))
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. ([Bug#25033](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. ([Bug#23687](#))
- Nested transactions (which are unsupported) do not raise an error or warning. ([Bug#22400](#))

D.4.9.9. Changes in MySQL Connector/.NET 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/.NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, MySQL Connector/.NET would incorrectly resolve host names. ([Bug#23758](#))
- Column names with accented characters were not parsed properly causing malformed column names in result sets. ([Bug#23657](#))
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. ([Bug#23538](#))
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. ([Bug#23268](#))
- During installation, an antivirus error message would be raised (indicating a malicious script problem). ([Bug#23245](#))
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that MySQL Connector/.NET 5.0.2 must be installed. ([Bug#23071](#))
- Using Windows Vista (RC2) as a nonprivileged user would raise a `Registry key 'Global' access denied`. ([Bug#22882](#))

- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug#18186](#))
- MySQL Connector/.NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. ([Bug#16126](#))

D.4.9.10. Changes in MySQL Connector/.NET 5.0.1 (01 October 2006)

Bugs fixed:

- MySQL Connector/.NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. ([Bug#22042](#))
- The `MySqlException` class is now derived from the `DbException` class. ([Bug#21874](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- You can now install the MySQL Connector/.NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/.NET exception. ([Bug#18391](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. ([Bug#11991](#))
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` ([Bug#7248](#))
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

D.4.9.11. Changes in MySQL Connector/.NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented PacketReader/PacketWriter support into `MySqlStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Implemented `MySqlClientFactory` class.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySqlConnectionBuilder` class.

Bugs fixed:

- CommandText: Question mark in comment line is being parsed as a parameter. ([Bug#6214](#))

D.4.10. Changes in MySQL Connector/NET Version 1.0.x

D.4.10.1. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. ([Bug#33682](#))
- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with noninput direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- Using compression in the MySQL connection with MySQL Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

D.4.10.2. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `SqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. ([Bug#24373](#))

D.4.10.3. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.

- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/.NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- Trying to fill a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- Additional text added to error message. ([Bug#25178](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. ([Bug#24802](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. ([Bug#23862](#))
- One system where IPv6 was enabled, MySQL Connector/.NET would incorrectly resolve host names. ([Bug#23758](#))
- Nested transactions do not raise an error or warning. ([Bug#22400](#))
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug 18186](#))

D.4.10.4. Changes in MySQL Connector/.NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedure metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- MySQL Connector/.NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. ([Bug#20581](#))
- You can now install the MySQL Connector/.NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#))
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. ([Bug#19515](#))
- When running a query that included a date comparison, a `DateReader` error would be raised. ([Bug#19481](#))
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. ([Bug#19294](#))
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. ([Bug#19261](#))
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/.NET exception. ([Bug#18391](#))
- An exception would be raised when using an output parameter to a `System.String` value. ([Bug#17814](#))
- CHAR type added to `MySqlDbType`. ([Bug#17749](#))
- A `SELECT` query on a table with a date with a value of '`0000-00-00`' would hang the application. ([Bug#17736](#))
- The `CommandBuilder` ignored Unsigned flag at Parameter creation. ([Bug#17375](#))
- When working with multiple threads, character set initialization would generate errors. ([Bug#17106](#))
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. ([Bug#16934](#))
- `DataReader` would show the value of the previous row (or last row with nonnull data) if the current row contained a `datetime` field with a null value. ([Bug#16884](#))
- Unsigned data types were not properly supported. ([Bug#16788](#))
- The connection string parser did not permit single or double quotation marks in the password. ([Bug#16659](#))
- The `MySqlDateTime` class did not contain constructors. ([Bug#15112](#))
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no parameters would cause an application crash. ([Bug#15077](#))
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. ([Bug#11991](#))
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). ([Bug#9619](#))
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. ([Bug#8131](#))
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` ([Bug#7248](#))
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

D.4.10.5. Changes in MySQL Connector/.NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. ([Bug#18570](#))
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. ([Bug#14631](#))
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. ([Bug#13927](#))
- Added support for the `cp932` character set. ([Bug#13806](#))
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. ([Bug#13753](#))
- The `Ping()` method did not update the `State` property of the `Connection` object. ([Bug#13658](#))
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. ([Bug#13632](#))
- A statement that contained multiple references to the same parameter could not be prepared. ([Bug#13541](#))

D.4.10.6. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- MySQL Connector/NET 1.0.5 could not connect on Mono. ([Bug#13345](#))
- Serializing a parameter failed if the first value passed in was `NULL`. ([Bug#13276](#))
- Field names that contained the following characters caused errors: `()%<>/` ([Bug#13036](#))
- The `nant` build sequence had problems. ([Bug#12978](#))
- The MySQL Connector/NET 1.0.5 installer would not install alongside MySQL Connector/NET 1.0.4. ([Bug#12835](#))

D.4.10.7. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- MySQL Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](#))
- With multiple hosts in the connection string, MySQL Connector/NET would not connect to the last host in the list. ([Bug#12628](#))
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. ([Bug#12551](#), [Bug#8724](#))
- The `cp1250` character set was not supported. ([Bug#11621](#))
- A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](#))
- Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](#))
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](#))
- MySQL Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](#))
- Added support to call a stored function from MySQL Connector/NET. ([Bug#10644](#))
- Connection could fail when .NET thread pool had no available worker threads. ([Bug#10637](#))
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](#))

- Decimal parameters caused syntax errors. ([Bug#10152](#), [Bug#11550](#), [Bug#10486](#))
- Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](#))
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](#))
- Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](#))
- MySQL Connector/.NET could not work properly with certain regional settings. (WL#8228)

D.4.10.8. Changes in MySQL Connector/.NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. ([Bug#7755](#))
- Quote character \222 not quoted in `EscapeString`. ([Bug#7724](#))
- `GetBytes` is working no more. ([Bug#7704](#))
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. ([Bug#7612](#))
- Clone method bug in `MySqlCommand`. ([Bug#7478](#))
- Problem with Multiple resultsets. ([Bug#7436](#))
- `MySqlAdapter.Fill` method throws error message `Non-negative number required.` ([Bug#7345](#))
- `MySqlCommand.Connection` returns an `IDbConnection`. ([Bug#7258](#))
- Calling prepare causing exception. ([Bug#7243](#))
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

D.4.10.9. Changes in MySQL Connector/.NET 1.0.3 (12 October 2004 gamma)

Bugs fixed:

- Invalid query string when using inout parameters ([Bug#7133](#))
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. ([Bug#7132](#))
- `MySqlDateTime` in Datatables sorting by Text, not Date. ([Bug#7032](#))
- Exception stack trace lost when re-throwing exceptions. ([Bug#6983](#))
- Errors in parsing stored procedure parameters. ([Bug#6902](#))
- InvalidCast when using `DATE_ADD`-function. ([Bug#6879](#))
- Int64 Support in `MySqlCommand` Parameters. ([Bug#6863](#))
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. ([Bug#6831](#))
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. ([Bug#6770](#))
- Integer "out" parameter from stored procedure returned as string. ([Bug#6668](#))
- An Open Connection has been Closed by the Host System. ([Bug#6634](#))
- Fixed Invalid character set index: 200. ([Bug#6547](#))

- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create START MENU items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

D.4.10.10. Changes in MySQL Connector/NET 1.0.2 (15 November 2004 gamma)

Bugs fixed:

- Fixed Objects not being disposed ([Bug#6649](#))
- Fixed Charset-map for UCS-2 ([Bug#6541](#))
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](#))
- Fixed double type handling in `MySqlParameter(string parameterName, object value)`. ([Bug#6428](#))
- Fixed Installation directory ignored using custom installation ([Bug#6329](#))
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ ([Bug#6322](#))
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with `MySqlBinary` where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

D.4.10.11. Changes in MySQL Connector/NET 1.0.1 (27 October 2004 beta)

Bugs fixed:

- Fixed IndexOutOfBoundsException when reading BLOB with `DataReader` with `GetString(index)` ([Bug#6230](#))
- Fixed `GetBoolean` returns wrong values ([Bug#6227](#))
- Fixed Method `TokenizeSql()` uses only a limited set of valid characters for parameters ([Bug#6217](#))
- Fixed NET Connector source missing resx files ([Bug#6216](#))
- Fixed `System.OverflowException` when using `YEAR` data type. ([Bug#6036](#))
- Fixed `MySqlDateTime` sets `IsZero` property on all subseq.records after first zero found ([Bug#6006](#))
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](#))

- Fixed missing Reference in DbType setter ([Bug#5897](#))
- Fixed Parsing the ';' char ([Bug#5876](#))
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](#))
- IsNullable error ([Bug#5796](#))
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](#))
- Fixed construtor initialize problems in MySqlCommand() ([Bug#5613](#))
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](#))
- Fixed Can't display Chinese correctly ([Bug#5288](#))
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](#))
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed [Bug#5458](#) Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed [Bug#5388](#) DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed [Bug#5602](#) Possible bug in MySqlParameter(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed [Bug#5392](#) MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed [Bug#5474](#) cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5469](#) Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

D.4.10.12. Changes in MySQL Connector/.NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. ([Bug#3889](#))
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.

- Added `COPYING.rtf` file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

D.4.11. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long SQL commands so blob columns do not blow out our log.
- Host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. ([Bug#5214](#))
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. ([Bug#5097](#))
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to enable use of @ parameter marker.
- `MySqlCommandBuilder`. ([Bug#4658](#))
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. ([Bug#4864](#))
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new .Types types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.

- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver ([Bug#4520](#))
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. ([Bug#4505](#))
- Added code to Parameter test case `TestQuoting` to test for backslashes.
- `MySqlCommandBuilder` fails with multi-word column names. ([Bug#4486](#))
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. ([Bug#4324](#))
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting maxPacketSize to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. ([Bug#4442](#))
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. ([Bug#4071](#))
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Enable reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. ([Bug#4074](#))
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. ([Bug#4149](#))
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. ([Bug#3917](#))

- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. ([Bug#3915](#))
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. ([Bug#3888](#))
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdatper` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

D.4.12. Changes in MySQL Connector/.NET Version 0.76

- Driver now using charset number given in handshake to create encoding.

- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionstring`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to permit it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionstring`.
- `ConnectionInternal` is now using PING to see whether the server is available.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to permit values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

D.4.13. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year data type now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.

- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

D.4.14. Changes in MySQL Connector/.NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `charset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.

- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed SQL parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to permit `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in MySQL 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlClient` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split SQL code (thanks everyone!).

D.4.15. Changes in MySQL Connector/.NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).

- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

D.4.16. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` data type handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkins-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command SQL processing so quotation marks are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded SQL, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlClient compliant so that DataReaders have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of Command worked properly.
- Fixed many small bugs found during benchmarking.

- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now PgSql.
- Added attribute to PgSql code to prevent designer from trying to show.
- Added `MySQLDbType` property to Parameter object and added proper conversion code to convert from `DbType` to `MySQLDbType`).
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only permits characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from Field.cs. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

D.4.17. Changes in MySQL Connector/.NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using `DBNull.Value` instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an auto_insert field is not present.
- Field now uses `typeof` keyword to return `System.Types` (performance).

D.4.18. Changes in MySQL Connector/NET Version 0.65

- `MySqlCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use xsd (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

D.4.19. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGridView` would work.

D.4.20. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.NET compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

D.5. MySQL Visual Studio Plugin Change History

Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section D.4, “MySQL Connector/NET Change History”](#).

D.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

D.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. ([Bug#24875](#))
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))

D.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (04 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft .Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

This section has no changelog entries.

D.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (04 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

D.6. MySQL Connector/J Change History

D.6.1. Changes in MySQL Connector/J 5.1.x

D.6.1.1. Changes in MySQL Connector/J 5.1.15 (Not yet released)

Fixes bugs found since release 5.1.14.

Bugs fixed:

- The hard-coded list of reserved words in Connector/J was not updated to reflect the list of reserved words in MySQL Server 5.5. ([Bug#59224](#))

D.6.1.2. Changes in MySQL Connector/J 5.1.14 (6th December 2010)

Fixes bugs found since release 5.1.13.

Functionality added or changed:

- Connector/J's load-balancing functionality only allowed the following events to trigger failover:
 - Transaction commit/rollback
 - CommunicationExceptions
 - Matches to user-defined Exceptions using the `loadBalanceSQLStateFailover`, `loadBalanceSQLExceptionSubclassFailover` or `loadBalanceExceptionChecker` property.

This meant that connections where auto-commit was enabled were not balanced, except for Exceptions, and this was problematic in the case of distribution of read-only work across slaves in a replication deployment.

The ability to load-balance while auto-commit is enabled has now been added to Connector/J. This introduces two new properties:

1. `loadBalanceAutoCommitStatementThreshold` - defines the number of matching statements which will trigger the driver to (potentially) swap physical server connections. The default value (0) retains the previously-established behavior that connections with auto-commit enabled are never balanced.
2. `loadBalanceAutoCommitStatementRegex` - the regular expression against which statements must match. The default value (blank) matches all statements.

Load-balancing will be done after the statement is executed, before control is returned to the application. If rebalancing fails, the driver will silently swallow the resulting Exception (as the statement itself completed successfully). ([Bug#55723](#))

Bugs fixed:

- Connection failover left slave/secondary in read-only mode. Failover attempts between two read-write masters did not properly set `this.currentConn.setReadOnly(false)`. ([Bug#58706](#))
- Connector/J mapped both 3-byte and 4-byte UTF8 encodings to the same Java UTF8 encoding.

To use 3-byte UTF8 with Connector/J set `characterEncoding=utf8` and set `useUnicode=true` in the connection string.

To use 4-byte UTF8 with Connector/J configure the MySQL server with `character_set_server=utf8mb4`. Connector/J will then use that setting as long as `characterEncoding` has not been set in the connection string. This is equivalent to autodetection of the character set. ([Bug#58232](#))

- The `CallableStatementRegression` test suite failed with a Null Pointer Exception because the `OUT` parameter in the `I__S.PARAMETERS` table had no name, that is `COLUMN_NAME` had the value `NULL`. ([Bug#58232](#))
- `DatabaseMetaData.supportsMultipleResultSets()` was hard-coded to return `false`, even though Connector/J supports multiple result sets. ([Bug#57380](#))
- Using the `useOldUTF8Behavior` parameter failed to set the connection character set to `latin1` as required.

In versions prior to 5.1.3, the handshake was done using `latin1`, and while there was logic in place to explicitly set the character set after the handshake was complete, this was bypassed when `useOldUTF8Behavior` was true. This was not a problem until 5.1.3, when the handshake was modified to use `utf8`, but the logic continued to allow the character set configured during that handshake process to be retained for later use. As a result, `useOldUTF8Behavior` effectively failed. ([Bug#57262](#))

- Invoking a stored procedure containing output parameters by its full name, where the procedure was located in another database, generated the following exception:

```
Parameter index of 1 is out of range (1, 0)
```

([Bug#57022](#))

- When a JDBC client disconnected from a remote server using `Connection.close()`, the TCP connection remained in the `TIME_WAIT` state on the server side, rather than on the client side. ([Bug#56979](#))
- Leaving Trust/ClientCertStoreType properties unset caused an exception to be thrown when connecting with `useSSL=true`, as no default was used. ([Bug#56955](#))
- When load-balanced connections swap servers, certain session state was copied from the previously active connection to the newly-selected connection. State synchronized included:
 - Auto-commit state
 - Transaction isolation state
 - Current schema/catalog

However, the read-only state was not synchronized, which caused problems if a write was attempted on a read-only connection. ([Bug#56706](#))

- When using Connector/J configured for failover (jdbc:mysql://host1,host2,... URLs), the non-primary servers re-balanced when the transactions on the master were committed or rolled-back. ([Bug#56429](#))
- An unhandled Null Pointer Exception (NPE) was generated in `DatabaseMetaData.java` when calling an incorrectly cased function name where no permission to access `mysql.proc` was available.

In addition to catching potential NPEs, a guard against calling JDBC functions with `db_name.proc_name` notation was also added. ([Bug#56305](#))

- Attempting to use JDBC4 functions on `Connection` objects resulted in errors being generated:

```
Exception in thread "main" java.lang.AbstractMethodError:  
com.mysql.jdbc.LoadBalancedMySQLConnection.createBlob()Ljava/sql/Blob;  
    at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)  
    at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39)  
    at  
sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25)  
    at java.lang.reflect.Method.invoke(Method.java:597)  
    at  
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:476)  
    at $Proxy0.createBlob(Unknown Source)
```

([Bug#56099](#))

D.6.1.3. Changes in MySQL Connector/J 5.1.13 (24 June 2010)

Fixes bugs found since release 5.1.12.

Functionality added or changed:

- Connector/J did not support `utf8mb4` for servers 5.5.2 and newer.

Connector/J now auto-detects servers configured with `character_set_server=utf8mb4` or treats the Java encoding `utf-8` passed using `characterEncoding=...` as `utf8mb4` in the `SET NAMES=` calls it makes when establishing the connection. ([Bug#54175](#))

Bugs fixed:

- The method `unSafeStatementInterceptors()` contained an erroneous line of code, which resulted in the interceptor being called, but the result being thrown away. ([Bug#53041](#))
- There was a performance regression of roughly 25% between r906 and r907, which appeared to be caused by pushing the Proxy down to the I/O layer. ([Bug#52534](#))
- Logic in implementations of `LoadBalancingConnectionProxy` and `LoadBalanceStrategy` behaved differently as to which `SQLExceptions` trigger failover to a new host. The former looked at the first two characters of the SQLState:

```
if (sqlState.startsWith("08"))  
...
```

The latter used a different test:

```
if (sqlEx instanceof CommunicationsException  
|| "08S01".equals(sqlEx.getSQLState())) {  
...
```

This meant it was possible for a new `Connection` object to throw an `Exception` when the first selected host was unavailable. This happened because `MySqlIO.createNewIO()` could throw an `SQLException` with a `SQLState` of "08001", which did not trigger the "try another host" logic in the `LoadBalanceStrategy` implementations, so an `Exception` was thrown after having only attempted connecting to a single host. ([Bug#52231](#))

- In the file `DatabaseMetadata.java`, the function `private void getCallStmtParameterTypes` failed if the parameter was defined over more than one line by using the '\n' character. ([Bug#52167](#))
- The catalog parameter, `PARAM_CAT`, was not correctly processed when calling for metadata with `getMetaData()` on stored procedures. This was because `PARAM_CAT` was hardcoded in the code to `NULL`. In the case where `nullcatalog-meanscurrent` was `true`, which is its default value, a crash did not occur, but the metadata returned was for the stored procedures from the catalog currently attached to. If, however, `nullcatalogmeanscurrent` was set to `false` then a crash resulted.

Connector/J has been changed so that when `NULL` is passed as `PARAM_CAT` it will not crash when `nullcatalog-meanscurrent` is `false`, but rather iterate all catalogs in search of stored procedures. This means that `PARAM_CAT` is no longer hardcoded to `NULL` (see [Bug#51904](#)). ([Bug#51912](#))

- A load balanced `Connection` object with multiple open underlying physical connections rebalanced on `commit()`, `rollback()`, or on a communication exception, without validating the existing connection. This caused a problem when there was no pinging of the physical connections, using queries starting with “/* ping */”, to ensure they remained active. This meant that calls to `Connection.commit()` could throw a `SQLException`. This did not occur when the transaction was actually committed; it occurred when the new connection was chosen and the driver attempted to set the auto-commit or transaction isolation state on the newly chosen physical connection. ([Bug#51783](#))
- The `rollback()` method could fail to rethrow a `SQLException` if the server became unavailable during a rollback. The errant code only rethrew when `ignoreNonTxTables` was true and the exception did not have the error code 1196, `SQLERror.ER_WARNING_NOT_COMPLETE_ROLLBACK`. ([Bug#51776](#))
- When the `allowMultiQueries` connection string option was set to `true`, a call to `Statement.executeBatch()` scanned the query for escape codes, even though `setEscapeProcessing(false)` had been called previously. ([Bug#51704](#))
- When a `StatementInterceptor` was used and an alternate `ResultSet` was returned from `preProcess()`, the original statement was still executed. ([Bug#51666](#))
- Objects created by `ConnectionImpl`, such as prepared statements, hold a reference to the `ConnectionImpl` that created them. However, when the load balancer picked a new connection, it did not update the reference contained in, for example, the `PreparedStatement`. This resulted in inserts and updates being directed to invalid connections, while commits were directed to the new connection. This resulted in silent data loss. ([Bug#51643](#))
- `jdbc:mysql:loadbalance://` would connect to the same host, even though `loadBalanceStrategy` was set to a value of `random`, and multiple hosts were specified. ([Bug#51266](#))
- An unexpected exception when trying to register `OUT` parameters in `CallableStatement`.
Sometimes Connector/J was not able to register `OUT` parameters for `CallableStatements`. ([Bug#43576](#))

D.6.1.4. Changes in MySQL Connector/J 5.1.12 (18 February 2010)

Fixes bugs found since release 5.1.11.

Bugs fixed:

- The catalog parameter was ignored in the `DatabaseMetaData.getProcedure()` method. It returned all procedures in all databases. ([Bug#51022](#))
- A call to `DatabaseMetaData.getDriverVersion()` returned the revision as `mysql-connector-java-5.1.11 (Revision: ${svn.Revision})`. The variable `${svn.Revision}` was not replaced by the SVN revision number. ([Bug#50288](#))

D.6.1.5. Changes in MySQL Connector/J 5.1.11 (21 January 2010)

Fixes bugs found since release 5.1.10.

Functionality added or changed:

- Replication connections, those with URLs that start with `jdbc:mysql:replication`, now use a `jdbc:mysql:loadbalance` connection for the slave pool. This means that it is possible to set load balancing properties such as `loadBalanceBlacklist-Timeout` and `loadBalanceStrategy` to choose a mechanism for balancing the load, and failover or fault tolerance strategy for the slave pool. ([Bug#49537](#))

Bugs fixed:

- `NullPointerException` sometimes occurred in `invalidateCurrentConnection()` for load-balanced connections. ([Bug#50288](#))
- The `deleteRow` method caused a full table scan, when using an updatable cursor and a multibyte character set. ([Bug#49745](#))
- For pooled connections, Connector/J did not process the session variable `time_zone` when set using the URL, resulting in incorrect timestamp values being stored. ([Bug#49700](#))
- The `ExceptionInterceptor` class did not provide a `Connection` context. ([Bug#49607](#))

- Ping left closed connections in the liveConnections map, causing subsequent Exceptions when that connection was used. ([Bug#48605](#))
- Using `MysqlConnectionPoolDataSource` with a load-balanced URL generated exceptions of type `ClassCastException`:

```
ClassCastException in MysqlConnectionPoolDataSource  
Caused by: java.lang.ClassCastException: $Proxy0  
    at  
com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource.getPooledConnection(MysqlConne  
ctionPoolDataSource.java:80)
```

```
java.lang.ClassCastException: $Proxy2  
at com.mysql.jdbc.optional.StatementWrapper.executeQuery(StatementWrapper.java:744)
```

([Bug#48486](#))

- The implementation for load-balanced `Connection` used a proxy, which delegated method calls, including `equals()` and `hashCode()`, to underlying `Connection` objects. This meant that successive calls to `hashCode()` on the same object potentially returned different values, if the proxy state had changed such that it was utilizing a different underlying connection. ([Bug#48442](#))
- The batch rewrite functionality attempted to identify the start of the `VALUES` list by looking for “VALUES ” (with trailing space). However, valid MySQL syntax permits `VALUES` to be followed by whitespace or an opening parenthesis:

```
INSERT INTO tbl VALUES  
(1);  
  
INSERT INTO tbl VALUES(1);
```

Queries written with the above formats did not therefore gain the performance benefits of the batch rewrite. ([Bug#48172](#))

- A PermGen memory leak was caused by the Connector/J statement cancellation timer (`java.util.Timer`). When the application was unloaded the cancellation timer did not terminate, preventing the ClassLoader from being garbage collected. ([Bug#36565](#))
- With the connection string option `noDatetimeStringSync` set to `true`, and server-side prepared statements enabled, the following exception was generated if an attempt was made to obtain, using `ResultSet.getString()`, a datetime value containing all zero components:

```
java.sql.SQLException: Value '0000-00-00' can not be represented as java.sql.Date
```

([Bug#32525](#))

D.6.1.6. Changes in MySQL Connector/J 5.1.10 (23 September 2009)

Fixes bugs found since release 5.1.9.

Bugs fixed:

- The `DriverManager.getConnection()` method ignored a non-standard port if it was specified in the JDBC connection string. Connector/J always used the standard port 3306 for connection creation. For example, if the string was `jdbc:mysql://localhost:6777`, Connector/J would attempt to connect to port 3306, rather than 6777. ([Bug#47494](#))

D.6.1.7. Changes in MySQL Connector/J 5.1.9 (21 September 2009)

Bugs fixed:

- In the class `com.mysql.jdbc.jdbc2.optional.SuspendableXAConnection`, which is used when `pinGlobalAltTxToPhysicalConnection=true`, there is a static map (`XIDS_TO_PHYSICAL_CONNECTIONS`) that tracks the Xid with the XAConnection, however this map was not populated. The effect was that the `SuspendableXAConnection` was never pinned to the real XA connection. Instead it created new connections on calls to `start`, `end`, `resume`, and `prepare`. ([Bug#46925](#))
- When using the ON DUPLICATE KEY UPDATE functionality together with the rewriteBatchedStatements option set to true, an exception was generated when trying to execute the prepared statement:

```
INSERT INTO config_table (modified,id_) VALUES (?,?) ON DUPLICATE KEY UPDATE modified=?
```

The exception generated was:

```
java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is 2).
    at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:135)
.....
Caused by: java.sql.SQLException: Parameter index out of range (3 > number of parameters,
which is 2).
    at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:1055)
    at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:956)
    at com.mysql.jdbc.SQLError.createSQLException(SQLError.java:926)
    at com.mysql.jdbc.PreparedStatement.checkBounds(PreparedStatement.java:3657)
    at com.mysql.jdbc.PreparedStatement.setInternal(PreparedStatement.java:3641)
    at
com.mysql.jdbc.PreparedStatement.setBytesNoEscapeNoQuotes(PreparedStatement.java:3391)
    at
com.mysql.jdbc.PreparedStatement.setOneBatchedParameterSet(PreparedStatement.java:4203)
    at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1759)
    at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1441)
    at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:131)
... 16 more
```

([Bug#46788](#))

- When Connector/J encountered an error condition that caused it to create a [CommunicationsException](#), it tried to build a friendly error message that helped diagnose what was wrong. However, if there had been no network packets received from the server, the error message contained the following incorrect text:

```
The last packet successfully received from the server was 1,249,932,468,916 milliseconds
ago. The last packet sent successfully to the server was 0 milliseconds ago.
```

([Bug#46637](#))

- The [getSuperTypes](#) method returned a result set with incorrect names for the first two columns. The name of the first column in the result set was expected to be [TYPE_CAT](#) and that of the second column [TYPE_SCHEM](#). The method however returned the names as [TABLE_CAT](#) and [TABLE_SCHEM](#) for first and second column respectively. ([Bug#44508](#))
- SQLException for data truncation error gave the error code as 0 instead of 1265. ([Bug#44324](#))
- Calling [ResultSet.deleteRow\(\)](#) on a table with a primary key of type [BINARY\(8\)](#) silently failed to delete the row, but only in some repeatable cases. The generated [DELETE](#) statement generated corrupted part of the primary key data. Specifically, one of the bytes was changed from 0x90 to 0x9D, although the corruption appeared to be different depending on whether the application was run on Windows or Linux. ([Bug#43759](#))
- Accessing result set columns by name after the result set had been closed resulted in a NullPointerException instead of a SQLException. ([Bug#41484](#))
- [QueryTimeout](#) did not work for batch statements waiting on a locked table.

When a batch statement was issued to the server and was forced to wait because of a locked table, Connector/J only terminated the first statement in the batch when the timeout was exceeded, leaving the rest hanging. ([Bug#34555](#))

- The [parseURL](#) method in class [com.mysql.jdbc.Driver](#) did not work as expected. When given a URL such as "jdbc:mysql://www.mysql.com:12345/my_database" to parse, the property [PORT_PROPERTY_KEY](#) was found to be [null](#) and the [HOST_PROPERTY_KEY](#) property was found to be "www.mysql.com:12345".

Note

Connector/J has been fixed so that it will now always fill in the [PORT](#) property (using 3306 if not specified), and the [HOST](#) property (using [localhost](#) if not specified) when [parseURL\(\)](#) is called. The driver also parses a list of hosts into [HOST.n](#) and [PORT.n](#) properties as well as adding a property [NUM_HOSTS](#) for the number of hosts it has found. If a list of hosts is passed to the driver, [HOST](#) and [PORT](#) will be set to the values given by [HOST.1](#) and [PORT.1](#) respectively. This change has centralized and cleaned up a large section of code used to generate lists of hosts, both for load-balanced and fault tolerant connections and their tests.

([Bug#32216](#))

- Attempting to delete rows using [ResultSet.deleteRow\(\)](#) did not delete rows correctly. ([Bug#27431](#))
- The [setDate](#) method silently ignored the Calendar parameter. The code was implemented as follows:

```
public void setDate(int parameterIndex, java.sql.Date x, Calendar cal) throws SQLException {
```

```

    setDate(parameterIndex, x);
}

```

From reviewing the code it was apparent that the Calendar parameter `cal` was ignored. ([Bug#23584](#))

D.6.1.8. Changes in MySQL Connector/J 5.1.8 (16 July 2009)

Bugs fixed:

- The reported milliseconds since the last server packets were received/sent was incorrect by a factor of 1000. For example, the following method call:

```

SQLError.createLinkFailureMessageBasedOnHeuristics(
(ConnectionStringImpl) this.conn,
System.currentTimeMillis() - 1000,
System.currentTimeMillis() - 2000,
e,
false);

```

returned the following string:

```

The last packet successfully received from the server
was 2 milliseconds ago. The last packet sent successfully to the
server was 1 milliseconds ago.

```

([Bug#45419](#))

- Calling `Connection.serverPrepareStatement()` variants that do not take result set type or concurrency arguments returned statements that produced result sets with incorrect defaults, namely `TYPE_SCROLL_SENSITIVE`. ([Bug#45171](#))
- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. ([Bug#44869](#))
- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44868](#))
- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. ([Bug#44867](#))

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44865](#))
- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44863](#))
- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. ([Bug#44862](#))
- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationException` exceptions generated. However, this code was never reached.

In the `CommunicationException` code:

```

private boolean streamingResultSetInPlay = false;

public CommunicationException(ConnectionStringImpl conn, long lastPacketSentTimeMs,
long lastPacketReceivedTimeMs, Exception underlyingException) {
    this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
        lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
        this.streamingResultSetInPlay);
}

```

`streamingResultSetInPlay` was always false, which in the following code in `SQLERror.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```

if (streamingResultSetInPlay) {
    exceptionMessageBuf.append(
        Messages.getString("CommunicationsException.ClientWasStreaming")); //$/NON-NLS-1$
} else {
...

```

([Bug#44588](#))

- The `SQLError.createLinkFailureMessageBasedOnHeuristics()` method created a message text for communication link failures. When certain conditions were met, this message included both “last packet sent” and “last packet received” information, but when those conditions were not met, only “last packet sent” information was provided.

Information about when the last packet was successfully received should be provided in all cases. ([Bug#44587](#))

- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. ([Bug#44056](#))
- Using `useInformationSchema` with `DatabaseMetaData.getExportedKeys()` generated the following exception:

```

com.mysql.jdbc.exceptions.MySQLIntegrityConstraintViolationException: Column
'REFERENCED_TABLE_NAME' in where clause is ambiguous
...
at com.mysql.jdbc.PreparedStatement.executeInternal(PreparedStatement.java:1772)
at com.mysql.jdbc.PreparedStatement.executeQuery(PreparedStatement.java:1923)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.executeMetadataQuery(
DatabaseMetaDataUsingInfoSchema.java:50)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.getExportedKeys(
DatabaseMetaDataUsingInfoSchema.java:603)

```

([Bug#43714](#))

- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness. `LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. ([Bug#43421](#))

- The method `Statement.getGeneratedKeys()` did not return values for `UNSIGNED BIGINTS` with values greater than `Long.MAX_VALUE`.

Unfortunately, because the server does not tell clients what TYPE the auto increment value is, the driver cannot consistently return `BigIntegers` for the result set returned from `getGeneratedKeys()`, it will only return them if the value is greater than `Long.MAX_VALUE`. If your application needs this consistency, it will need to check the class of the return value from `.getObject()` on the `ResultSet` returned by `Statement.getGeneratedKeys()` and if it is not a `BigInteger`, create one based on the `java.lang.Long` that is returned. ([Bug#43196](#))

- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. ([Bug#43071](#))
- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. ([Bug#43070](#))
- Connector/J generated an unhandled `StringIndexOutOfBoundsException`:

```

java.lang.StringIndexOutOfBoundsException: String index out of range: -1
at java.lang.String.substring(String.java:1938)
at com.mysql.jdbc.EscapeProcessor.processTimeToken(EscapeProcessor.java:353)
at com.mysql.jdbc.EscapeProcessor.escapeSQL(EscapeProcessor.java:257)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1546)
at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1524)

```

([Bug#42253](#))

- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```

java.util.ConcurrentModificationException
at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
at java.util.HashMap$KeyIterator.next(Unknown Source)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.getGlobalBlacklist(LoadBalancingConnectionProxy.java:520)
at com.mysql.jdbc.RandomBalanceStrategy.pickConnection(RandomBalanceStrategy.java:55)

```

```

at
com.mysql.jdbc.LoadBalancingConnectionProxy.pickNewConnection(LoadBalancingConnectionProxy.java:414)
at
com.mysql.jdbc.LoadBalancingConnectionProxy.invoke(LoadBalancingConnectionProxy.java:390)

```

(Bug#42055)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. ([Bug#41730](#))
- If there was an apostrophe in a comment in a statement that was being sent through Connector/J, the apostrophe was still recognized as a quote and put the state machine in `EscapeTokenizer` into the `inQuotes` state. This led to further parse errors.

For example, consider the following statement:

```

String sql = "-- Customer's zip code will be fixed\n" +
    "update address set zip_code = 99999\n" +
    "where not regexp '^[0-9]{5}([[-.]]?)?([0-9]{4})?$$'";

```

When passed through Connector/J, the `EscapeTokenizer` did not recognize that the first apostrophe was in a comment and thus set `inQuotes` to true. When that happened, the quote count was incorrect and thus the regular expression did not appear to be in quotation marks. With the parser not detecting that the regular expression was in quotation marks, the curly braces were recognized as escape sequences and were removed from the regular expression, breaking it. The server thus received SQL such as:

```

-- Customer's zip code will be fixed
update address set zip_code = '99999'
where not regexp '^[0-9]([[-.]]?)?([0-9])?$$'

```

(Bug#41566)

- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

Note

The performance regression in `indexOfIgnoreCaseRespectMarker()` has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

(Bug#41532)

- When accessing a result set column by name using `ResultSetImpl.findColumn()` an exception was generated:

```

java.lang.NullPointerException
at com.mysql.jdbc.ResultSetImpl.findColumn(ResultSetImpl.java:1103)
at com.mysql.jdbc.ResultSetImpl.getShort(ResultSetImpl.java:5415)
at org.apache.commons.dbcp.DelegatingResultSet.getShort(DelegatingResultSet.java:219)
at com.zimbra.cs.db.DbVolume.constructVolume(DbVolume.java:297)
at com.zimbra.cs.db.DbVolume.get(DbVolume.java:197)
at com.zimbra.cs.db.DbVolume.create(DbVolume.java:95)
at com.zimbra.cs.store.Volume.create(Volume.java:227)
at com.zimbra.cs.store.Volume.create(Volume.java:189)
at com.zimbra.cs.service.admin.CreateVolume.handle(CreateVolume.java:48)
at com.zimbra.soap.SoapEngine.dispatchRequest(SoapEngine.java:428)
at com.zimbra.soap.SoapEngine.dispatch(SoapEngine.java:285)

```

(Bug#41484)

- The `RETURN_GENERATED_KEYS` flag was being ignored. For example, in the following code the `RETURN_GENERATED_KEYS` flag was ignored:

```

PreparedStatement ps = connection.prepareStatement("INSERT INTO table
values(?,?)",PreparedStatement.RETURN_GENERATED_KEYS);

```

(Bug#41448)

- When using Connector/J 5.1.7 to connect to MySQL Server 4.1.18 the following error message was generated:

```

Thu Dec 11 17:38:21 PST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}

```

This occurred with MySQL Server version that did not support `auto_increment_increment`. The error message should not have been generated. ([Bug#41416](#))

- When `DatabaseMetaData.getProcedureColumns()` was called, the value for `LENGTH` was always returned as 65535, regardless of the column type (fixed or variable) or the actual length of the column.

However, if you obtained the `PRECISION` value, this was correct for both fixed and variable length columns. ([Bug#41269](#))

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERTS`. ([Bug#41161](#))
- Error message strings contained variable values that were not expanded. For example:

```
Mon Nov 17 11:43:18 JST 2008 WARN: Invalid value {1} for server variable named {0},  
falling back to sane default of {2}
```

([Bug#40772](#))

- When using `rewriteBatchedStatements=true` with:

```
INSERT INTO table_name_values (...) VALUES (...)
```

Query rewriting failed because “values” at the end of the table name was mistaken for the reserved keyword. The error generated was as follows:

```
testBug40439(testsuite.simple.TestBug40439)java.sql.BatchUpdateException: You have an  
error in your SQL syntax; check the manual that corresponds to your MySQL server version  
for the right syntax to use near 'values (2,'toto',2),(id,data, ordr) values  
(3,'toto',3),(id,data, ordr) values (' at line 1  
at com.mysql.jdbc.PreparedStatement.executeBatchedInserts(PreparedStatement.java:1495)  
at com.mysql.jdbc.PreparedStatement.executeBatch(PreparedStatement.java:1097)  
at testsuite.simple.TestBug40439.testBug40439(TestBug40439.java:42)  
at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)  
at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39)  
at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25)  
at testsuite.simple.TestBug40439.main(TestBug40439.java:57)
```

([Bug#40439](#))

- A statement interceptor received the incorrect parameters when used with a batched statement. ([Bug#39426](#))
- Using Connector/J 5.1.6 the method `ResultSet.getObject` returned a `BYTE[]` for following:

```
SELECT TRIM(rowid) FROM tbl
```

Where `rowid` had a type of `INT(11) PRIMARY KEY AUTO_INCREMENT`.

The expected return type was one of `CHAR`, `VARCHAR`, `CLOB`, however, a `BYTE[]` was returned.

Further, adding `functionsNeverReturnBlobs=true` to the connection string did not have any effect on the return type. ([Bug#38387](#))

D.6.1.9. Changes in MySQL Connector/J 5.1.7 (21 October 2008)

Functionality added or changed:

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs fixed:

- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. ([Bug#42309](#))
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an “S”, in an attempt

to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. ([Bug#40031](#))

- With large result sets `ResultSet.findColumn` became a performance bottleneck. ([Bug#39962](#))
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment`. ([Bug#39956](#))
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. ([Bug#39911](#))
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with “08”, it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

```
int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn))).intValue
```

This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. ([Bug#39784](#))

- When configuring the Java Replication Driver the last slave specified was never used. ([Bug#39611](#))
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. ([Bug#39352](#))
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. ([Bug#38782](#))
- Connector/J threw the following exception when using a read-only connection:

```
java.sql.SQLException: Connection is read-only. Queries leading to data modification are not allowed.
```

([Bug#38747](#))

- Connector/J was unable to connect when using a non-`latin1` password. ([Bug#37570](#))
- The `useOldAliasMetadataBehavior` connection property was ignored. ([Bug#35753](#))
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. ([Bug#35170](#))
- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. ([Bug#34185](#))
- The `loadBalance bestResponseTime` blacklists did not have a global state. ([Bug#33861](#))

D.6.1.10. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` parameters. ([Bug#33678](#))
- XACONNECTIONS and datasources have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible using the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a nonverifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. ([Bug#36830](#))
- When trying to read `Time` values like “00:00:00” with `ResultSet.getTime(int)` an exception is thrown. ([Bug#36051](#))
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. ([Bug#35810](#))
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. ([Bug#35666](#))
- When using the keyword “loadbalance” in the connection string and trying to perform load balancing between two databases, the driver appears to hang. ([Bug#35660](#))
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. ([Bug#35610](#))
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. ([Bug#35489](#))
- In calling a stored function returning a `bigint`, an exception is encountered beginning:

```
java.sql.SQLException: java.lang.NumberFormatException: For input string:
```

followed by the text of the stored function starting after the argument list. ([Bug#35199](#))

- The JDBC driver uses a different method for evaluating column names in `resultSet.getColumnName()` and when looking for a column in `resultSet.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

```
SELECT column AS aliasName from table
```

([Bug#35150](#))

- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from `ConnectionProperties` are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. ([Bug#34937](#))
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMP`s when using server-side prepared statements (not enabled by default). ([Bug#34913](#))
- `RowDataStatic` does't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. ([Bug#34762](#))
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. ([Bug#34703](#))
- It was not possible to truncate a `BLOB` using `Blobtruncate()` when using 0 as an argument. ([Bug#34677](#))
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. ([Bug#34518](#))
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. ([Bug#34194](#))
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. ([Bug#34093](#))
- The internal class `ResultSetInternalMethods` referenced the nonpublic class `com.mysql.jdbc.CachedResultSetMetaData`. ([Bug#33823](#))
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. ([Bug#33734](#))
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. ([Bug#33594](#))
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. ([Bug#33162](#))

- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name using the `loadBalanceStrategy` configuration property. ([Bug#32877](#))

- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values , as the hours end up being the same when sent as the literal that MySQL requires.

Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

This bug fix also fixes [Bug#15604](#), by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (that is, the old date/time handling code will be deprecated) ([Bug#32577](#), [Bug#15604](#))

- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver than hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. ([Bug#32246](#))
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. ([Bug#32101](#))
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBoundsException` exception when setting the last parameter to null. ([Bug#31823](#))
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. ([Bug#31790](#))
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. ([Bug#31192](#))
- Further fixes have been made to this bug in the event that a node is nonresponsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. ([Bug#31053](#))
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. ([Bug#30508](#))
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. ([Bug#20491](#))
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

D.6.1.11. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than $5 * \text{stddev}$ of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. ([Bug#28256](#))
- When calling `setTimestamp` on a prepared statement, the timezone information stored in the calendar object was ignored. This resulted in the incorrect `DATETIME` information being stored. The following example illustrates this:

```
Timestamp t = new Timestamp( cal.getTimeInMillis() );
ps.setTimestamp( N, t, cal );
```

([Bug#15604](#))

D.6.1.12. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

This section has no changelog entries.

D.6.1.13. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to permit user names or database names in any character set to be used in the JDBC connection URL. ([Bug#29853](#))
- Added two configuration parameters:
 - `blobsAreStrings`: Should the driver always treat BLOBS as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBS` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client/server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in [com/mysql/jdbc/interceptors](#). Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).

- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` through the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.
- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement/PreparedStatement/CallableStatement.executeBatch()` when `re-writeBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on com.mysql.jdbc.Statement: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
 - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBS`. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. ([Bug#30892](#))
- NPE with null column values when `padCharsWithSpace` is set to true. ([Bug#30851](#))
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. ([Bug#30664](#))
- An `ArithmaticException` or `NullPointerException` would be raised when the batch had zero members and `re-writeBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immedi-

ately after `clearBatch()`. ([Bug#30550](#))

- Closing a load-balanced connection would cause a `ClassCastException`. ([Bug#29852](#))
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". ([Bug#29106](#))
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. ([Bug#28972](#))
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as `IN` parameters but permit callers to call `registerOutParameter()` on them without throwing an exception. ([Bug#28689](#))

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. ([Bug#27915](#))
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. ([Bug#27867](#))
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . ([Bug#27182](#))
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. ([Bug#21116](#))
- Specifying a "validation query" in your connection pool that starts with `/* ping */` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

D.6.1.14. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

D.6.1.15. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is

ever active.

- Similar to [Connection](#), we pulled out vendor extensions to [Statement](#) into an interface named [com.mysql.Statement](#), and moved the [Statement](#) class into [com.mysql.StatementImpl](#). The two methods (javadoc'd in [com.mysql.Statement](#)) are [enableStreamingResults\(\)](#), which already existed, and [disableStreamingResults\(\)](#) which sets the statement instance back to the fetch size and result set type it had before [enableStreamingResults\(\)](#) was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has [BLOB](#) or [TEXT](#) types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property [largeRowSizeThreshold](#), which has a default value of 2KB.
- Added experimental support for statement "interceptors" through the [com.mysql.jdbc.StatementInterceptor](#) interface, examples are in [com/mysql/jdbc/interceptors](#).

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

[StatementInterceptors](#) are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property [statementInterceptors](#).

- See the sources (fully javadoc'd) for [com.mysql.jdbc.StatementInterceptor](#) for more details until we iron out the API and get it documented in the manual.
- Setting [rewriteBatchedStatements](#) to [true](#) now causes [CallableStatements](#) with batched arguments to be re-written in the form `CALL (...); CALL (...); ...` to send the batch in as few client/server round trips as possible.

D.6.1.16. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is [false](#) (that is, Connector/J does not use server-side prepared statements).

Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the [useTimezone=true](#) connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set [useSSPSCompatibleTimezoneShift=true](#).

Functionality added or changed:

- Refactored [CommunicationsException](#) into a JDBC-3.0 version, and a JDBC-4.0 version (which extends [SQLRecoverableException](#), now that it exists).

Note

This change means that if you were catching [com.mysql.jdbc.CommunicationsException](#) in your applications instead of looking at the [SQLState](#) class of [08](#), and are moving to Java 6 (or newer), you need to change your imports to that exception to be [com.mysql.jdbc.exceptions.jdbc4.CommunicationsException](#), as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized [SQLExceptions](#).
- Added support for JDBC-4.0's [NCLOB](#), and [NCHAR/NVARCHAR](#) types.
- [com.mysql.jdbc.java6.javac](#): Full path to your Java-6 [javac](#) executable
- Added support for JDBC-4.0's [SQLXML](#) interfaces.

- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- New feature—driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided using `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

D.6.2. Changes in MySQL Connector/J 5.0.x

D.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings`: Should the driver always treat BLOBS as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
 - `blobsAreStrings`: Should the driver always treat BLOBS as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBS` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBS` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

If the driver gives up, it will throw the last-received `SQLException`. ([Bug#31053](#))

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. ([Bug#30892](#))
- NPE with null column values when `padCharsWithSpace` is set to true. ([Bug#30851](#))

- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. ([Bug#30664](#))
- An `AritheticException` or `NullPointerException` would be raised when the batch had zero members and `re-writeBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. ([Bug#30550](#))
- Closing a load-balanced connection would cause a `ClassCastException`. ([Bug#29852](#))
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". ([Bug#29106](#))
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. ([Bug#28972](#))
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as `IN` parameters but permit callers to call `registerOutParameter()` on them without throwing an exception. ([Bug#28689](#))

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. ([Bug#28256](#))
- `UNSIGNED` types not reported using `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly using `DBMD.getColumns()`. ([Bug#27916](#))

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. ([Bug#27915](#))
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. ([Bug#27867](#))
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. ([Bug#27412](#))
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . ([Bug#27182](#))
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. ([Bug#21116](#))
- Specifying a "validation query" in your connection pool that starts with `/* ping */` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

D.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements to function.
- `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
- Give more information in EOFExceptions thrown out of MysqIO (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.

- `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to enable tuning of TCP/IP socket parameters:
 - `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
 - `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
 - `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpSndBuf` - Should the driver set SO SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that enable Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a Statement or ResultSet) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set SO SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. ([Bug#29605](#))
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. ([Bug#28956](#))
- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. ([Bug#28851](#))
- `PreparedStatement.getMetaData()` for statements containing leading one-line comments is not returned correctly.

As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECTs` for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. ([Bug#28469](#))

D.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at [ReplicationConnection](#) or [lbpool](#)).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...,host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.
- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

Note

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set with `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). ([Bug#28085](#))
- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. ([Bug#27655](#))
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). ([Bug#27655](#))
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

([Bug#27400](#))

- `ResultSet.get*()` with a column index < 1 returns misleading error message. ([Bug#27317](#))
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. ([Bug#27317](#))
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. ([Bug#26959](#))
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. ([Bug#26789](#))
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. ([Bug#26592](#))
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. ([Bug#26173](#))
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB, BIT, (VAR)BINARY, JAVA_OBJECT`) have extra 7 bytes. ([Bug#25715](#))
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. ([Bug#25624](#))
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. ([Bug#25545](#))
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. ([Bug#25517](#))
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. ([Bug#25328](#))

D.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or nonserver-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it is now configurable using `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed using correctly named mutator/Accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). ([Bug#26326](#))
- A query execution which timed out did not always throw a `MySQLTimeoutException`. ([Bug#25836](#))
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. ([Bug#25787](#))
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. ([Bug#25514](#))
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. ([Bug#25399](#))
- `INOUT` parameters in `CallableStatements` get doubly-escaped. ([Bug#25379](#))
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. ([Bug#25073](#))
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them using `ResultSetMetaData`. ([Bug#25073](#))
- `StringUtils.indexOfIgnoreCaseQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. ([Bug#25047](#))
- Client-side prepared statement parser gets confused by in-line comments `/* . . . */` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. ([Bug#25025](#))
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". ([Bug#25009](#))
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly.

Bug#24840)

- Using `DatabaseMetaData.getSQLKeywords()` does not return all of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. ([Bug#24794](#))
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). ([Bug#24721](#))
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. ([Bug#24360](#))
- Calendars and timezones are now lazily instantiated when required. ([Bug#24351](#))
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. ([Bug#24344](#))
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. ([Bug#24065](#))
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. ([Bug#23645](#))
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. ([Bug#23304](#))
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. ([Bug#23303](#))
- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). ([Bug#22628](#))
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. ([Bug#21480](#))
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. ([Bug#21438](#))
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). ([Bug#21438](#))
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). ([Bug#21267](#))
- Fixed an issue where `XADatasources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.

- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This enables us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, `TreeMaps` are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

D.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- DBMD.getColumns() does not return expected COLUMN_SIZE for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimiters to be consistent with the ODBC driver. ([Bug#22613](#))
- Added new _ci collations to CharsetMapping - utf8_unicode_ci not working. ([Bug#22456](#))
- Driver was using milliseconds for Statement.setQueryTimeout() when specification says argument is to be in seconds. ([Bug#22359](#))
- Workaround for server crash when calling stored procedures using a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). ([Bug#22297](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. ([Bug#22024](#))
- When using information_schema for metadata, COLUMN_SIZE for getColumns() is not clamped to range of `java.lang.Integer` as is the case when not using information_schema, thus leading to a truncation exception that isn't present when not using information_schema. ([Bug#21544](#))
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-to-1 mappings between `findColumn()` and `rsmd.getColumnName()`, usually manifests itself as "Can't find column ()" exceptions. ([Bug#21379](#))
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- DatabaseMetaData correctly reports `true` for `supportsCatalog*()` methods.
- Driver now supports `{call sp}` (without "() if procedure has no arguments).

D.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006 beta)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies using `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. ([Bug#20650](#))
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. ([Bug#20650](#))

D.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MysqlXaConnection.recover(int flags)` now permits combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere’s transaction manager. ([Bug#20242](#))
- Fixed `MysqlValidConnectionChecker` for JBoss doesn’t work with `MySQLXADataSources`. ([Bug#20242](#))
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This enables the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don’t maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). ([Bug#20242](#))
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. ([Bug#20242](#))
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. ([Bug#19169](#))
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL’s `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. ([Bug#18086](#))
- Fixed can’t use `XAConnection` for local transactions when no global transaction is in progress. ([Bug#17401](#))

D.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

This section has no changelog entries.

D.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration using url subprotocol `jdbc:mysql:mxj://....`. ([Bug#14729](#))
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. ([Bug#14729](#))
- When fix for [Bug#14562](#) was merged from 3.1.12, added functionality for `CallableStatement`’s parameter metadata to return correct information for `.getParameterClassName()`. ([Bug#14729](#))
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. ([Bug#14729](#))
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec permits it anyways), part of fix to [Bug#14972](#)). ([Bug#14729](#))
- Moved all `SQLException` constructor usage to a factory in `SQLError` (ground-work for JDBC-4.0 `SQLState`-based exception classes). ([Bug#14729](#))
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `' ', (int)0` was being used as an argument indirectly using method return value. This signature doesn’t exist prior to Java5.) ([Bug#14729](#))
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or

newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. ([Bug#14729](#))

- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). ([Bug#14729](#))
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, "`{ts ...}`" and "`{t ...}`").
- Do not permit `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADatasource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.optional.MysqlXADatasource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnName()` if the column was aliased, alias name for `.getColumnName()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for all `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

D.6.3. Changes in MySQL Connector/J 3.1.x

D.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. ([Bug#24840](#))

D.6.3.2. Changes in MySQL Connector/J 3.1.14 (19 October 2006)

Bugs fixed:

- Check and store value for `continueBatchOnError` property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause `NullPointerExceptions` when it is required to check this

property. ([Bug#22290](#))

- Fixed [Bug#18258](#) - DatabaseMetaData.getTables(), columns() with bad catalog parameter threw exception rather than return empty result set (as required by spec). ([Bug#22290](#))
- Driver now sends numeric 1 or 0 for client-prepared statement setBoolean() calls instead of '1' or '0'. ([Bug#22290](#))
- Fixed bug where driver would not advance to next host if roundRobinLoadBalance=true and the last host in the list is down. ([Bug#22290](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). ([Bug#22290](#))
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to STDERR. ([Bug#21207](#))
- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). ([Bug#21207](#))
- ResultSet.getSomeInteger() doesn't work for BIT(>1). ([Bug#21062](#))
- Escape of quotation marks in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO_BACKSLASH_ESCAPES being set, and stacked quote characters forms of escaping (that is, " or ""). ([Bug#20888](#))
- Fixed can't pool server-side prepared statements, exception raised when re-using them. ([Bug#20687](#))
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. ([Bug#20485](#))
- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. ([Bug#20479](#))
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. ([Bug#20306](#))
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. ([Bug#19993](#))
- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. ([Bug#19993](#))
- Connection fails to localhost when using timeout and IPv6 is configured. ([Bug#19726](#))
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX_VALUE. ([Bug#18880](#))
- Fixed memory leak with profileSQL=true. ([Bug#16987](#))
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddrs with null content. ([Bug#16791](#))

D.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- [Fixed PreparedStatement.setObject\(int, Object, int\)](#) doesn't respect scale of BigDecimals. ([Bug#19615](#))
- Fixed [ResultSet.wasNull\(\)](#) returns incorrect value when extracting native string from server-side prepared statement generated result set. ([Bug#19282](#))
- Fixed invalid classname returned for [ResultSetMetaData.getColumnClassName\(\)](#) for BIGINT type. ([Bug#19282](#))
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. ([Bug#19282](#))
- Fixed data truncation and [getWarnings\(\)](#) only returns last warning in set. ([Bug#18740](#))
- Fixed aliased column names where length of name > 251 are corrupted. ([Bug#18554](#))
- Improved performance of retrieving [BigDecimal](#), [Time](#), [Timestamp](#) and [Date](#) values from server-side prepared state-

ments by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. ([Bug#18496](#))

- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. ([Bug#18041](#))
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. ([Bug#18041](#))
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. ([Bug#17898](#))
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. ([Bug#17587](#))
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. ([Bug#17587](#))
- Added additional accessor and mutator methods on ConnectionProperties so that DataSource users can use same naming as regular URL properties. ([Bug#17587](#))
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done using conversion for server-side prepared statements. ([Bug#17450](#))
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. ([Bug#17099](#))
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). ([Bug#16841](#))
- `DBMD.getColumns()` returns wrong type for `BIT`. ([Bug#15854](#))
- `lib-nodist` directory missing from package breaks out-of-box build. ([Bug#15676](#))
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. ([Bug#15570](#))
- No "dos" character set in MySQL > 4.1.0. ([Bug#15544](#))
- `INOUT` parameter does not store `IN` value. ([Bug#15464](#))
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). ([Bug#15383](#))
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. ([Bug#14938](#))
- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](#))
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently . ([Bug#13601](#))
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. ([Bug#13469](#))
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. ([Bug#13469](#))

- LogFactory now prepends `com.mysql.jdbc.log` to the log class name if it cannot be found as specified. This enables you to use "short names" for the built-in log factories, for example, `logger=CommonsLogger` instead of `logger=com.mysql.jdbc.log.CommonsLogger`. ([Bug#13469](#))
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. ([Bug#11874](#))

D.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. ([Bug#15141](#))
- Usage advisor complains about unreferenced columns, even though they've been referenced. ([Bug#15065](#))
- Driver incorrectly closes streams passed as arguments to `PreparedStatement`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). ([Bug#15024](#))
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. ([Bug#14972](#))
- Unable to initialize character set mapping tables (due to J2EE classloader differences). ([Bug#14938](#))
- Escape processor replaces quote character in quoted string with string delimiter. ([Bug#14909](#))
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. ([Bug#14815](#))
- `storesMixedCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesLowerCaseIdentifiers()` returns `true` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `false` ([Bug#14562](#))
- `storesMixedCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`([Bug#14562](#))
- `storesUpperCaseIdentifiers()` returns `false` ([Bug#14562](#))
- `storesUpperCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`([Bug#14562](#))
- `storesLowerCaseQuotedIdentifiers()` returns `true` ([Bug#14562](#))
- Fixed `DatabaseMetaData.stores*Identifiers()`:
 - If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`

- `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
 - If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
 - `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)
 - Java type conversion may be incorrect for MEDIUMINT. (Bug#14562)
 - `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
 - Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
 - Extraneous sleep on `autoReconnect`. (Bug#13775)
 - Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
 - `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
 - OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
 - Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
 - `logSlowQueries` should give better info. (Bug#12230)
 - Don't increase timeout for failover/reconnect. (Bug#6577)
 - Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
 - Do not permit `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
 - Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

D.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now permits you to specify variables that start with the “@” sign. ([Bug#13453](#))
- URL configuration parameters do not permit “&” or “=” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>).
If the “%” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “%” when using application/x-www-form-urlencoded encoding. ([Bug#13453](#))
- Workaround for [Bug#13374](#): `ResultSet.createStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed using `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). ([Bug#13277](#))
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. ([Bug#13277](#))
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. ([Bug#13277](#))
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` is not technically permitted by the JDBC specification, but we have historically permitted it). ([Bug#13277](#))
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types. ([Bug#13277](#))
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. ([Bug#13277](#))
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. ([Bug#13043](#))
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. ([Bug#12970](#))
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. ([Bug#12970](#))
- Tokenizer for = in URL properties was causing `sessionVariables=....` to be parameterized incorrectly. ([Bug#12753](#))
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. ([Bug#12752](#))
- `getExportedKeys()` ([Bug#12541](#))
- Specifying a catalog works as stated in the API docs. ([Bug#12541](#))
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. ([Bug#12541](#))
- `getIndexInfo()` ([Bug#12541](#))
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) ([Bug#12541](#))
- `getImportedKeys()` ([Bug#12541](#))
- Specifying " " means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. ([Bug#12541](#))
- `getCrossReference()` ([Bug#12541](#))
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. ([Bug#12541](#))
- `getColumns()` ([Bug#12541](#))
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
 - `getBestRowIdentifier()`

- `getColumns()`
- `getCrossReference()`
- `getExportedKeys()`
- `getImportedKeys()`
- `getIndexInfo()`
- `getPrimaryKeys()`
- `getProcedures()` (and thus indirectly `getProcedureColumns()`)
- `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
- Specifying `" "` means "current" catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

([Bug#12541](#))

- `getBestRowIdentifier()` ([Bug#12541](#))
- Made `Connection.clientPrepare()` available from "wrapped" connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). ([Bug#12541](#))
- `getTables()` ([Bug#12541](#))
- `getPrimaryKeys()` ([Bug#12541](#))
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](#))
- `explainSlowQueries` hangs with server-side prepared statements. ([Bug#12229](#))
- Properties shared between master and slave with replication connection. ([Bug#12218](#))
- Geometry types not handled with server-side prepared statements. ([Bug#12104](#))
- `maxPerformance.properties` mis-spells "elideSetAutoCommits". ([Bug#11976](#))
- `ReplicationConnection` won't switch to slave, throws "Catalog can't be null" exception. ([Bug#11879](#))
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. ([Bug#11798](#))
- Escape tokenizer doesn't respect stacked single quotation marks for escapes. ([Bug#11797](#))
- `GEOMETRY` type not recognized when using server-side prepared statements. ([Bug#11797](#))
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. ([Bug#11781](#))
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. ([Bug#11781](#))
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters. ([Bug#11781](#))
- Fixed regression caused by fix for [Bug#11552](#) that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type. ([Bug#11663](#))
- Moved source code to Subversion repository. ([Bug#11663](#))

- Incorrect generation of testcase scripts for server-side prepared statements. ([Bug#11663](#))
- Fixed statements generated for testcases missing ; for “plain” statements. ([Bug#11629](#))
- Spurious ! on console when character encoding is `utf8`. ([Bug#11629](#))
- `String_Utils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. ([Bug#11614](#))
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. ([Bug#11575](#))
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. ([Bug#11498](#))
- Escape processor didn't honor strings demarcated with double quotation marks. ([Bug#11498](#))
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. ([Bug#11498](#))
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). ([Bug#11498](#))
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. ([Bug#11190](#))
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. ([Bug#11115](#))
- `Statement.getWarnings()` fails with NPE if statement has been closed. ([Bug#10630](#))
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. ([Bug#10630](#))

D.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.

D.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. ([Bug#11411](#))
- Removed nonsensical “costly type conversion” warnings when using usage advisor. ([Bug#11411](#))
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. ([Bug#11360](#))
- Connector/J dumping query into `SQLException` twice. ([Bug#11360](#))
- `autoReconnect` ping causes exception on connection startup. ([Bug#11259](#))
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. ([Bug#11115](#))
- `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality ([Bug#11115](#))
- `maxPerformance`: Maximum performance without being reckless ([Bug#11115](#))
- `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can ([Bug#11115](#))
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track

- of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. ([Bug#11115](#))
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. ([Bug#11115](#))
 - Added the following configuration bundles, use one or many using the `useConfigs` configuration property:
 - `maxPerformance`: Maximum performance without being reckless
 - `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can
 - `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality
 - ([Bug#11115](#))
 - Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a "Connection closed" exception that will also list the OOM exception as the reason for the implicit connection close event. ([Bug#10850](#))
 - Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. ([Bug#10850](#))
 - Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. ([Bug#10850](#))
 - 0-length streams not sent to server when using server-side prepared statements. ([Bug#10850](#))
 - Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. ([Bug#10850](#))
 - Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. ([Bug#10496](#))
 - Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. ([Bug#10496](#))
 - `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. ([Bug#10496](#))
 - The data type returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. ([Bug#10485](#))
 - `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTS`. ([Bug#10485](#))
 - Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. ([Bug#10310](#))
 - Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. ([Bug#10156](#))
 - Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. ([Bug#10155](#))
 - Double quotation marks not recognized when parsing client-side prepared statements. ([Bug#10155](#))
 - Made JDBC2-compliant wrappers public to enable access to vendor extensions. ([Bug#10155](#))
 - `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. ([Bug#10155](#))
 - Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. ([Bug#10155](#))
 - Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`.

Bug#10155)

- Actually write manifest file to correct place so it ends up in the binary jar file. ([Bug#10144](#))
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. ([Bug#10144](#))
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. ([Bug#10144](#))
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. ([Bug#9064](#))
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

D.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9917](#))
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. ([Bug#9778](#))
- Added a `Manifest.MF` file with implementation information to the `.jar` file. ([Bug#9778](#))
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. ([Bug#9778](#))
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. ([Bug#9778](#))
- Should accept `null` for name patterns in DBMD (meaning “%”), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9769](#))
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. ([Bug#9704](#))
- The logging system is now automatically configured. If the value has been set by the user, using the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
 1. Log4j, if it is available,
 2. Then JDK1.4 logging,
 3. Then fallback to our `STDERR` logging.

([Bug#9704](#))
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. ([Bug#9704](#))
- Stored procedures with `DECIMAL` parameters with storage specifications that contained “,” in them would fail. ([Bug#9682](#))
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. ([Bug#9682](#))
- Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the light-weight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. ([Bug#9320](#))
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. ([Bug#9320](#))
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared

statement can be prepared on the server or not. ([Bug#9320](#))

- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. ([Bug#9320](#))
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. ([Bug#9320](#))
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. ([Bug#9319](#))
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. ([Bug#9319](#))
- A continuation of [Bug#8868](#), where functions used in queries that should return nonstring types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n)` `CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnName()` and `ResultSet.getObject()`. ([Bug#9236](#))
- Cannot use `UTF-8` for characterSetResults configuration property. ([Bug#9206](#))
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. ([Bug#9040](#))
- `ServerPreparedStatements` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). ([Bug#8868](#))
- `DATE_FORMAT()` queries returned as `BLOBS` from `getObject()`. ([Bug#8868](#))
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. ([Bug#8868](#))
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. ([Bug#8868](#))
- Fixed regression in `ping()` for users using `autoReconnect=true`. ([Bug#8868](#))
- Check for empty strings (' ') when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyStringIsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). ([Bug#8803](#))
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). ([Bug#8803](#))
- `DBMD.supportsMixedCaseIdentifiers()` returns wrong value on servers running on case-sensitive file systems. ([Bug#8800](#))
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). ([Bug#8792](#))
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

D.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatement` not creating streaming result sets. ([Bug#8487](#))
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. ([Bug#8487](#))
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. ([Bug#8428](#))

- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). ([Bug#8428](#))
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. ([Bug#8424](#))
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. ([Bug#8424](#))
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. ([Bug#8424](#))
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if nonrounding `BigDecimal.setScale()` fails. ([Bug#8424](#))
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. ([Bug#8096](#))
- Emulated locators corrupt binary data when using server-side prepared statements. ([Bug#8096](#))
- Infinite recursion when “falling back” to master in failover configuration. ([Bug#7952](#))
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. ([Bug#7952](#))
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. ([Bug#7952](#))
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. ([Bug#7952](#))
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton). ([Bug#7715](#))
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. ([Bug#7715](#))
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. ([Bug#7715](#))
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](#))
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`. ([Bug#4718](#))
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. ([Bug#4718](#))
- Always return `byte[]`s for output parameters registered as `*BINARY`. ([Bug#4718](#))
- By default, the driver now scans SQL you are preparing using all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPsts=false` in your JDBC URL. ([Bug#4718](#))
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for nonwell-behaved apps (that is, applications that don't close `Statement` objects when they should). ([Bug#4718](#))
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. ([Bug#4718](#))
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. ([Bug#4718](#))

D.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. ([Bug#7026](#))
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

D.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is <`max_allowed_packet` on server. ([Bug#6537](#))
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). ([Bug#6537](#))
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. ([Bug#6537](#))
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. ([Bug#6399](#))
- Make auto-deserialization of `java.lang.Object`s stored in `BLOB` columns configurable using `autoDeserialize` property (defaults to `false`). ([Bug#6399](#))
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. ([Bug#6399](#))
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. ([Bug#6399](#))
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. ([Bug#6348](#))
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for [Bug#6359](#). ([Bug#6225](#))
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. ([Bug#6225](#))
- Use null-safe-equals for key comparisons in updatable result sets. ([Bug#6225](#))
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for [Bug#6359](#). ([Bug#6225](#))
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. ([Bug#5729](#))
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for nonnumeric values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. ([Bug#5706](#))
- Don't throw exceptions for `Connection.releaseSavepoint()`. ([Bug#5706](#))
- Inefficient detection of pre-existing string instances in `ResultSet.getString()`. ([Bug#5706](#))
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). ([Bug#5706](#))
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql_stmt_execute()”. ([Bug#5235](#))
- Handle case when string representation of timestamp contains trailing “.” with no numbers following it. ([Bug#5235](#))
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. ([Bug#5235](#))
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtil.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

D.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsException`. ([Bug#5032](#))
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet:exception` (the default), which throws an `SQLException` with an SQLState of `S1009; convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is '`0001-01-01`'. ([Bug#5032](#))
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). ([Bug#5032](#))
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. ([Bug#5032](#))
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). ([Bug#5032](#))
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. ([Bug#5032](#))
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. ([Bug#5012](#))
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. ([Bug#4689](#))
- `ResultSet.wasNull()` does not work for primitives if a previous `null` was returned. ([Bug#4689](#))
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes using `useFastIntParsing=false` property. ([Bug#4642](#))
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's "standard" description, followed by the server's error message). This property is set to `true` by default. ([Bug#4642](#))
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. ([Bug#4642](#))
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt() -> Buffer.readShort()`). ([Bug#4510](#))
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. ([Bug#4510](#))
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. ([Bug#4482](#))
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. ([Bug#4482](#))

D.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. ([Bug#4311](#))
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. ([Bug#4311](#))
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. ([Bug#4311](#))
- Externalized more messages (on-going effort). ([Bug#4119](#))

- Null bitmask sent for server-side prepared statements was incorrect. ([Bug#4119](#))
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). ([Bug#4119](#))
- Added packet debugging code (see the `enablePacketDebug` property documentation). ([Bug#4119](#))
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. ([Bug#4119](#))
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

D.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). ([Bug#3804](#))
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. ([Bug#3804](#))
- `getProcedureColumns()` doesn't work with wildcards for procedure name. ([Bug#3540](#))
- `getProcedures()` does not return any procedures in result set. ([Bug#3539](#))
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1). ([Bug#3520](#))
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. ([Bug#3520](#))
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](#))
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. ([Bug#3146](#))
- Cleaned up detection of server properties. ([Bug#3146](#))
- Correctly detect initial character set for servers >= 4.1.0. ([Bug#3146](#))
- Support placeholder for parameter metadata for server >= 4.1.2. ([Bug#3146](#))
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching using `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

D.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004 alpha)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. ([Bug#2671](#))
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. ([Bug#2671](#))
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. ([Bug#2671](#))
- Fixed `ConnectionProperties` that weren't properly exposed through accessors, cleaned up `ConnectionProperties` code. ([Bug#2623](#))
- Class-cast exception when using scrolling result sets and server-side prepared statements. ([Bug#2623](#))
- Merged unbuffered input code from 3.0. ([Bug#2623](#))
- Enabled streaming of result sets from server-side prepared statements. ([Bug#2606](#))
- Server-side prepared statements were not returning data type `YEAR` correctly. ([Bug#2606](#))
- Fixed charset conversion issue in `getTables()`. ([Bug#2502](#))
- Implemented multiple result sets returned from a statement or stored procedure. ([Bug#2502](#))
- Implemented `Connection.prepareStatement()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. ([Bug#2359](#))
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. ([Bug#2359](#))
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. ([Bug#2359](#))
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. ([Bug#2359](#))
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. ([Bug#2359](#))
- Display where/why a connection was implicitly closed (to aid debugging). ([Bug#1673](#))
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'%' column name patterns. ([Bug#1673](#))
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp(), setDate()`. ([Bug#1673](#))
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. ([Bug#1673](#))
- Fixed sending of queries larger than 16M. ([Bug#1673](#))
- Merged fix of data type mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. ([Bug#1673](#))
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. ([Bug#1673](#))
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. ([Bug#1673](#))
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. ([Bug#1673](#))
- Detect collation of column for `RSMD.isCaseSensitive()`. ([Bug#1673](#))
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support

warnings).

- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clob, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions $\geq 5.0.0$.
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL $\geq 4.0.14$ or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn’t provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessException` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `Data-Source` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

D.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003 alpha)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

D.6.4. Changes in MySQL Connector/J 3.0.x

D.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server [Bug#9098](#): Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can’t be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for

inserting default values. ([Bug#8812](#))

- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. ([Bug#8812](#))
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. ([Bug#8629](#))
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `euc_jpms` (backported from 3.1 branch). This only works on servers that support `euc_jpms`, namely 5.0.3 or later. ([Bug#8629](#))
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. ([Bug#8629](#))
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. ([Bug#8629](#))
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. ([Bug#8064](#))
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. ([Bug#7952](#))
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). ([Bug#7686](#))
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](#))
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. ([Bug#7607](#))
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. ([Bug#7601](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7601](#))
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`. ([Bug#7601](#))
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. ([Bug#7316](#))
- Support new protocol type `MYSQL_TYPE_VARCHAR`. ([Bug#7081](#))
- Added `useOldUTF8Behavior`' configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. ([Bug#7081](#))
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. ([Bug#7081](#))
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. ([Bug#7061](#))
- `PreparedStatement`s don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. ([Bug#7033](#))
- Connections starting up failed-over (due to down master) never retry master. ([Bug#6966](#))
- Adding `CP943` to aliases for `sjis`. ([Bug#6549](#), [Bug#7607](#))
- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. ([Bug#5874](#))

D.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1) -> BIT/Boolean` conversion configurable using `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box). ([Bug#5664](#))
- Off-by-one bug in `Buffer.readString(string)`. ([Bug#5664](#))
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. ([Bug#5664](#))
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. ([Bug#5664](#))

- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. ([Bug#5664](#))
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, nonnegative) scale for the `NUMERIC` type. ([Bug#5664](#))
- Only set `character_set_results` during connection establishment if server version >= 4.1.1. ([Bug#5664](#))
- Fixed `ResultSetMetaData.isReadOnly()` to detect nonwritable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- Re-issue character set configuration commands when re-using pooled connections or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

D.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. ([Bug#5069](#))
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. ([Bug#5069](#))
- Parse new time zone variables from 4.1.x servers. ([Bug#5069](#))
- `ResultSet` should release `Field[]` instance in `.close()`. ([Bug#5022](#))
- `RSMD.getPrecision()` returning 0 for nonnumeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). ([Bug#4880](#))
- “Production” is now “GA” (General Availability) in naming scheme of distributions. ([Bug#4860](#), [Bug#4138](#))
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. ([Bug#4860](#), [Bug#4138](#))
- Calling `.close()` twice on a `PooledConnection` causes NPE. ([Bug#4808](#))
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. ([Bug#4742](#))
- Added FLOSS license exemption. ([Bug#4742](#))
- Removed redundant calls to `checkRowPos()` in `ResultSet`. ([Bug#4334](#))
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

Warning

This required a change to the `SocketFactory.connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

([Bug#4334](#))

- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. ([Bug#4334](#))
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. ([Bug#4010](#))

D.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

D.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. ([Bug#3920](#))
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. ([Bug#3873](#))
- Using a `MySQLDatasource` without server name fails. ([Bug#3848](#))

D.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBS *TEXT correctly, so the driver won't return those correctly. ([Bug#3570](#))
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. ([Bug#3557](#))
- Not specifying database in URL caused `MalformedURL` exception. ([Bug#3554](#))
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. ([Bug#3554](#))
- Use `junit.textui.TestRunner` for all unit tests (to enable them to be run from the command line outside of Ant or Eclipse). ([Bug#3554](#))
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. ([Bug#3554](#))
- Made `StringRegressionTest` 4.1-unicode aware. ([Bug#3520](#))
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. ([Bug#3520](#))
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](#))
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. ([Bug#3511](#))
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. ([Bug#3511](#))
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. ([Bug#2957](#))
- Use `SET character_set_results` during initialization to enable any charset to be returned to the driver for result sets. ([Bug#2670](#))
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and `setBinary/CharacterStream()`. ([Bug#2670](#))
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. ([Bug#2670](#))
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers >= 4.1.2. ([Bug#2670](#))
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL >= 4.1.0. ([Bug#2670](#))
- Add helper methods to `ResultSetMetaData.getColumnCharacterEncoding()` and `getColumnCharacterSet()` to permit end users to see what charset the driver thinks it should be using for the column. ([Bug#2670](#))
- Only set `character_set_results` for MySQL >= 4.1.0. ([Bug#2670](#))
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPoolDataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.

- Added `failOverReadOnly` property, to enable the user to configure the state of the connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. . ([Bug#103](#))
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to SQLState of `23000`.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to enable clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

D.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. ([Bug#2855](#))
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). ([Bug#2855](#))
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. ([Bug#2855](#))
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. ([Bug#2852](#))
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue [ht tp://developer.java.sun.com/developer/bugParade/bugs/4401235.html](http://developer.java.sun.com/developer/bugParade/bugs/4401235.html)) ([Bug#2578](#))
- Fixed failover always going to last host in list. ([Bug#2578](#))
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server. ([Bug#2578](#))
- `AutoReconnect` time was growing faster than exponentially. ([Bug#2447](#))
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8 or utf-8` using the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

D.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements using the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). ([Bug#2006](#))
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). ([Bug#2006](#))
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. ([Bug#2006](#))
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 ([Bug#2006](#))
- Fixed mappings in `SQLError` to report deadlocks with SQLStates of `41000`. ([Bug#2006](#))
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. ([Bug#2006](#))
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. ([Bug#2006](#))
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). ([Bug#2006](#))
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. ([Bug#2006](#))
- Use constants for SQLStates. ([Bug#2006](#))

- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. ([Bug#2006](#))
- Ensure that `Buffer.writeString()` saves room for the `\0`. ([Bug#2006](#))
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. ([Bug#1958](#))
- Connection property `maxRows` not honored. ([Bug#1933](#))
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. ([Bug#1925](#))
- Support escape sequence {fn convert ...}. ([Bug#1914](#))
- Implement `ResultSet.updateClob()`. ([Bug#1913](#))
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. ([Bug#1913](#))
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. ([Bug#1913](#))
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. ([Bug#1913](#))
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns. ([Bug#1913](#))
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. ([Bug#1913](#))
- `DatabaseMetaData.getSystemFunction()` returning bad function `vResultsSion`. ([Bug#1775](#))
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. ([Bug#1731](#))
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. ([Bug#1695](#))
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. ([Bug#1630](#))
- Fix for 4.1.1-style authentication with no password. ([Bug#1630](#))
- Cross-database updatable result sets are not checked for updatability correctly. ([Bug#1592](#))
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. ([Bug#1592](#))
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. ([Bug#1576](#))
- Barge blobs and split packets not being read correctly. ([Bug#1576](#))
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. ([Bug#1534](#))
- “Friendlier” exception message for `PacketTooLargeException`. ([Bug#1534](#))
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. ([Bug#1511](#))

D.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.get/setString` mashing char 127. ([Bug#1247](#))
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. ([Bug#1247](#))
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. ([Bug#1247](#))
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. ([Bug#1247](#))
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. ([Bug#1246](#))
- Optimized `CLOB.setCharacterStream()`. ([Bug#1131](#))

- Fixed `CLOB.truncate()`. ([Bug#1130](#))
- Fixed deadlock issue with `Statement.setMaxRows()`. ([Bug#1099](#))
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. ([Bug#1099](#))
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. ([Bug#884](#))
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. ([Bug#884](#))
- Double-escaping of '\' when charset is SJIS or GBK and '\' appears in nonescaped input. ([Bug#879](#))
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows to not monopolize CPU time. ([Bug#879](#))
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases). ([Bug#848](#))
- Don't hide messages from exceptions thrown in I/O layers. ([Bug#848](#))
- Fixed regression in large split-packet handling. ([Bug#848](#))
- Better diagnostic error messages in exceptions for “streaming” result sets. ([Bug#848](#))
- Don't change timestamp TZ twice if `useTimezone==true`. ([Bug#774](#))
- Don't wrap `SQLExceptions` in `RowDataDynamic`. ([Bug#688](#))
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. ([Bug#688](#))
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. ([Bug#688](#))
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. ([Bug#688](#))
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). ([Bug#688](#))
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. ([Bug#675](#))
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). ([Bug#664](#), [Bug#517](#))
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). ([Bug#664](#), [Bug#517](#))
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). ([Bug#661](#))
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. ([Bug#496](#))
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. ([Bug#496](#))
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

D.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. ([Bug#378](#))
- Fix problem detecting server character set in some cases. ([Bug#378](#))

- Allow multiple calls to `Statement.close()`. ([Bug#378](#))
- Return correct number of generated keys when using `REPLACE` statements. ([Bug#378](#))
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. ([Bug#378](#))
- Fix row data decoding error when using *very* large packets. ([Bug#378](#))
- Optimized row data decoding. ([Bug#378](#))
- Issue exception when operating on an already closed prepared statement. ([Bug#378](#))
- Optimized usage of `EscapeProcessor`. ([Bug#378](#))
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Allow bogus URLs in `Driver.getPropertyInfo()`.

D.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of 0x5c ('\') character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

D.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for "non transactional tables" during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not permitted with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support "locators".
- Add "window" of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

D.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.

D.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatements` by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to enable control of amount of checking for "correctness" of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with

primary keys and that you have selected all primary keys in your query.

- Added support for quoted identifiers in [PreparedStatement](#) parser.

D.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of [Statement](#)/[PreparedStatement](#).[executeBatch\(\)](#) using [continueBatchOnError](#) property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and permit nested escape sequences (see [test-suite.EscapeProcessingTest](#)).
- Fixed [Buffer](#).[isLastDataPacket\(\)](#) for 4.1 and newer servers.
- [NamedPipeSocketFactory](#) now works (only intended for Windows), see [README](#) for instructions.
- Changed [charsToByte](#) in [SingleByteCharConverter](#) to be nonstatic.
- Use nonaliased table/column names and database names to fully qualify tables and columns in [UpdatableResultSet](#) (requires MySQL-4.1 or newer).
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to permit it. Can be turned off with the [allowLoadLocalInfile](#) property (see the [README](#)).
- Implemented [Connection](#).[nativeSQL\(\)](#).
- Fixed [ResultSetMetaData](#).[getColumnTypeName\(\)](#) returning [BLOB](#) for [TEXT](#) and [TEXT](#) for [BLOB](#) types.
- Fixed charset handling in [Fields.java](#).
- Because of above, implemented [ResultSetMetaData](#).[isAutoIncrement\(\)](#) to use [Field](#).[isAutoIncrement\(\)](#).
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Added [CLIENT_LONG_FLAG](#) to be able to get more column flags ([isAutoIncrement\(\)](#) being the most important).
- Honor [lower_case_table_names](#) when enabled in the server when doing table name comparisons in [DatabaseMetaData](#) methods.
- [DBMD](#).[getImported/ExportedKeys\(\)](#) now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more [Connection](#) methods ([createStatement](#), [prepareStatement](#), [setTransactionIsolation](#), [setAutoCommit](#)).
- Fixed [ResultSetMetaData](#).[getPrecision\(\)](#) returning incorrect values for some floating-point types.
- Changed [SingleByteCharConverter](#) to use lazy initialization of each converter.

D.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented [Clob](#).[setString\(\)](#).
- Added [com.mysql.jdbc.MiniAdmin](#) class, which enables you to send [shutdown](#) command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See [README](#) for information on how to use it.
- All [DBMD](#) result set columns describing schemas now return [NULL](#) to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).

- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also enables cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding using properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatement`s not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that enables users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

D.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getValueAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).

- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getBlob()`, `PreparedStatement.setBlob()`, `PreparedStatement.setObject(Clob)`).
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as host names, ports, or user names), as well as clearing “sensitive” data structures when possible.

D.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.
- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see [README](#)).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements using controlling transient object creation in `MysqlIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me <mark@mysql.com>.
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

D.6.5. Changes in MySQL Connector/J 2.0.x

D.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).

- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `-sql-mode=ANSI_QUOTES`, “`”` will be used as an identifier quote character, otherwise “`‘`” will be used.

D.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PreparedStatement`.
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

D.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `testsuite.Traversal.afterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect auto_increment fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.

- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

D.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

D.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).

D.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADatasource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

D.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADatasource/ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).

- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds + so MySQL can understand it).

D.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

D.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

D.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.

- `ResultSet` has +/-Inf/inf support.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob() ArrayIndex` out-of-bounds.

D.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of -/+INF for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to enable (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

D.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cesar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

D.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

D.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- Statement/PreparedStatement.getMoreResults() bug fixed. Thanks to Noel J. Bergman.
- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

D.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

D.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now permits null for a column name pattern (not in spec), which it changes to '%'.
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotation marks correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character-converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to {} inside quotation marks.

D.6.7. Changes in MySQL Connector/J 1.2.x and lower

D.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)

- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

D.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

D.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

D.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

D.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values using setObject() (code from Robert Currey).

- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets.
(Pointed out by Samo Login)

D.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

D.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set using properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value using "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

D.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

D.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

D.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that enables executeUpdate() to store values for IDs that are automatically generated for AUTO_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO_INCREMENT fields in your tables and are executing a lot of executeUpdate()s on one Statement, be sure to clearWarnings() every so often to save memory.

D.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccessException for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

D.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

D.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
 - `getTables()`
 - `getTableTypes()`
 - `getColumns()`
 - `getCatalogs()`

D.7. MySQL Connector/MXJ Change History

D.7.1. Changes in MySQL Connector/MXJ 5.0.11 (24th November 2009)

Functionality added or changed:

- The embedded MySQL binaries have been updated to MySQL 5.1.40 for GPL releases and MySQL 5.1.40 for Commercial releases.
- The contents of the directory used for bootstrapping the MySQL databases is now configurable by using the `windows-share-dir-jar` property. You should supply the name of a jar containing the files you want to use.
- The embedded Aspect/J class has been removed.
- The default timeout for the kill delay within the embedded test suite has been increased from 10 to 30 seconds.

Bugs fixed:

- On startup Connector/MXJ generated an exception on Windows 7:

```
Exception in thread "Thread-3" java.util.MissingResourceException?: Resource
'5-0-51a/Windows_7-x86/mysqld-nt.exe' not found
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:133)
at com.mysql.management.util.Streams.getResourceAsStream(Streams.java:107)
at com.mysql.management.util.Streams$1.inner(Streams.java:149) at
com.mysql.management.util.Exceptions$VoidBlock?.exec(Exceptions.java:128)
at com.mysql.management.util.Streams.createFileFromResource(Streams.java:162)
at com.mysql.management.MysqldResource?.makeMysqld(MysqldResource?.java:533)
at com.mysql.management.MysqldResource?.deployFiles(MysqldResource?.java:518)
at com.mysql.management.MysqldResource?.exec(MysqldResource?.java:495)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:216)
at com.mysql.management.MysqldResource?.start(MysqldResource?.java:166)
```

The default `platform-map.properties` file, which maps platforms to the supplied binary bundles, has been updated with additional platforms, including Windows 7, Windows Server 2008, `amd64` and `sparcv9` for Solaris, and Mac OS X 64-bit. ([Bug#48298](#))

D.7.2. Changes in MySQL Connector/MXJ 5.0.10 (Never released)

This was an internal only release.

Functionality added or changed:

- The embedded MySQL has been updated to the MySQL 5.1 series. The embedded MySQL binaries have been updated to MySQL 5.1.33 for GPL releases and MySQL 5.1.34 for Commercial releases.
- The MySQL binary for Windows targets has been updated to be configurable through the `windows-mysqld-command` property. This is to handle the move in MySQL 5.1.33 from `mysqld-nt.exe` to `mysqld.exe`. The default value is `mysqld.exe`.

D.7.3. Changes in MySQL Connector/MXJ 5.0.9 (19 August 2008)

Functionality added or changed:

- The port used in the `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` port is no longer hard coded. Instead, the code uses the `x-mxj-test-port` property a default value of 3336
- The utility used to kill MySQL on Windows (`kill.exe`) has been configured to be loaded from the `kill.exe` property, instead of being hard-coded. The corresponding timeout, `KILL_DELAY` has also been moved to the properties file and defaults to 5 minutes.
- The embedded MySQL binaries have been updated to MySQL 5.0.51a for GPL releases and MySQL 5.0.54 for Commercial releases.
- The timeout for kill operations in the embedded test suite has been set to a default of 10 seconds.

D.7.4. Changes in MySQL Connector/MXJ 5.0.8 (06 August 2007)

Functionality added or changed:

- The embedded documentation has been updated so that it now points to the main MySQL documentation pages in the MySQL reference manual.
- The embedded MySQL binaries have been updated to MySQL 5.0.45 for GPL releases and MySQL 5.0.46 for Commercial releases.

D.7.5. Changes in MySQL Connector/MXJ 5.0.7 (27 May 2007)

Functionality added or changed:

- Updated the jar filename to be consistent with the Connector/J jar filename. Files are now formatted as `mysql-connector-mxj-mxj-version`.
- The `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExammpale` have been updated to include an example of initializing the user/password and creating an initial database. The `InitializePasswordExample` example class has now been removed.
- The `PatchedStandardSocketFactory` class has been removed, because it fixed an issue in Connector/J that was corrected in Connector/J 5.0.6.
- The embedded MySQL binaries have been updated to MySQL 5.0.41 for GPL releases and MySQL 5.0.42 for Commercial releases.

Bugs fixed:

- Added a null-check to deal with class loaders where `getClassLoader()` returns null.

D.7.6. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, `connector-mxj.jar` is now `mysql-connector-mxj-$\{mxj-version\}.jar`.
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added `InitializeUser` and `QueryUtil` classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- `ConnectorMXJUrlTestExample` and `ConnectorMXJObjectTestExample` now demonstrate the initialization of user/password and creating the initial database (rather than using "test").
- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.

- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be written to datadir.
- Added os.name-os.arch to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preparation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connector/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

D.7.7. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)
- `build.xml:usage` now slightly more verbose; some reformatting.
- Now incorporates Reggie Bennett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes a bug where mysqld was being force terminated. Issue reported by bruno halebian and others, see: [MySQL Forums](#).
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default mysql version to 5.0.37.
- In testing so far mysqld reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.

- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand to enable setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to mysqld.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out gpl binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

D.7.8. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. ([Bug#24004](#))
- Updated `build.xml` to build to handle with different gpl and commercial mysld version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out gpl binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved mysqld binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.
- Fixed test to be tollerant of `/tmp` being a symlink to `/foo/tmp`.

D.7.9. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

D.7.10. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to `ListToString` utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust by deleting the `/tmp/test-c.mxj` directory before running tests.
- `ServerLauncherSocketFactory.shutdown` API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- `MysqldResource` now tied to `dataDir` as well as `basedir` (API CHANGE)
- moved PID file into datadir
- `ServerLauncherSocketFactory.shutdown` now works across JVMs.
- extracted `splitLines(String)` to `Str` utility class
- `ServerLauncherSocketFactory.shutdown(port)` no longer throws, only reports to `System.err`
- `ServerLauncherSocketFactory` now treats URL parameters in the form of `&server.foo=null` as `serverOptions-Map.put("foo", null)`
- `ServerLauncherSocketFactory.shutdown` API change: now takes 2 File parameters (basedir, datadir)

D.7.11. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

This section has no changelog entries.

D.7.12. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed `HelpOptionsParser`'s need to reference a `MysqldResource`.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks

- Altered examples and tests to use new Connector/J 5.0 URL syntax for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with Str).
- Minor refactorings for type casting and exception handling.

D.8. MySQL Connector/C++ Change History

D.8.1. Changes in MySQL Connector/C++ 1.1.x

D.8.1.1. Changes in MySQL Connector/CPP 1.1.0 (13th September 2010 GA)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

Functionality added or changed:

- **Incompatible Change:** API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a `typedef` that uses `boost::variant`. Code such as:

```
sql::ConnectPropertyVal tmp;
tmp.str.val=passwd.c_str();
tmp.str.len=passwd.length();
connection_properties["password"] = tmp;
```

Should be changed to:

```
connection_properties["password"] = sql::ConnectPropertyVal(passwd);
```

- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use `boost::scoped_array`. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.
- `LDFLAGS`, `CXXFLAGS` and `CPPFLAGS` are now checked from the environment for every binary generated.
- Connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.
- `get_driver_instance()` is now only available in dynamic library builds - static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use `CMake` for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.
- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was permitted. The same options are available for `Connection::setClientOption()`.

Bugs fixed:

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. ([Bug#45846](#))
- `CMake` generated an error if configuring an out of source build, that is, when `CMake` was not called from the source root directory. ([Bug#45843](#))
- Using Prepared Statements caused corruption of the heap. ([Bug#45048](#))
- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official MySQL Connector/C++ builds. ([Bug#44931](#))
- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. ([Bug#44931](#))
- Fixed a Prepared Statements performance issue. Reading large result sets was slow.

- Fixed bug in `ResultSetMetaData` for statements and prepared statements, `getScale` and `getPrecision` returned incorrect results.

D.8.2. Changes in MySQL Connector/C++ 1.0.x

D.8.2.1. Changes in MySQL Connector/CPP 1.0.5 (21 April 2009)

This is the first Generally Available (GA) release.

Functionality added or changed:

- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

```
connection->getMetaData->getSchema();
```

This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.

- Improved memory management. Potential memory leak situations are handled more robustly.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Added `Result::getType()`. Implemented for the three result set classes.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.

Bugs fixed:

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

D.8.2.2. Changes in MySQL Connector/CPP 1.0.4 (31 March 2009 beta)

Functionality added or changed:

- An installer was added for the Windows operating system.
- Minimum `CMake` version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- `metadataUseInfoSchema` was added to the connection property map, which enables control of the `INFORMATION_SCHEMA` for metadata.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- Added support for MySQL Connector/C.
- Introduced `ResultSetMetaData::isZeroFill()`, which is not in the JDBC specification.

Bugs fixed:

- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.
- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.

D.8.2.3. Changes in MySQL Connector/CPP 1.0.3 (02 March 2009 alpha)

Functionality added or changed:

- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGNED, DECIMAL UNSIGNED, DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- `MySQL_Driver::getPatchVersion` introduced.
- Major performance improvements due to new buffered `ResultSet` implementation.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- New BLOB implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `Iostream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istringstream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- `make package_source` now packs with bzip2.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the metadata functions will be faster.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typdefs for Windows to be able to use `int64_t`.

- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.

Bugs fixed:

- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.
- Corrected handling of unsigned server types. Now returning correct values.
- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.

D.8.2.4. Changes in MySQL Connector/CPP 1.0.2 (19 December 2008 alpha)

Functionality added or changed:

- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultMetaData` and `MySQL_Prepared_ResultMetaData`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_ResultMetaData::getPrecision()` and `MySQL_Prepared_ResultMetaData::getPrecision()`, updating example.
- Added new unit test framework for JDBC compliance and regression testing.
- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.

Bugs fixed:

- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.
- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.
- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXX` returns `false` and `supportsSchemaXXXX` returns `true`.

- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed a bug in `getString().getString()` is now binary safe. A new example was also added.
- Fixed bug in `FLOAT` handling.
- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.

D.8.2.5. Changes in MySQL Connector/CPP 1.0.1 (01 December 2008 alpha)

Functionality added or changed:

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked to evaluate the error type.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
 - Static and the dynamic version of the library, `libmysqlcppconn`.
 - Generic interface, `cppconn`.
 - Two MySQL specific headers:

`mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

`mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

However, you can make your application fully abstract by using the generic interface rather than these two headers.

- Driver Manager was removed.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- All examples can be given optional connection parameters on the command line, for example:

```
examples/connect tcp://host:port user pass database
```

or

```
examples/connect unix:///path/to/mysql.sock user pass database
```

- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JD-BC compliance.
- Introduced experimental CPack support, see make help.

- All tests changed to create TAP compliant output.
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- Renamed `sql::DbcInvalidArgumentException` to `sql::InvalidArgumentException`
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Converted Connector/J tests added.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- New directory layout.

D.9. MySQL Proxy Change History

D.9.1. Changes in MySQL Proxy 0.8.1 (13 September 2010)

Functionality added or changed:

- Allow interception of `LOAD DATA INFILE` and `SHOW ERRORS` statements.
- The unused `network_mysqld_com_query_result_track_state()` function has been deprecated.
- `chassis_set_fdlimit()` has been deprecated in favor of `chassis_fdlimit_set()`.
- Shutdown hooks were added to free the global memory of third-party libraries such as `openssl`.
- `con->in_load_data_local` has been removed.

Bugs fixed:

- The admin plugin had an undocumented default value for `--admin-password`. ([Bug#53429](#))
- Use of `LOAD DATA LOCAL INFILE` caused the connection between the client and MySQL Proxy to abort. ([Bug#51864](#))
- If the backend MySQL server went down, and then the clock on the MySQL Proxy host went backward (for example, during daylight saving time adjustments), Proxy stopped forwarding queries to the backend. ([Bug#50806](#))
- `network_address_set_address() -> network_address_set_address_ip()` called `gethostbyname()` which was not reentrant. This meant that a MySQL Proxy plugin needed to guard all calls to `net-work_address_set_address()` with a mutex. `network_address_set_address()` has been modified to be thread safe. ([Bug#49099](#))
- The hard limit was fixed for the case where the fdlimit was set. ([Bug#48120](#))
- MySQL Proxy returned an error message with a nonstandard SQL State when all backends were down:

```
"#07000(proxy) all backends are down"
```

This caused issues for clients with “retry” logic, as they could not handle these “custom” SQL States. ([Bug#45417](#))

- If MySQL Proxy used a UNIX socket, it did not remove the socket file at termination time. ([Bug#38415](#))
- When running `configure` to build, the error message relating to the `lua` libraries could be misleading. The wording and build advice have been updated.

D.9.2. Changes in MySQL Proxy 0.8.0 (21 January 2010)

Functionality added or changed:

- The `--no-daemon` has been renamed to The `--daemon`. By default, MySQL Proxy now starts in foreground mode. Use the `--daemon` option to override this and start in daemon mode.

Bugs fixed:

- A memory leak occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. ([Bug#50993](#))
 - A segmentation fault occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. ([Bug#48641](#))
 - MySQL Proxy would load a configuration file with unsafe permissions, which could permit password information to be exposed through the file. MySQL Proxy now refuses to load a configuration file with unsafe permissions. ([Bug#47589](#))
 - Several supplied scripts were updated to account for flag and structure changes:
 - `active-transactions.lua` was updated to use the `resultset_is_needed` flag.
 - `ro-balance.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connection.dst.name` structure.
 - `rw-splitting.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connections` structure.
- ([Bug#47349](#), [Bug#45408](#), [Bug#47345](#), [Bug#43424](#), [Bug#42841](#), [Bug#46141](#))
- The line numbers provided in stack traces were off by one. ([Bug#47348](#))
 - MySQL Proxy accepted more than one address in the value of the `--proxy-backend-addresses` option. You should specify one `--proxy-backend-addresses` option for each backend address. ([Bug#47273](#))
 - MySQL Proxy returned the wrong version string internally from the `proxy.PROXY_VERSION` constant. ([Bug#45996](#))
 - MySQL Proxy could stop accepting network packets if it received a large number of packets. The listen queue has been extended to permit a larger backlog. ([Bug#45878](#), [Bug#43278](#))
 - Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. ([Bug#45272](#))
 - MySQL Proxy failed to work with certain versions of MySQL, including MySQL 5.1.15, where a change in the MySQL protocol existed. Now Proxy denies `COM_CHANGE_USER` commands when it is connected to MySQL 5.1.14 to 5.1.17 servers by sending back an error: `COM_CHANGE_USER is broken on 5.1.14-.17, please upgrade the MySQL Server.` ([Bug#45167](#))

See also [Bug#25371](#).

- Logging to `syslog` with the `--log-use-syslog` option did not work. ([Bug#36431](#))
- MySQL Proxy could incorrectly insert `NULL` values into the returned result set, even though non-`NULL` values were returned in the original query. ([Bug#35729](#))
- MySQL Proxy raised an error when processing query packets larger than 16MB. ([Bug#35202](#))

D.9.3. Changes in MySQL Proxy 0.7.2 (30 June 2009)

Bugs fixed:

- On Windows, MySQL Proxy might not find the required modules during initialization. The core code has been updated to find the components correctly, and the Lua-based C modules are prefixed with `lua-` and Lua plugins with `plugin-`. ([Bug#45833](#))

D.9.4. Changes in MySQL Proxy 0.7.1 (15 May 2009)

Bugs fixed:

- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. ([Bug#45272](#))
- The port number was reported incorrectly in `proxy.connection.client.address`. ([Bug#43313](#))
- Result sets with more than 250 fields could cause MySQL Proxy to crash. ([Bug#43078](#))

- MySQL Proxy was unable to increase its own maximum number of open files according to the limit specified by the `--max-open-files` option, if the limit was less than 8192. When set to debug level, Proxy now reports the open files limit and when the limit has been updated. ([Bug#42783](#))
- MySQL Proxy crashed when connecting to a MySQL 4.0 server. Now it generates an error message instead. ([Bug#38601](#))
- When using the `rw-splitting.lua` script, you could get an error when talking to the backend server:

```
2008-07-28 18:00:30: (critical) (read_query) [string
"/usr/local/share/mysql-proxy/rw-splitting.l..."]:218: bad argument #1 to 'ipairs' (table
expected, got userdata)
```

This led to Proxy closing the connection to the configured MySQL backend. ([Bug#38419](#))

- When using MySQL Proxy with multiple backends, failure of one backend caused Proxy to disconnect all backends and stop routing requests. ([Bug#34793](#))

D.9.5. Changes in MySQL Proxy 0.7.0 (Not Released)

Functionality added or changed:

- Support for using a configuration file, in addition to the command-line options, has been added. To specify such a file, use the `--defaults-file=file_name` command-line option. See [Section 14.6.3, “MySQL Proxy Command Options”](#). ([Bug#30206](#))
- A number of the internal structures developed for use with Lua scripts that work with MySQL Proxy have been updated and harmonized to make their meaning and contents easier to use and consistent across multiple locations.
 - The address information has been updated. Instead of a combined `ip:port` structure that you had to parse to extract the individual information, you can now access that information directly. For example, instead of structures providing a single `.address` item, you now have these items: `name` (the combined `ip:port`), `address` (the IP address), and `port` (port number). In addition, all addresses now supply both the `src` (source) and `dst` (destination) socket information for both ends of connections.

Some familiar structures have been updated to accommodate this information:

- `proxy.connection.client.address` is `proxy.connection.client.src.name`
- `proxy.connection.server.address` is `proxy.connection.server.dst.name`
- `proxy.backends` is now in `proxy.global.backends`. The `.address` field of each backend is an address-object as described earlier. For example, `proxy.backends[1].address` is `proxy.global.backends[1].dst.name`.
- The `read_auth()` and `read_handshake()` functions no longer receive an `auth` parameter. Instead, all the data is available in the connection tables.

In `read_handshake()`, you access the information through the global `proxy.connection` table:

0.6	0.7
<code>auth.thread_id</code>	<code>proxy.connection.server.thread_id</code>
<code>auth.mysql_version</code>	<code>proxy.connection.server.mysql_version</code>
<code>auth.server_addr</code>	<code>proxy.connection.server.dst.name</code>
<code>auth.client_addr</code>	<code>proxy.connection.client.src.name</code>
<code>auth.scramble</code>	<code>proxy.connection.server.scramble_buffer</code>

In `read_auth()`, you can use the following:

0.6	0.7
<code>auth.username</code>	<code>proxy.connection.client.username</code>
<code>auth.password</code>	<code>proxy.connection.client.scrambled_password</code>
<code>auth.default_db</code>	<code>proxy.connection.client.default_db</code>
<code>auth.server_addr</code>	<code>proxy.connection.server.dst.name</code>

0.6	0.7
<code>auth.client_addr</code>	<code>proxy.connection.client.src.name</code>

- In the `proxy.queries:append()` function, a third parameter is an (optional) table with options specific to the this packet. Specifically, if you want to have access to the result set in the `read_query_result()` hook, you must set the `resultset_is_needed` flag:

```
proxy.queries:append( 1, ..., { resultset_is_needed = true } )
```

For more information, see [proxy.queries \[1338\]](#).

- `proxy.backends` is now in `proxy.global.backends`.

Bugs fixed:

- **Security Enhancement:** Accessing MySQL Proxy using a client or backend from earlier than MySQL 4.1 resulted in Proxy aborting with an assertion. This is because Proxy supports only MySQL 4.1 or higher. Proxy now reports a fault. ([Bug#31419](#))
- MySQL Proxy was configured with the `LUA_PATH` and `LUA_CPATH` directory locations according to the build host rather than the execution host. In addition, during installation, certain Lua source files could be installed into the incorrect locations. ([Bug#44877](#), [Bug#44497](#))
- Using MySQL Proxy with very large return data sets from queries could cause a crash, with or without manipulation of the data set within the Lua engine. ([Bug#39332](#))
- MySQL Proxy terminated if a submitted packet was smaller than expected by the protocol. ([Bug#36743](#))
- When using MySQL Proxy in a master-master replication scenario, Proxy failed to identify failure in one of the replication masters and did not redirect connections to the other master. ([Bug#35295](#))

D.9.6. Changes in MySQL Proxy 0.6.1 (06 February 2008)

Functionality added or changed:

- Fixed assertions on write errors.
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed error handling for socket functions on Windows.
- Added new features to `run-tests.lua`.

D.9.7. Changes in MySQL Proxy 0.6.0 (11 September 2007)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. ([Bug#30867](#))
- Added support in `read_query_result()` to overwrite the result set.
- By default, MySQL Proxy now starts in daemon mode. Use the new `--no-daemon` option to override this. Added the `-pid-file` option for writing the process ID to a file after becoming a daemon.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.

- Added test cases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global Lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed an assertion on `COM_BINLOG_DUMP`. ([Bug#29764](#))
- Fixed an assertion on result-packets like `[field-len | fields | EOF | ERR]`. ([Bug#29732](#))
- Fixed an assertion that MySQL Proxy raised at login time if a client specified no password and no default database. ([Bug#29719](#))
- Fixed an assertion at `COM_SHUTDOWN`. ([Bug#29719](#))
- Fixed a crash if `proxy.connection` is used in `connect_server()`.
- Fixed the `glib2` check to require at least `glib2` 2.6.0.
- Fixed an assertion at connect time when all backends are down.
- Fixed connection stalling if `read_query_result()` raised an assertion.
- Fixed length encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed an assertion when connecting to MySQL 6.0.1.
- Fixed decoding of length-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result sets.
- Fixed a memory leak when `proxy.response.*` is used.

D.9.8. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profiling` to `--proxy-skip-profiling`.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Added `inj.query_time` and `inj.response_time` into the Lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate result sets from a script.

Bugs fixed:

- Fixed mysql check in `configure` to die when `mysql.h` isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed a compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed a crash on fields longer than 250 bytes when the result set is inspected.
- Fixed a warning if `connect_server()` is not provided.
- Fixed an assertion when an error occurs at initial script exec time.
- Fixed an assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

D.9.9. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added `automake/autoconf` support.
- Added `CMake` support.

Appendix E. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

E.1. Restrictions on Stored Routines, Triggers, and Events

These restrictions apply to the features described in [Chapter 19, *Stored Programs and Views*](#).

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some [restrictions specific to stored functions](#) but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some [restrictions specific to triggers](#).

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some [restrictions specific to events](#).

SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.6, “SQL Syntax for Prepared Statements”](#), for a list of statements supported as prepared statements. Only the statements listed there are supported for stored routines, unless noted otherwise in [Section 19.2, “Using Stored Routines \(Procedures and Functions\)”](#).
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted, but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 12.7.3.3, “`SELECT ... INTO Statement`”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- `HANDLER ... READ` statements that invoke stored functions can cause replication errors. As of MySQL 5.5.7, such statements are disallowed.

Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see [Section 17.4.1.29, “Replication and Triggers”](#).
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
    DECLARE i INT DEFAULT 0;
    SELECT i FROM t;
    BEGIN
        DECLARE i INT DEFAULT 1;
        SELECT i FROM t;
    END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in [Section 19.7, “Binary Logging of Stored Programs”](#).

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

Debugging Considerations

There are no stored routine debugging facilities.

Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers are not supported.
- `FOR` loops are not supported.

Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See [Section 19.7, “Binary Logging of Stored Programs”](#).

Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. ([Bug#16409](#), [Bug#18896](#))
- As of MySQL 5.5.8, DDL statements on events are prohibited while a `LOCK TABLES` statement is in effect.
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also [Bug#16522](#).)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. ([Bug#16422](#))
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. ([Bug#16396](#))
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See [Bug#22830](#) for more information.)
- Generally speaking, statements that are not permitted in stored routines or in SQL prepared statements are also not permitted in the body of an event. For more information, see [Section 12.6, “SQL Syntax for Prepared Statements”](#).

E.2. Restrictions on Signals

`SIGNAL` and `RESIGNAL` are not permissible as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

`SQLSTATE` values in class '`04`' are not treated specially. They are handled the same as other exceptions.

E.3. Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

E.4. Restrictions on Subqueries

- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return M and N rows, respectively, the execution time becomes on the order of $O(M \times N)$, rather than $O(M+N)$ as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t ...) AS _t ...);
```

Here the result from the subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
 - For `expr IN (subquery)`, `expr` can be an n -tuple (specified using row constructor syntax) and the subquery can return rows of n -tuples.
 - For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of n -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
      -> WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support
'LIMIT & IN/ALL/ANY/SOME subquery'
```

- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is nonstandard (not permitted by the SQL standard). In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a, ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied,

rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col)
AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join enables the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

E.5. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section E.4, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is

prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT RAND();
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT NOW();
EXECUTE s;
```

The result returned by the `EXECUTE` statement is a random number, not the current date and time.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](#).

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is the modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

E.6. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limita-

tion of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

E.7. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2`, `utf16`, and `utf32` character sets have the following restrictions:
 - They cannot be used as a client character set, which means that they do not work for `SET NAMES` or `SET CHARACTER SET`. (See [Section 9.1.4, “Connection Character Sets and Collations”](#).)
 - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
 - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
 - The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

E.8. Performance Schema Restrictions

Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `SETUP_XXX` tables.

Tables in the `performance_schema` database cannot be indexed.

Results for queries that refer to tables in the `performance_schema` database are not saved in the query cache.

Tables in the `performance_schema` database are not replicated.

Performance Schema is not available in `libmysqld`, the embedded server.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

E.9. Limits in MySQL

This section lists current limits in MySQL 5.5.

E.9.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

E.9.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table (regardless of storage engine) has a maximum row size of 65,535 bytes. `BLOB` and `TEXT` columns are counted at one to four plus eight bytes per column toward the row size limit because the contents of these columns are stored separately from the rest of the row. Storage engines may place additional constraints on this limit, reducing the effective maximum row size.

The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate $255 \times 3 = 765$ bytes per value. Consequently, a table cannot contain more than $65,535 / 765 = 85$ such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

`BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

Declaring columns `NULL` can reduce the maximum number of columns permitted. `NULL` columns require additional space in the row to record whether their values are `NULL`.

For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
    + (sum of column lengths)
    + (number of NULL columns + delete_flag + 7)/8
    + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. `delete_flag` is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for `InnoDB` tables, for which storage size is no different for `NULL` columns than for `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
-> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
-> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBS, is 65535. You have to change some
columns to TEXT or BLOBS
```

- Each table has an `.frm` file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the `.frm` file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- `info_length` is space needed for “screens.” This is related to MySQL’s Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.

- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for `ENUM` and `SET` columns.
- `com_length` is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
 - `InnoDB` permits no more than 1000 columns.
 - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
 - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

E.9.3. Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Process memory**

On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` option.

- **Limited number of ports**

Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Note that ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

For more information about this problem, see <http://support.microsoft.com/default.aspx?scid=kb;en-us;196271>.

- **DATA DIRECTORY and INDEX DIRECTORY**

The `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows, because MySQL does not support Windows symbolic links. These options also are ignored on systems that have a nonfunctional `realpath()` call.

- **DROP DATABASE**

You cannot drop a database that is in use by another session.

- **Case-insensitive names**

File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See [Section 8.2.2, “Identifier Case Sensitivity”](#).

- **Directory and file names**

On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

```
datadir="C:/私たちのプロジェクトのデータ"
```

The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The “\” path name separator character**

Path name components in Windows are separated by the “\” character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with “/” characters:

```
mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
```

Alternatively, you must double the “\” character:

```
mysql> LOAD DATA INFILE 'C:\\tmp\\\\skr.txt' INTO TABLE skr;
mysql> SELECT * INTO OUTFILE 'C:\\tmp\\\\skr.txt' FROM skr;
```

- **Problems with pipes**

Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z / CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

This is mainly a problem when you try to apply a binary log as follows:

```
C:\> mysqlbinlog binary_log_file | mysql --user=root
```

If you have a problem applying the log and suspect that it is because of a `^Z / CHAR(24)` character, you can use the following workaround:

```
C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
C:\> mysql --user=root --execute "source /tmp/bin.sql"
```

The latter command also can be used to reliably read in any SQL file that may contain binary data.

maximum memory used, [Description](#)
maximums
 maximum columns per table, [Section E.9.2, “The Maximum Number of Columns Per Table”](#)
 maximum tables per join, [Section E.9.1, “Limits of Joins”](#)
medium-check option
 myisamchk, [Section 4.6.3.2, “myisamchk Check Options”](#)
 mysqlcheck, [Description](#)

memlock option
mysqld, [Section 5.1.2, “Server Command Options”](#)

memory usage
myisamchk, [Section 4.6.3.6, “myisamchk Memory Usage”](#)

memory use, [Section 7.11.4.1, “How MySQL Uses Memory”, Description](#)

Performance Schema, [Section 21.2.2, “Performance Schema Startup and Runtime Configuration”](#)

metadata
database, [Chapter 20, INFORMATION_SCHEMA Tables](#)
stored routines, [Section 19.2.3, “Stored Routine Metadata”](#)
triggers, [Section 19.3.2, “Trigger Metadata”](#)
views, [Section 19.5.4, “View Metadata”](#)

metadata locking
transactions, [Section 7.10.4, “Metadata Locking Within Transactions”](#)

method option
mysqlhotcopy, [Description](#)

methods
locking, [Section 7.10.1, “Internal Locking Methods”](#)

min-examined-row-limit option
mysqld, [Section 5.1.2, “Server Command Options”](#)

min_examined_row_limit system variable, [Section 5.1.4, “Server System Variables”](#)

minus
unary (-), [Section 11.6.1, “Arithmetic Operators”](#)

mirror sites, [Section 2.1.3, “How to Get MySQL”](#)

miscellaneous functions, [Section 11.15, “Miscellaneous Functions”](#)

mixed statements (Replication), [Section 17.4.1.28, “Replication and Transactions”](#)

modes
batch, [Section 3.5, “Using mysql in Batch Mode”](#)
modulo (%), [Section 11.6.2, “Mathematical Functions”](#)
modulo (MOD), [Section 11.6.2, “Mathematical Functions”](#)

monitor
terminal, [Chapter 3, Tutorial](#)

monitoring
threads, [Section 7.12.5, “Examining Thread Information”](#)

mysql2mysql, [Section 4.7.1, “mysql2mysql — Convert mSQL Programs for Use with MySQL”](#)

multi mysqld, [Section 4.3.4, “mysqld_multi — Manage Multiple MySQL Servers”](#)

multi-byte character sets, [Section C.5.2.17, “Can't initialize character set”](#)

multi-byte characters, [Section 9.3.3, “Multi-Byte Character Support”](#)

multi-column indexes, [Section 7.3.5, “Multiple-Column Indexes”](#)

multi_range_count system variable, [Section 5.1.4, “Server System Variables”](#)

multiple servers, [Section 5.6, “Running Multiple MySQL Servers on the Same Machine”](#)

multiple-part index, [Section 12.1.11, “CREATE INDEX Syntax”](#)

multiplication (*), [Section 11.6.1, “Arithmetic Operators”](#)

mutex-deadlock-detector option
mysqld, [Section 5.1.2, “Server Command Options”](#)

my.cnf file, [Section 17.4.1, “Replication Features and Issues”](#)

my_bool C type, [Section 22.9.1, “C API Data Structures”](#)

my_bool values
printing, [Section 22.9.1, “C API Data Structures”](#)

my_init(), [Section 22.9.8.1, “my_init\(\)”](#)

my_print_defaults, [Section 4.7.3, “my_print_defaults — Display Options from Option Files”, Section 4.1, “Overview of MySQL Programs”](#)

config-file option, [Description](#)
debug option, [Description](#)
defaults-extra-file option, [Description](#)
defaults-file option, [Description](#)
defaults-group-suffix option, [Description](#)
extra-file option, [Description](#)
help option, [Description](#)
no-defaults option, [Description](#)

verbose option, [Description](#)
version option, [Description](#)

my_ulonglong C type, [Section 22.9.1, “C API Data Structures”](#)

my_ulonglong values
printing, [Section 22.9.1, “C API Data Structures”](#)

myisam-block-size option
mysqld, [Section 5.1.2, “Server Command Options”](#)

myisam-recover option
mysqld, [Section 5.1.2, “Server Command Options”, Section 13.5.1, “MyISAM Startup Options”](#)

myisam-recover-options option
mysqld, [Section 5.1.2, “Server Command Options”, Section 13.5.1, “MyISAM Startup Options”](#)

myisam_block_size myisamchk variable, [Section 4.6.3.1, “myisamchk General Options”](#)

myisam_data_pointer_size system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_ftdump, [Section 4.6.2, “myisam_ftdump — Display Full-Text Index information”, Section 4.1, “Overview of MySQL Programs”](#)

count option, [Description](#)
dump option, [Description](#)
help option, [Description](#)
length option, [Description](#)
stats option, [Description](#)
verbose option, [Description](#)

myisam_max_extra_sort_file_size system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_max_sort_file_size system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_mmap_size system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_recover_options system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_repair_threads system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_sort_buffer_size system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_stats_method system variable, [Section 5.1.4, “Server System Variables”](#)

myisam_use_mmap system variable, [Section 5.1.4, “Server System Variables”](#)

myisamchk, [Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”, Section 4.1, “Overview of MySQL Programs”](#)

HELP option, [Section 4.6.3.1, “myisamchk General Options”](#)
analyze option, [Section 4.6.3.4, “Other myisamchk Options”](#)
backup option, [Section 4.6.3.3, “myisamchk Repair Options”](#)

Thread States

Waiting for release of readlock, [Section 7.12.5.2, “General Thread States”](#)
Waiting for scheduler to stop, [Section 7.12.5.9, “Event Scheduler Thread States”](#)
Waiting for schema metadata lock, [Section 7.12.5.2, “General Thread States”](#)
Waiting for slave mutex on exit, [Section 7.12.5.7, “Replication Slave SQL Thread States”](#), [Section 7.12.5.6, “Replication Slave I/O Thread States”](#)
Waiting for stored function metadata lock, [Section 7.12.5.2, “General Thread States”](#)
Waiting for stored procedure metadata lock, [Section 7.12.5.2, “General Thread States”](#)
Waiting for table, [Section 7.12.5.2, “General Thread States”](#)
Waiting for table level lock, [Section 7.12.5.2, “General Thread States”](#)
Waiting for table metadata lock, [Section 7.12.5.2, “General Thread States”](#)
Waiting for tables, [Section 7.12.5.2, “General Thread States”](#)
Waiting for the next event in relay log, [Section 7.12.5.7, “Replication Slave SQL Thread States”](#)
Waiting for the slave SQL thread to free enough relay log space, [Section 7.12.5.6, “Replication Slave I/O Thread States”](#)
Waiting for trigger metadata lock, [Section 7.12.5.2, “General Thread States”](#)
Waiting on cond, [Section 7.12.5.2, “General Thread States”](#)
Waiting on empty queue, [Section 7.12.5.9, “Event Scheduler Thread States”](#)
Waiting to finalize termination, [Section 7.12.5.5, “Replication Master Thread States”](#)
Waiting to get readlock, [Section 7.12.5.2, “General Thread States”](#)
Waiting to reconnect after a failed binlog dump request, [Section 7.12.5.6, “Replication Slave I/O Thread States”](#)
Waiting to reconnect after a failed master event read, [Section 7.12.5.6, “Replication Slave I/O Thread States”](#)
Waiting until MASTER_DELAY seconds after master executed event, [Section 7.12.5.7, “Replication Slave SQL Thread States”](#)
Writing to net, [Section 7.12.5.2, “General Thread States”](#)
allocating local table, [Section 7.12.5.3, “Delayed-Insert Thread States”](#)
checking permissions, [Section 7.12.5.2, “General Thread States”](#)
checking privileges on cached query, [Section 7.12.5.4, “Query Cache Thread States”](#)
checking query cache for query, [Section 7.12.5.4, “Query Cache Thread States”](#)
cleaning up, [Section 7.12.5.2, “General Thread States”](#)
closing tables, [Section 7.12.5.2, “General Thread States”](#)
converting HEAP to MyISAM, [Section 7.12.5.2, “General Thread States”](#)
copy to tmp table, [Section 7.12.5.2, “General Thread States”](#)
creating table, [Section 7.12.5.2, “General Thread States”](#)
deleting from main table, [Section 7.12.5.2, “General Thread States”](#)
deleting from reference tables, [Section 7.12.5.2, “General Thread States”](#)
discard_or_import_tablespace, [Section 7.12.5.2, “General Thread States”](#)
end, [Section 7.12.5.2, “General Thread States”](#)
executing, [Section 7.12.5.2, “General Thread States”](#)
freeing items, [Section 7.12.5.2, “General Thread States”](#)
got handler lock, [Section 7.12.5.3, “Delayed-Insert Thread States”](#)
got old table, [Section 7.12.5.3, “Delayed-Insert Thread States”](#)
init, [Section 7.12.5.2, “General Thread States”](#)
insert, [Section 7.12.5.3, “Delayed-Insert Thread States”](#)
invalidating query cache entries, [Section 7.12.5.4, “Query Cache Thread States”](#)
logging slow query, [Section 7.12.5.2, “General Thread States”](#)
login, [Section 7.12.5.2, “General Thread States”](#)
manage keys, [Section 7.12.5.2, “General Thread States”](#)

optimizing, [Section 7.12.5.2, “General Thread States”](#)
preparing, [Section 7.12.5.2, “General Thread States”](#)

Section 10.1.4, “Data Type Default Values”
Description
Section 7.1, “Balancing Portability and Performance”
Section 11.14, “Information Functions”
Section 13.6.9.6, “Locks Set by Different SQL Statements in InnoDB”
Section 5.2.4.4, “Logging Format for Changes to mysql Database Tables”
Section 1.8.4, “MySQL Extensions to Standard SQL”
Section 12.6, “SQL Syntax for Prepared Statements”
Section 5.1.2, “Server Command Options”
Section 12.2.10, “Subquery Syntax”
Section 13.12, “The ARCHIVE Storage Engine”

REPLACE . . . SELECT

Section 13.6.5.3.2, “Configurable InnoDB Auto-Increment Locking”

RESET

Section 12.4.6.3, “FLUSH Syntax”
Section 12.4.6.6, “RESET Syntax”
Section 1.8.4, “MySQL Extensions to Standard SQL”
Section 12.3.3, “Statements That Cause an Implicit Commit”

RESET MASTER

Section 12.4.6.3, “FLUSH Syntax”
Section 12.5.1.2, “RESET MASTER Syntax”
Section 12.4.5.35, “SHOW SLAVE STATUS Syntax”
Section 22.9.3.55, “mysql_refresh()”
Section 17.3.6, “Switching Masters During Failover”
Section 5.2.4, “The Binary Log”

RESET QUERY CACHE

Section 7.12.5.4, “Query Cache Thread States”

RESET SLAVE

Section 12.5.2.1, “CHANGE MASTER TO Syntax”
Section 12.4.6.3, “FLUSH Syntax”
Section 12.5.1.2, “RESET MASTER Syntax”

Section 12.5.2.3, “RESET SLAVE Syntax”
Section 12.4.5.35, “SHOW SLAVE STATUS Syntax”
Section 22.9.3.55, “mysql_refresh()”
Section 17.1.3.3, “Replication Slave Options and Variables”
Section 17.1.3, “Replication and Binary Logging Options and Variables”
Section 1.5, “What Is New in MySQL 5.5”

RESIGNAL

Section 12.7.2, “DECLARE Syntax”
Section 12.7.8.2.1, “RESIGNAL Alone”
Section 12.7.8.2.4, “RESIGNAL Requires an Active Handler”
Section 12.7.8.2, “RESIGNAL Syntax”
Section 12.7.8.2.2, “RESIGNAL with New Signal Information”
Section 12.7.8.2.3, “RESIGNAL with a Condition Value and Optional New Signal Information”
Section 12.7.8, “SIGNAL and RESIGNAL”
Section E.2, “Restrictions on Signals”
Section 1.5, “What Is New in MySQL 5.5”

RESTORE

Section E.1, “Restrictions on Stored Routines, Triggers, and Events”
Section 5.3.4, “Security-Related mysqld Options”
Section 5.1.2, “Server Command Options”
Section 5.1.4, “Server System Variables”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 1.5, “What Is New in MySQL 5.5”

RESTORE TABLE

Section 7.11.3.1.2, “Using Symbolic Links for Tables on Unix”
Section 1.5, “What Is New in MySQL 5.5”

RETURN

Section 12.1.12, “CREATE PROCEDURE and CREATE FUNCTION Syntax”
Section 12.7.7, “RETURN Syntax”
Section E.1, “Restrictions on Stored Routines, Triggers, and Events”

REVOKE

Section 12.4.1.2, “DROP USER Syntax”
Section 12.4.6.3, “FLUSH Syntax”
Section 12.4.1.3, “GRANT Syntax”
Section 12.4.1.5, “REVOKE Syntax”
Section 5.4.5, “Access Control, Stage 2: Request Verification”
Section 17.1.2.1, “Comparison of Statement-Based and Row-Based Replication”
Section 5.3.1, “General Security Guidelines”
Section 7.11.4.1, “How MySQL Uses Memory”
Section 11.14, “Information Functions”
Section 5.2.4.4, “Logging Format for Changes to mysql Database Tables”
Section 1.8.5, “MySQL Differences from Standard SQL”
Section 5.4.2, “Privilege System Grant Tables”
Section 5.4.1, “Privileges Provided by MySQL”
Section 5.5.7, “Proxy Users”
Section 17.4.4, “Replication FAQ”
Section 17.4.1.20, “Replication of the mysql System Database”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Section 5.4, “The MySQL Access Privilege System”
Section 5.5.1, “User Names and Passwords”
Section 5.4.6, “When Privilege Changes Take Effect”

REVOKE ALL PRIVILEGES

Section 12.4.1.3, “GRANT Syntax”
Section 5.4.1, “Privileges Provided by MySQL”

ROLLBACK

Section 13.6.13, “InnoDB Error Handling”
Section 12.3.5, “LOCK TABLES and UNLOCK TABLES Syntax”
Section 12.3.4, “SAVEPOINT and ROLLBACK TO SAVEPOINT Syntax”
Section 12.3.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”
Section 22.9.3.3, “mysql_change_user()”
Section 19.7, “Binary Logging of Stored Programs”
Section 13.1, “Comparing Transaction and Nontransaction Engines”
Section 13.6.9.8, “Deadlock Detection and Rollback”
Section 13.6.5.1, “Using InnoDB Transactions”
Section 11.14, “Information Functions”
Section 12.3.5.1, “Interaction of Table Locking and Transactions”
Section 12.3, “MySQL Transactional and Locking Statements”
Section 17.1.3.3, “Replication Slave Options and Variables”
Section 17.4.1.28, “Replication and Transactions”
Section C.5.5.5, “Rollback Failure for Nontransactional Tables”
Section 5.1.4, “Server System Variables”
Section 12.3.2, “Statements That Cannot Be Rolled Back”
Section 12.3.3, “Statements That Cause an Implicit Commit”
Chapter 13, *Storage Engines*
